the African continent. Physiology compels a retrospect far beyond historical periods of time for the establishment of these varieties. Geology lends her aid in expanding our conceptions of time past in relation to the existence of the source of these varieties—the last, highest organic form that “naked and on two legs” trod the earth. What evidence, not merely faith-exciting but knowledge-giving, have we of the earliest manifestations of Assyrian or Semitic civilisation—that is to say, of literature, architectural and sculptural art, established ritualistic religion, priest and warrior castes, administrative officials—parallel in time with the evidence of such which Egypt has yielded? The Hycsos kings, in the course of their 500 years’ usurpation of the delta, accepted the civilisation, the arts of the higher race which they had partially subdued. When finally driven out—and they were pursued by the victorious Amosis as far as Palestine, as that pregnant contemporary record translated by M. Chabas teaches—they took with them such accession of ideas as they had acquired in Egypt. One invasion and conquest is the parent of another; the subjugated in turn becomes the subduer. The Amenophises, the Thothmes, extended the conquest of Amosis, the founder of their dynasty; they overran Palestine and pushed onward to the plains between the Euphrates and the Tigris, bringing back from the confederation of tribes of the subdued “Rotennou,” such slaves as they wanted for their mighty works in Egypt. In that hard school were trained additional teachers of the Assyrian and neighbouring populations. But how far above and beyond these glimpses of possible outward courses of the stream of Egyptian civilisation stands its native source, brightly flowing through the first twelve dynasties, thousands of years before the time of Menepthah, the Pharaoh of the Exodus! These are the considerations which must weigh with the philosophical ethnologist and historian in propounding any theory worthy of acceptance of the origin of Egyptian monarchy, or of the priority thereto of Chaldean civilisation. It would be no exaggeration, in view of the conditions of Woodward’s bequest to Cambridge, and those under which the gifted Buckland wrote his *Reliquiae Diluvianae*, and beneath the social opprobrium that long hung over whomsoever ventured to interpret geological and palaeontological phenomena adversely to dogmatic chronologies and stories of physical phenomena, to lament the loss of a century or more in attaining our present glorious liberty of looking, thinking, and prophesying on the antiquity of our planet and of the creatures that have enjoyed thereon the powers and privileges of life. The ethnology of the so-called Semitic races of mankind seems not yet to have attained that liberty. She still, I fear, hugs her chains, or a remnant of them. I appeal, therefore, to my fellow Orientalists to cast away prepossessions as to time, place, affinity, race, for which there may not be rightly-observed, well-determined data, and to bring to bear on the dark vistas of the past in human history the pure dry light of science. After chemistry, no science has been so sorely tried as biology through changes of abstract terms; yet, when expressive of new and true generalisations and purgative of false notions, the gain has abundantly repaid and rewarded the trouble. Geology has abandoned the term “diluvial,” as applied, in relation to the Noachian deluge, to any sedimentary formation. In England we have found it inconvenient and misleading to use it even as an arbitrary designation. May the time be soon at hand when truer terms—and no one fitter to propound them than Max Müller—will be applied, in ethnology, to groups of peoples and of tongues now called respectively Hammonic, Semitic, and Japetic.

Dr. Forbes Watson then read an abstract of his paper on the “Establishment, in connexion with the India Museum and Library, of an Indian Institute for Lecture, Enquiry, and Teaching.” Dr.

Forbes Watson observed, that in an assembly of Orientalists he need not dwell on the vastness of the field on which the action of such an institution might be brought to bear. Professor Max Müller, in the eloquent address to which we listened on Thursday last, deplored the deficiency in the way of systematic provision for the prosecution of Oriental studies in England. The proposed Institute would in part at least tend to remedy this deficiency, more especially as regards the practical application of Indian studies, though it might also contribute to the progress of Oriental scholarship. Referring to the paper itself for the necessary details, he proceeded to give a short sketch of the main features of the proposed Institute, and of its probable usefulness. The leading idea of the Institute is, that as the Museum and Library will contain classified materials referring to the whole of India’s past and present condition, there should be established chairs for lecture and enquiry, for the purpose of securing the systematic utilisation of these materials. An Indian Museum composed of special groups and divisions, each complete in itself, and each representing a distinct feature either of the country or of the people, would be admirably adapted for the purposes of such an Institute.

As regards lectures, the field naturally divides itself into three sections, each possessing a character of its own, and requiring a special mode of treatment, viz.:—

- (1) Indian geography and statistics.
- (2) The products and manufactures of India.
- (3) History and literature of India.
- (4) Indian law and administration.

There are also other subjects which are scarcely of general interest, but which are essential to the training required by many people going out to India in a practical, official, or scientific capacity. To this group belongs the study of the various languages: Sanskrit, Pali, Arabic, Persian, Hindustani, and the other vernaculars. Under the same head comes also a special study of Indian botany, zoology, and geology. What is wanted in these subjects are not lectures, but teaching classes for the use of those who really desire to acquire a mastery of the subject.

Finally, the Institute, especially taken in connexion with the Royal Asiatic Society, which forms an important link between this country and India, and which for many reasons should be located in the same building as the museum and library, will afford a favourable opportunity for meetings and conferences on various questions bearing on the economical and social progress of India.

Thus the action of the Institute on the public will take place through the fourfold machinery of permanent lectureships, of occasional lectures, of teaching classes, and of public conferences.

The use of the Institute for the training of the candidates for the Civil Service of India is a question treated at some length in the paper itself. Without entering, therefore, into greater detail, it will suffice to mention that at present the candidates, after passing the competitive examination, are subjected to a two years’ training in languages and other Indian studies bearing on their future career. The advantages which the lectures and classes of the Institute might afford during this period are obvious.

Professor Léon de Rosny gave some account of the more important results of studies carried on during fifteen years whilst writing his *Histoire de la Race Jaune*. After referring to the uncertainty of the present philological study of the so-called Turanian languages, he proceeded to explain the phonetic value of the Japanese dictionaries, in which is found the pronunciation of the many words the Japanese borrowed from the Chinese exactly as they were pronounced at the time immediately succeeding the age of Confucius. M. de Rosny has endeavoured with some success to apply this discovery to the interpretation of ancient Chinese inscriptions, and to difficult passages in the

sacred books of China which even the native interpreters cannot explain. M. de Rosny then remarked upon the extreme poverty of the ancient Chinese language, and the necessity which the modern and civilised Chinese were under of enlarging their language, in order to express their thoughts. M. de Rosny has been able to reduce the roots of the Chinese language to the number of 6,000, and in these 6,000 roots he sees the true means of a comparison between the Chinese and the languages of Central Asia.

On the Castes and on Certain Customs of the Dards. By Frederic Drew. The author divided the Dards into the following castes:—

Ronü. . . . Shin; Yashkun; Kremin Düm.

Putting aside the highest, the Ronü, as limited and perhaps local, he began by showing that the Düm were low in social status, and that, like the Marasis and the Domes of India, they were occupied as musicians. From this he was led to think that they were remnants of the Pre-Aryan race, though hitherto the existence of that race had not been recognised among the higher parts of the Himalayas. The conclusion was fortified by the fact that among neighbouring and intermediate nations there exists a low caste with more or less similar pursuits, for instance, the Bätals in Kashmir, and the Bems in Ladakh, to all of whom the author ascribed a similar origin.

The Kremin were analogous to the Südra of India, and were probably of mixed blood between that of the Düms and that of the higher castes. The Yashkun and the Shin form the mass of the people, and are the Dards proper.

The Shin were distinguished by a peculiar custom. They held the cow in abhorrence, would never drink its milk or come in contact with it more than was absolutely necessary.

Some of the Dards had, by contact with the Tibetans of Ladakh, become Buddhist. These probably came in an early wave of immigration. Of these again part had lost their Dard speech and acquired the Tibetan.

On the whole, the conclusion was that the progenitors of the Shin and the Yashkun had come from the north-west or north to their present seat—the country north of Kashmir—subduing those whose descendants now constituted the lower castes.

It was then announced by Dr. Birch that the Council of the Congress had decided to hold the next Congress in Russia, under the presidency of Count Woronzow, the Minister of Public Instruction. On this point no discussion was taken, and it was declared to be carried.

Fifth Report of the Royal Commission on Scientific Instruction and the Advancement of Science.

THIS Commission has now been sitting for a little more than four years, and has proved its industry by presenting a succession of reports, which deal each in a final manner with a separate portion of its enquiries. The present Report treats of “certain institutions of recent voluntary origin and mainly dependent on voluntary support, which have made arrangements for advanced instruction in science.” These institutions are: University and King’s Colleges, London; Owens College, Manchester; the College of Physical Science, Newcastle-upon-Tyne; and the Catholic University of Ireland. The origin, growth, constitution, and present condition of these bodies are described in a concise but adequate manner, and much interesting information is given with regard to their financial state, and finally certain recommendations are made with reference to the advisability of granting to them Government assistance. On this latter point the Commissioners appear to have laid down two principles for their guidance, that no scientific institution should receive public aid unless it has both gained a permanent position, of its own, and also is free from all religious restrictions. As a consequence of these two

principles it follows that the Newcastle College, which was founded barely three years ago, and is still very poor, must "wait for more local subscriptions and a better organisation before it is placed in a position to establish its claim to assistance from the State;" and the Irish University, because of its indelible religious character, and its financial weakness, is hopelessly precluded from expecting a grant from public funds. With reference, however, to the two metropolitan colleges and Owens College, the Commissioners are of opinion that their success has established for them "a claim to the aid of Government which ought to be admitted;" and they suggest that to all these three colleges aid should accordingly be given, "both in the form of a capital sum to enable them to extend their buildings where requisite, and to provide the additional appliances for teaching which the advance of scientific education has now rendered absolutely necessary; and also in the form of an annual grant in aid of the ordinary working expenses of the colleges." This annual grant is afterwards more definitely explained to be "for the augmentation of the stipends of certain professorships, the payment of demonstrators and assistants, or payments in aid of the laboratory and establishment expenses." Of the expenditure of these annual grants, Government would receive a yearly account, but otherwise the general management of the colleges is to remain uncontrolled. It should be added, that with regard to King's College these recommendations are conditional upon its reconstitution in such a manner as to "extinguish the proprietary rights of its shareholders, and to abolish all religious restrictions on the selection of professors of science, and on the privileges extended to students of science."

Such is the substance of the conclusions at which the Commissioners have unanimously arrived, but apart from their recommendations there is much material for comment scattered throughout their report. No reader can fail to be struck by the circumstance that bodies which teach a great deal besides physical science are treated as if no other part of their teaching were of any national importance, and that the schools of medicine in connexion with these bodies are also passed over. This limitation is of course due to the bounds originally placed upon the province of the Commission, but the strictness with which it has been observed must cause the whole subject to be reconsidered when any practical steps are taken by Parliament in accordance with this report. It is also curious to observe that the boys' schools both at University and King's College are in a most flourishing condition, and actually yield a surplus for the general funds of the institutions, and that King's College would hardly be kept afloat if it were not for the financial success of the Theological and Literary Departments. It is noteworthy, too, that the chair of Chemistry is uniformly more highly salaried than the others; and that on the average the Government professors at the School of Mines and the Cooper's Hill College are not better paid than those of these voluntary institutions. In conclusion, the Report bears abundant testimony to the liberality of voluntary effort. None of these colleges has been in existence so long as fifty years, yet with the exception of the infant college at Newcastle, they have each expended on capital account sums of money varying between 180,000*l.* and 250,000*l.*; and setting aside the Catholic University, as standing in a peculiar position, they all seem nearly to pay their way out of their endowments and pupils' fees. That they have not yet attained to their full development may well be admitted, and also that they are considerably hampered for lack of funds; but with a knowledge of the above facts the ordinary taxpayer will be disposed to keep most of his admiration for University and Owens Colleges, neither of which seem to have made any application for Government aid.

SIR COOMARA SWAMY's translation of the Pali work *Sutta Nipāta*, which contains many of the sermons and discourses of Gotama Buddha, is now ready for publication. It is expected to be out in a couple of weeks. The introduction to it, we learn, deals with an interesting central idea of Eastern philosophy and Buddhism.

ANOTHER translation by the same writer, of *Tāyumanava*, dealing with the Vedantic and Sidantic Schools of Indian Philosophy, will be out early next year. We shall look forward with deep interest to another publication with which Sir Coomara is now supposed to be engaged, *An Eastern's Impression of Western Civilisation*.

A SECOND edition of Dr. Caldwell's *Comparative Grammar of the Dravidian or South Indian Family of Languages*, on which he has been engaged for the last four years, is now, we are informed, ready for the press. The book has been out of print for many years. The second edition has been carefully revised and considerably enlarged.

FINE ART.

THE PAINTINGS FOR THE DECORATION OF THE NEW OPERA HOUSE BY M. PAUL BAUDRY.

Paris: Sept. 10, 1874.

THE exhibition of M. Paul Baudry's paintings for the decoration of the New Opera is of sufficient importance to deserve notice in two different aspects—first, with regard to art in general, and in this sense international; and, secondly, as a specimen of the work of the students of the Ecole des Beaux-Arts, which is more especially French.

Allow me to reverse this order, and, after taking you in detail through this exhibition, which just now is producing a great sensation in Paris, to end with a few general reflections. My great wish is to be sufficiently lucid and earnest to persuade some of your eminent artists to come themselves to study a work which, although the product of our old school of art, fortunately belongs, with all its grace and firmness, to the innovations of the present day.

Paul Baudry was born, in the year 1829, at La Roche-sur-Yon, in La Vendée. His family belonged to the class of artisans. While very young he showed so much talent for drawing that the prefect of his department obtained for him a small pension, which enabled him to study in Paris. He became a pupil in the studio of Drolling, and afterwards in the Ecole des Beaux-Arts, and worked with such extraordinary perseverance, that at twenty-one he obtained the grand prize at the Roman Academy—an almost solitary instance at that age.

The designs sent by him while a student at the Villa Medici were much noticed, especially the *Young Child with Fortune*, now in the Luxembourg Gallery. Accomplished critics stood astonished in front of this picture. The figure of Fortune is taken from Titian, and that of the child seated on the edge of the well from Raphael's *Triumph of Galatea*; but the transparent colouring, the flowing outline, and the delicacy of touch are entirely due to the merits of the artist. Afterwards, while under the influence of Leonardo da Vinci, he accomplished a literal masterpiece of grace and poetry, a Leda standing in front of a dark wood, courted by the divine swan. The *Wave and the Pearl*, which would undoubtedly have borne the palm in the Salon of 1863 if the Academicians had not made every effort to exalt the insipid Venus of M. Cabaud, is in colour, attitude, and expression, an incomparable masterpiece of the sensuous school of modern art. His portraits of Guizot, of Beulé, of an actress, Mlle. Jeanne Essler, and many others, are distinguished by first-rate qualities, which influential criticism (now entirely in the hands of the Academy) has not honoured with sufficient notice. Lastly, M. Baudry, besides other decorations, has painted a splendid ceiling in M^{me}. de Paiva's house in the Champs Elysées.

I mention only his principal works. Their

number is considerable, but they are too little known and appreciated by the public, which seldom sees M. Baudry's name in the annual exhibitions. Since he received from his friend, M. Charles Garnier, the order for these decorations, which will cover a space of 500 mètres, he has shut himself up in his vast atelier, established in the roof of the New Opera House. He lives there a real artist's life, leaving it only to make upon the spot, in Rome, Florence, Panna, or London, the copies or studies from Michael Angelo, Primaticcio, Corregio, and Raphael, which he requires to perfect his work.

His person is short and thickset; his complexion is dark, and his large head gives him a somewhat common appearance. He is not communicative, except in a small circle of political friends or old fellow-students. He is perfectly disinterested. He must not be held responsible for the somewhat vulgar notoriety excited by the exhibition of his works, which gave great offence to the public. I can give no opinion as to his conversation, having met him only once, when I visited his studio to ask him to lend some of his pictures to embellish an exhibition organised by the Society of the Friends of Art at Bordeaux, and to which he contributed a few portraits. He has just published in a newspaper a eulogistic article on Schnetz, formerly Director of the Roman School of Art, which he read a short time ago at a sitting of the Ecole des Beaux-Arts. The style is easy. He tells very agreeably some anecdotes which point to the life of old Schnetz, whose hospitable apartments have often been visited by his distinguished fellow-countrymen, and who made acquaintance with, and obtained as his models the most picturesque brigands in the Abruzzi and the Campagna. This notice of the life and works of Schnetz (in the *Dix-Neuvième Siècle* of September 2) does not contain any particularly new doctrine; it is an echo of what was formerly called in literature the "school of common sense." M. Baudry laughs at "the taste for a false ideal and the conventional spirit which continually return to attack art in France like a periodical epidemic." On the other hand, he ridicules the term "realism," which in the beginning "expressed a tangible idea, but which has fallen so low that one hesitates now to employ it." He declares that he does not like revolutions in Art, but that an impartial historian ought not to decry them indiscriminately, for they have a special property for extinguishing certain faculties in the most gifted men in order to develop others." This proposition, incontrovertible in itself, is rather obscure when applied to Granet and Géricault, who were eminently impressionable men. He is evidently an eclectic philosopher. The condemnation of this doctrine, which is more convenient than true, seems to us to be contained in the exclamation of Schnetz, who entering one day the studio of Baudry, and seeing on an easel a sketch of *Diana surprised in bathing*, cried out:—"Well, but the figure is too smooth, too much the same all the way down." Baudry excused himself with a principle in fashion in aesthetic lectures and classical studios, "Unity." "Oh yes, I understand," replied Schnetz, "Unity: there are a great many unities in the present day—of nations, of taxes, and of commerce. Allow me at least to adhere to the federation in favour of rose-tinted bosoms and knees, and blue-veined extremities."

These criticisms may be applied to all these decorations. The tone is clear, pure, pleasant to the eye as a bunch of wistaria or a branch of lilac blossoms, with a sober, quiet background in the taste of old tapestry. It is delicate without meagreness, refined without affectation, pale without being washed out. But it wants those powerful touches which light up a whole picture, and which our artists call so appropriately *des réveils*. M. Baudry, with an original inspiration for which we are willing to pardon many omissions, gives brightness and life to his pictures by

the animated expression of the face and the brilliancy of the eyes. Perhaps he makes too much use of the eyes rounded like balls which he has admired in the pictures of Correggio. But this proof of the influence exercised by an admirable painter whose broad and delicate genius has been too much thrown into the shade by Raphael, seems to me to indicate a taste as artistic as it is intelligent. By this new element, and by his appreciation of female beauty, M. Baudry may exercise a useful influence over the present school of decorative artists.

It is feared lest the delicate effect of this painting should evaporate like the vapour of a perfume when the canvas is fixed at a great height in conspicuous carved gold frames. The architect ought to have foreseen this and have given practical advice to his friend. What is much more to be dreaded is the action of gas upon these paintings. The lobby will require 800 burners. The heat and disengaged vapours will be considerable. It has been proposed to have this painting copied by ordinary decorators. I suggested, in the *République Française*, having them rendered one by one in tapestry from the Gobelins manufactory. I fear that neither of these proposals will be adopted, and that these originals will have only a few years' existence.

There are three ceilings. In the middle of the great central ceiling, which is square, Melody and Harmony embraced are rising into the sky. On the left floats Glory, on the right is Poetry borne upwards by Pegasus. A group of geniuses play round the representation of a balustrade, which unites this glimpse into Heaven with the real building. On one of the oval corners of the ceiling is a figure of Tragedy. Melpomene is seated on a tripod; at her feet an eagle, a bird of prey, threatens the world. On the right Fear; on the left Mercy, in the act of supplication.

The subject of the other ceiling is Comedy. This is the artist's greatest success. It is, in my opinion, an incomparable masterpiece of soft brilliancy and delicate playfulness. Even the French school of the eighteenth century did not equal it in expression. An old faun, covered with black hair, ostentatiously clad in a lion's skin, is scaling Olympus. But Thalia keeps watch over the bores. She has thrown him over. He rolls, furious and grotesque, from cloud to cloud. Thalia tears off his lion's skin, and slaps him in fits of laughter. Wit, a bright flame on his forehead, bends his bow and pierces the faun with sharp darts like the stings of wasps. Love, frightened by the uproar, flies away laughing. The whole thing is as clear, as gay and as delightful as the scenes of genteel comedy in Regnard, for instance.

Let us now turn to the eight Muses, which seem to me the most original and modern portion of this great work. They are in the places intended for eight eagles, which were to have spread their wings in the eight corners. The Republic came at the right time for the fame of the artist, set the eagles free, and substituted for them eight charming young female figures draped and arranged with exquisite taste. The faces are varied and lifelike, for they are taken from those young maidens and mothers whose feeling and intelligence are the gentle and attractive attributes of our Gallican race. These figures are a glorious monument of the age, and will never be out of date, for the skill of the artist has fixed in them both the characters of the present time and the perennial spirit of the French.

Melpomene is thoughtful: Erato is hiding a love-letter in her bosom; Clio holds the heroic trumpets; Urania, a charming child, raises her eyes to the starry vault; Euterpe is listening to distant music; Thalia is inventing some trick against her jealous guardians; Terpsichore, out of breath, is bending to adjust her sandal; Calliope is pensively meditating over a line of Virgil,

"O passi graviores, Deus dabit his queque finem."

In ten round medallions M. Baudry has traced

large figures of children holding an instrument, singing and playing. With a somewhat confused and unnecessary use of allegory, they symbolise Persia, Rome, Greece, Egypt, savage nations, Great Britain, Germany, Italy, France, and Spain. A rather vague connexion unites them with the subject of the vaultings.

These subjects naturally have reference chiefly to music as they are intended to gratify the eyes and minds of the audience when they go out between the acts of the opera.

The Judgment of Paris has only a distant relation to music, but the artist seems to have been anxious to display some fine naked figures. The excuse is sufficient. The group of the three goddesses is less perfect as regards female beauty than the Three Graces on Mount Parnassus. But the action is good, especially that of the revengeful Juno.

"Marsyas" exhibits the preparations for flaying; "The Assault," warriors excited by clarions; "The Shepherds," recalls the peaceful rivalries in Sicily when Theocritus led the song. David is standing by moonlight at the entrance of the tent of Saul; he touches his harp to the king, who is lying restless on his couch; St. Cecilia is listening in her sleep to the songs of the angels. On one side Orpheus distracted with grief sees Mercury bearing away in his arms the floating shade of Eurydice; on the other, Orpheus is thrown down by the Maenads, who are about to tear him in pieces. The Corybantes are dancing and clashing their shields to smother the cries of the infant Jupiter. Lastly, Salome is executing before Herod, who is reclining at the banquet, the dance full of treacherous voluptuousness by which she will obtain the head of John the Baptist. On the two extremities are painted Mount Parnassus and the Poets.

Mount Parnassus is the great classical effort of M. Baudry. Apollo is alighting from his golden chariot, and seizing with feverish eagerness the ivory lyre held out to him by the Graces. The Muses are wandering, conversing with each other, or pensively meditating, on the slope of the sacred mount, at the foot of which, cold and clear as an academical oration, flows the stream of Hippocrene. On the left, behind the laurels, and rather embarrassed by their costume and position, are seen the musical composers of our own day, or a little earlier—Meyerbeer, Rossini, Hérold, Auber, Boieldieu, Méhul, Beethoven, Gluck, Haydn, Rameau, Lulli. Mozart, with more self-possession, engages a conversation with Erato, who responds languidly. On the right, quite in the corner, are sketched the profiles of Messrs. Paul Aubry, Charles Garnier, and Ambroise Baudry—an architect who has, it seems, assisted in the decoration of the New Opera House.

The Poets are treated with less precision and harmony. The conception is confused. At the bottom, on the steps of an ancient Doric temple, we see the blind Homer. Higher up, a young man, who seems about to fall upon the spectators, and is brandishing a sword and a javelin, represents Achilles "opening the road to the civilisation of Europe." Other figures symbolise the different functions of poetry and conditions of society by attributes and actions which are not more expressive or consistent than those adopted by the Germans in their aesthetic compositions. At this period of his work, which passed through the terrible years 1870-71, M. Baudry was evidently tired. To his honour be it said that he formed one of the noble group of French artists who would not abandon their metropolis. He went bravely through his duties as a member of the National Guard during the siege.

There are two elements in his genius. One is due to nature, and the other to training. His academical education has taught him to study continually the sketches of other artists, to copy literally figures from the antique, from Raphael, Primaticcio, Rembrandt, and even from the works of his teacher, Deloing. It has taught him to be

satisfied with imaginative subjects, which have been a thousand times repeated, instead of searching in modern science and criticism for ideas less hackneyed than the subjects of ancient mythology. It has taught him to use too vivid flesh tints, and has diverted his attention from the great effects of landscape.

But his natural genius spurred him to shake off their yoke in the field of expression. Here lies his forte. It is here that he has conquered new plains for the cultivation of high art, cosmopolitan as well as French.

PH. BURTY.

KENNY MEADOWS.

THE name of Kenny Meadows is unfamiliar in the ears of the present generation. Many persons in reading the short notices in the newspapers of his death, will have asked, "Kenny Meadows—who is he?" But to those who knew the genial, kindly old artist, his name will bring back memories of days when he formed one of a brilliant company of authors, artists and actors, most of whom have long since passed away. Leigh Hunt, Laman Blanchard, Douglas Jerrold, Dickens, Thackeray, Stanfield, Roberts, and the Landseers, were among his most intimate friends; and in the merry evenings, when these congenial associates met together, and wit ran sparkling along the wires of talk, not a few of its flashes were emitted by the jovial illustrator of Shakspeare, who was ever ready with some apt quotation from his favourite author. Several of the notices that have appeared of him have been written as though he were only entitled to a sort of reflected glory from these distinguished friends; but this is scarcely fair, for although his art falls below the high aims of the present day, it must be remembered that in his own time he achieved considerable celebrity as a book illustrator, and was one of the first to introduce wood engraving among English publishers as a means of cheap and popular illustration. For years his friend the late Mr. Ingram employed his talent in the Christmas numbers of the *Illustrated News*, and he was always eagerly sought after as an illustrator of children's books and fanciful stories.

But the chief ambition of his life was to bring out an illustrated edition of Shakspeare, and this he at last accomplished in 1842-45 with great success. The wit and fancy of his art, its chief characteristics, here had unbounded room for exercise, and his fanciful and original designs for this work are by far the best things he ever drew. So popular at the time was his conception of Falstaff, that a bronze statuette was modelled after it in Germany and had a large sale.

The *Heads of the People* was another popular work, to which Thackeray and Jerrold contributed some of their earliest sketches, and the fact is noteworthy, that these literary sketches were written to the pictures and not, as some have imagined, the pictures drawn in illustration of the letterpress.

During the last ten years of his life Kenny Meadows had the benefit of a pension from the Civil List of 80*l.* a year, but he continued to work at his art, and was engaged, we are told, upon a painting from a Shaksperian subject within a few months of his death. Up to the last, indeed, he was a hale and vigorous old man, very proud of his age, and wont to declare that there was "life in the old dog yet." Though he has outlived so many of his early friends, there are still some left, we may hope, who will "tak a cup o' kindness yet" in memory of Kenny Meadows and "auld lang syne." As there have been several mistakes made concerning his age, it may be as well to state that his baptismal register attests that he was born at Cardigan, in South Wales, on November 1, 1790. He was the son of a retired naval officer.

MARY M. HEATON.

ARAB ART MONUMENTS.

IN another column will be found an account of the discussion which took place in the Archaeological section of the International Congress of Orientalists on the motion of Mr. E. T. Rogers, late Consul at Cairo, to appoint a committee "for the preservation and restoration of monuments of Oriental art and architecture, and for duly recording those monuments which are decaying or which cannot be restored." It remains to be seen whether the Council will nominate the committee or not. In the meanwhile, it may be well to say a few words on the main object of the motion—or rather the main object of those who sympathise with the motion, for the proposer himself did not fully bring out the most important, because the most practicable, part of the idea. The first part of the motion is, indeed, of the utmost consequence; but things which are of the utmost consequence are not always practicable; and such, we fear, is the case with Mr. Rogers's proposal that steps should be taken towards preserving and restoring the monuments. Such a proposal could only be carried out by a Government measure; and the reception which was accorded, in the Lower House, to Sir John Lubbock's Bill for the preservation of English historical monuments is not a very propitious augury for the success of a measure relating to the preservation of Arab monuments. Besides, such a measure would involve very delicate negotiations with the Khedive, who is the principal sinner in the matter of art-demolition, and the negotiations, we may confidently prophesy, would end in smoke. If anyone is to move in this matter it is the Khedive himself; and the Europeanizing tendencies of his Highness do not favour the supposition that he would be willing to take any steps in the conservative direction. He would perhaps ask whether Parisian boulevards and Italian villas planted in the historical soil of Egypt were not more artistic than tumble-down mosques and ruined houses? And would it be possible, even with the temper of an angel, to answer such a question?

But these difficulties in the way of the preservation of the monuments seem to us to give double importance to the second part of the motion, briefly referred to as "duly recording those monuments which are decaying and which cannot be restored." Mr. Rogers did not appear to see fully the value of this part of his motion, but in the eyes of those like himself, lovers of Eastern art, who originally suggested to him the idea of making an appeal to the Congress, this part was more important, though it sounds almost paradoxical to say so, than the preservation of the monuments themselves. They knew the difficulty awaiting any attempt at the latter object; but the virtual preservation of these monuments by representations they conceived would be both practicable and efficient. The scheme was that proper persons should be appointed to take photographs, or make drawings or casts, according to the nature of the objects, of every example of Arab art they could find. This process would be greatly facilitated by the large number of existing photographs of mosques and other buildings, which would only have to be carefully identified on the spot, and made scientifically valuable by precise description as to the point of view from which they were taken, and any other condition necessary to the correct interpretation of the photographs in after years. Of course, the total number of photographs, drawings, and casts would necessarily be very large, for the object would not be gained unless every part of a building—the exterior from every available side, the interior, different parts of the interior, the ornamentation, tracery, inscriptions, tiles—was completely represented, so that in short the monument might be re-created in the mind of the student long after the original had been destroyed. Every drawing or photograph should be accompanied by accurate descriptions, giving minute details as to the size, colour, state of pre-

servation, etc., of the object. By this means we should have in England a large collection of records of Arab art—an Eastern Art-quarry. We must now see what we could do with our quarry.

The system and growth of Arab architecture, the art in which the Arabs achieved most success, are subjects with regard to which we are utterly in the dark. And our ignorance is most complete where our knowledge should begin; we do indeed know something, just a little, about Indian and Moresque architecture, both of which are exaggerated or even debased forms of the Arab; but of the mother of both these, of Arab architecture itself as seen in Egypt, we know absolutely nothing. Of course we look at the mosques with conventional admiration. But this is not *knowing*. We do not really *know* anything about the development of Arab architecture. That there was a gradual growth, as in Gothic, is evident if we compare the style of an early mosque, for instance, that of Ibn-Tuloun, with the style of any of the mosques of the Memlook Sultans. But to map out the different periods of the art, and to endeavour to deduce a system, has never seriously been attempted. If, however, we had the quarry to work upon which the collection of representations to which we have referred would supply, the elaboration of the theory of Arab architecture must follow. And when once the true place of each object had been indisputably found, the whole collection, or at least a large selection of the more important part of it, should be given to the world in the form of a History of Arab Architecture, which could be illustrated by the collection by means of one of the photographic printing processes, such as the Autotype, which has lately been brought to such perfection. Such a work would be of inestimable service to art-students of the future, who without it would have to do what they could with the present meagre, yet cumbersome, publications which have approached the subject, but from the wrong end—the Moresque. The man who perhaps in all England is likely to do most for the study of Arab art, and architecture especially, by his grasp of the subject and enthusiasm for it—we mean Mr. Caspar Clarke, of the South Kensington Museum, at present in Persia, once expressed a wish that a handbook of Arab architecture should be written, corresponding to Parker's admirable *Introduction to the Study of Gothic Architecture*, and that thus the Arab school should be put on the same footing as the Gothic and Classical. Such a book might easily be compiled when once the "History of Arab Architecture," to which we have referred, is written. And students would then have the opportunity—which at present they have not—of studying the Eastern styles as easily as the Western, and it would then be their own fault if people insisted upon looking at architecture through Gothic or Classical spectacles. By thus putting the study of Arab architecture on the same footing as the study of Gothic, we should virtually be preserving the Arab monuments in the most effectual way possible.

STANLEY LANE POOLE.

NOTES AND NEWS.

A REPLICA in bronze of Mr. John Bell's group "America," on one of the angles of the Prince Consort Memorial, in Hyde Park, is proposed at Philadelphia as a detail of the centennial commemoration of American Independence.

At the meeting of the Archaeological section of the Congress of Orientalists that took place last week at the Royal Institution, the chairman, Mr. Grant Duff, M.P., stated that Mr. Burgess, the learned editor of the *Indian Antiquary*, was preparing a report of his survey of the Rock Temples of Eastern India. This survey was undertaken for the Bombay Government in 1872, and its results are awaited with much interest by those who make Indian archaeology their study.

UNDER the auspices of the Working Men's

Club and Institute Union, a series of lectures is now being delivered on the principal Classes in the London International Exhibition. To-day, a lecture on "Ancient and Modern Bookbinding" is to be given by Mr. Henry T. Wood in the West Theatre of the Albert Hall.

THE *Revista de Archivos* of September 15 contains a continuation of Señor Codera's notes on the coins of the Arabic dynasties in Spain.

HANNS MACKART, Piloty's pupil, has sent his great painting of *Abundantia*, which two years ago had created such a sensation in Germany, to London, where it will be exhibited from November 1st at the Dutch and German Gallery in Pall Mall. To know Mackart at his best, his *Genre-Scenes*, which were in the Kunsthalle of the Vienna Exhibition, should be seen.

A life-size portrait of Prince Bismarck, by Carl Otto, whose *Triumph of Bacchus* is now exhibited at the Munich Gallery, is shortly to arrive at the same gallery. Professor Comraeder's *Death of Emperor Joseph II. of Austria*, which was the best canvas in the whole gallery (except Kaulbach's) has been sold to the Emperor of Austria for his private collection in the Belvedere, and has already been removed.

THE Berlin Photographic Company, having received order from the King of Saxony to take photographs from the greatest works in the Dresden Gallery, is about to issue 300 sheets of photographic reproductions of the paintings by Rafael, Da Vinci, Correggio, Titian, Palma, Paolo Veronese, Guido Reni, Giorgione, Velasquez, Murillo, Poussin, Claude Lorraine, Rubens, Teniers, Van Dyck, Rembrandt, Diirer, Kranach, Holbein, Mengs, and others. The first volume published at Berlin is about to leave the press. The Director of the Dresden Gallery, Herr Hübner, has written the accompanying text. The Photographic Society will also make an edition with English text, which will be ready about Christmas.

A WEEKLY Art paper styling itself the *Journal Général des Beaux-Arts et des Arts Industriels* has just been started in London under the direction of M. de Roy de Sainte-Croix, a gentleman who has hitherto exercised his peculiar talents in the Brussels *Journal des Beaux-Arts*. The new journal is written principally in French, but when the translation of articles into French "presents difficulties," they will be published, we are told, "in the idiom in which they are written." In the grandiloquent "profession of faith" put forward by the editor, he assures society that his opinions are cosmopolitan in their tolerance. "Notre pays, notre patrie, notre royaume, notre drapeau se résume en un seul mot, l'art—l'art indépendant et libre, l'art qui élève la société," &c. Very fine sentiments, only what we really find under this flaunting flag is art debased into an advertising agent; at least, so bombastic and fulsome are the praises lavished on certain works and tradespeople, that one can only form such a conclusion. When, for instance, we are told in an article on the "Mobilier de Salon" that a certain firm in Oxford Street, whose name and address are given, "connaissent à fond ce qui convient à chaque meuble," that a chapter in a book called *Petit Manuel d'Art* does not contain a word that is not "noble and great," and that the *Magasin Pittoresque* is "one of the most beautiful and useful publications of the age," it is difficult to believe that the criticism is of such an entirely disinterested character as to raise it above the voluminous literature of the wastepaper basket. We should have had nothing to say against such a publication as this had it been put forward by the second half only of its title; but when it arrogates to itself the position of a critical art journal, we feel it only fair to warn unsuspecting persons of its true character. A list of the editor's "works published in London" appears among the advertisements. It consists almost entirely of pamphlets written in the interest of tradespeople.

MR. SIGMUND MENKES has retired from the *Journal Général des Beaux-Arts et des Arts Industriels*.

IN St. Hans Kirke, at Hjörning, a little town in Jutland, recent alterations have brought to light a great number of interesting mural paintings dating from the end of the twelfth century. The whitewash which has disfigured the walls for centuries is being very carefully removed, and the results will probably be of no small historical interest. One painting, representing St. Christopher carrying the divine Child over the stream, has already been completely uncovered. The church is one of the oldest as well as the prettiest in Denmark.

A PARAGRAPH in the *Daily News* of last Saturday calls attention to the fact that the monument to Bunyan in Bunhill Fields, erected by public subscription in 1862, is already in a very dilapidated state. The figure of Bunyan is crumbling away in places, and much wanton injury has been done to the bas-reliefs.

THE number of provincial exhibitions now open exceeds all previous efforts of this kind. Besides those already mentioned, three more were opened last week in England, and one at Inverness in aid of a fund for establishing a school of science and art and a museum in that town.

A SPECIAL exhibition of enamel work has been arranged at the South Kensington Museum, and is now open to the public.

FOUR important Egyptian statues in sculptured wood have recently been added to the Louvre collection. Three of these statues belong to the earliest Egyptian dynasties, but the fourth is apparently of a more recent date. The Viceroy of Egypt sent a statue somewhat similar to the largest of these to the Paris Exhibition of 1869, but with this exception no work of this kind belonging to the earlier epochs of Egyptian art has ever found its way to Europe.

A SERIES of old tapestries representing the history of Jeanne d'Arc has recently been found at the ancient castle of Espanel, near Molières. The tapestries were executed, it is supposed, at the beginning of the seventeenth century. There could not have been a more propitious moment for their discovery than the present, when Jeanne d'Arc is the heroine *à la mode* in Paris.

AN International Exhibition has positively been decided upon in China, and a committee formed at Shanghai for the purpose of organising it, with the English Consul as its president. Messrs. John Bourne and Co., of Mark Lane, have also been chosen as agents, so as to give every guarantee to European exhibitors. All charges of transport will be defrayed by the committee.

AT this year's exhibition of new paintings which has just been opened at Berlin, a "toile," by Franz Defregger, the celebrated painter of country life, has made the greatest hit. The title is *Das letzte Aufgebot in Tyrol* (The Last Call to Arms in Tyrol), and the subject, like one of Defregger's earlier works, taken from the Franco-Austrian war in 1809. E. Ranzoni, the excellent critic of the *Neue Freie Presse*, pronounces it to surpass, not only the artist's former picture *Speckbacher*, painted a few years ago, but even his celebrated *Tanz auf der Alm*. Next this, a painting of English history (Lindenschmidt), *Walter Raleigh and his Family in the Tower*, attracted the greatest attention.

THE restoration of the Town Hall at Cologne has been completed, and this interesting building, which belongs to the middle of the sixteenth century, has now recovered much of its original character. It underwent considerable alterations in 1590, when the large hall, which had been intended for a flax exchange and a place of conference with foreign and other persons of distinction, was enlarged and arranged for great festivals and for the meeting of the Rhenish-Westphalian

provincial delegates and other public functionaries. In 1750, the municipality determined to have the hall decorated according to the taste of their times, when an open-worked iron balcony was erected in front of the window and adorned with copper heads and medallions. In 1764 it received a valuable addition to its internal decorations in the purchase by the magistrates of a set of splendid Gobel tapestries, which had originally been presented by Louis XIV. to the Elector Palatine Maximilian Heinrich, and were finally disposed of after the death of his descendant the Elector Clemens August in 1760. These six Gobelines, which represent battlefields and camp life with all the spirit and style of Anton Franz van der Meulen, are still in a state of perfect preservation. The last touch has been put to the restoration of the grand old banquetting-hall by the re-hanging of these splendid specimens of tapestry, whose beauty is enhanced by the success with which the decorations of the ceilings and walls have been made to harmonize through the design and execution of their allegorical and emblematic ornamentation with the subjects of the Gobelines.

M. GALICHON has sent to the *Gazette des Beaux-Arts* a copy of a sketch by Michael Angelo, in his possession, which represents the fall of Phaeton. The drawing had previously been known only through Ottley's very imperfect copy, of which this would appear to be the original. On the margin is written in Michael Angelo's hand an enquiry addressed to Tommaso dei Cavalieri, whether the composition satisfies him, and a request that Tommaso will send word by his servant what he thinks of the design.

It would appear that the sketch did not meet with Cavalieri's satisfaction, for it is obvious from Beatrizet's engraving that the composition was altered, and there is, moreover, according to a writer in *Preussische Jahrbücher* (August, 1874), a third variation of the original design, which is in the Academy at Venice, and has recently been photographed by Naya. In the Venice copy the horses alone are fully worked out, while the other figures have been left in mere outline, and a variation in the attitude of the river god is perceptible, for instead of lying as a passive and uninterested spectator of the catastrophe, as in the other copies, he is represented with upraised arms as if in the act of receiving the falling body of Phaeton.

THE French Art journals are speaking with patriotic exultation of the genius of the young painter Eduard Detaille, who after having exhibited some of his early sketches for the first time in 1869, and taken part in the 1870-71 campaigns as secretary to General Pajol, has now come forward as an original and spirited delineator of battle-scenes and camp life. E. Detaille, who was born in 1848, showed his natural bent at an early age by covering every book and slate that came in his way with figures of soldiers in all conceivable poses of action and repose. In 1865 he became the pupil of Meissonier, and devoted himself with considerable application to the study of his art. Since his return to the life of a civilian he has again employed himself in painting, or rather etching, and his sketches of scenes from the war are pronounced by Germans competent to pass an opinion on them, to be marvellously true to reality. His special success is said to consist in the perfect truthfulness with which he has caught up and reproduced the national and marked peculiarities of the different German troops, not a trait of individuality having escaped his keen observation, or eluded his delicate power of reproduction.

THE STAGE.

IN fulfilment of her engagement, Miss Lydia Thompson has reappeared in London, at the Charing Cross Theatre. A burlesque which has been performed five hundred times by this blithe lady, in America, forms the staple of an entertain-

ment which is rather to be enjoyed than criticised. A strict adherence to given rules of composition is hardly the characteristic of any burlesque: least of all of that version of *Blue Beard* now acted at the Charing Cross; for this is a performance frankly designed for the diversion of the many. By this means or by that—by the attraction of a song that is sure to be encored, of a dance sure to be applauded, of dresses that sparkle with all the jewels of the inexhaustible East, of a man who out-Woodins Mr. Woodin in the rapidity of his transformations, of a humour which because it is not English and familiar may, if it please you, be accepted as Chinese—by all these means the Town is to be drawn: London is to be compelled to come in. Nor does London seem particularly slow to accept the invitation; and in accepting the invitation it may note something more than the strange things which it has been asked to see: it may note the difference between the burlesque acting of Miss Thompson and that of too many of the sisters of her craft. For six years this actress has been absent from the London stage. It is longer ago than that, however, since she was first the potent attraction of the stage of burlesque, and her theatre the point towards which converged the lines of hansoms that started, after dinner-time, from Pall Mall and Piccadilly. Subsequent experience proves that Miss Lydia Thompson's admirers of those days were not bad critics, after all. Those gentlemen knew what they were going to see, and did not hurry off in hansoms for nothing. They were sure of a performance that would be sunny and pleasant. In its peculiar line, Miss Lydia Thompson's success has not been undeserved. At the Charing Cross her reception has been entirely cordial.

DURING the week Mdle. Beatrice and her travelling company, now located at the Haymarket, have been appearing in a pretty accurate translation of *Nos Intimes*; a translation which differs in this respect from the version of the piece played many years since at the Saint James's under the title *Friends or Foes*. *Friends or Foes* was a favourite piece with an elegant actress of comedy—Miss Herbert—and it has for the London playgoer an additional interest of association, in that it is the piece which during a brief illness of Miss Herbert's first afforded to Miss Kate Terry, in early youth, the means of making her mark. In France, the chief character—that of the heroine—is linked with the name of an entirely accomplished *comédienne*, Madame Fargueil, and the performance of Madame Fargueil in the part has been seen in London; so that Mdle. Beatrice, at the Haymarket, has had more than one strong *souvenir* to contend with, and it is greatly to her credit that her performance has been in many ways successful and artistic. She has been well seconded by Mr. Vernon and Mr. Wenman. *Nos Intimes* has quite truly been pronounced the wittiest and most pungent play of a once brilliant author—Monsieur Sardou—but it has two separate sources of interest; one, the sketches of the confiding host's fair-weather friends, whose presence justifies the title; and the other, the attachment, passing into intrigue, which exists between the youthful guest and the somewhat less youthful wife. The "simple and credulous" *bonhomie* of the husband is a thing excellently conceived and portrayed.

THE Prince of Wales's Theatre re-opened on Saturday, with the performance of *The School for Scandal*, which was given during the London season. A little comedy by Mr. Gilbert is understood to be in preparation.

THE new performance of *Two Roses*, which constitutes the main feature in the Vaudeville programme for the autumn, will be criticised next week in the ACADEMY.

A LITTLE domestic drama by Mr. Arthur A'Beckett, called *Faded Flowers*, will be produced this evening at the Haymarket. On Monday a new extravaganza, by Mr. Farnie, will be brought out

at the Strand; and on the same evening the Globe will open under the management of Mr. Fairlie, late of the St. James's, who will bring with him the Saint James's pieces of last season—the boisterous *Vert-Vert*, and Mr. John Oxenford's skilful adaptation of Mrs. Henry Wood's best known novel.

VICTOR SÉJOUR, a dramatist well known in Paris, died last Sunday, and was buried a couple of days afterwards in Père La Chaise, attended to his grave by the troop of sudden friends whom custom summons to every French funeral. Séjour was successful in his youth, and he failed in his middle-age. If he is to be remembered, it will be by one sensational drama, *Le Fils de la Nuit*, and one spectacular drama, *La Prise de Pékin*. His later works were crowded off the stage by Offenbach's music and by dances of women dressed as fishes and birds, for he catered for the theatres which these things have invaded, and not for the Français, the Gymnase, or the Vaudeville. He lived at last poor and neglected, and had to die in order that the *feuilletonistes* might recollect that he had existed.

THE honours of the performance of *Gilberte* at the Gymnase Theatre have fallen, not so much to the authors, Messieurs Gondinet and Deslandes, as to Mlle. Delaporte, the actress who, after an absence of ten years or so, has come back from St. Petersburg to act for twenty nights at the Gymnase. Her reception was naturally sympathetic, and was awarded by a most brilliant audience; the leading actress of the Gymnase, Mlle. Blanche Pierson, applauding from a private box. It has long been recognised by the best judges that Mlle. Delaporte is one of the first actresses of comedy in Europe: a mistress of her art, who obtains from her art every legitimate effect, and never forces it out of its proper province. Her entire understanding of every character she assumes, and her subtle expression of contained emotion, place her as the equal not only of Mlle. Pierson herself, but of Delaporte's now departed comrades, Rose Chéri and Desclée. The new piece *Gilberte* is in four acts, which appear somewhat lacking in continuity or unity of interest, for while in the beginning the interest is centred upon Gilberte as a daughter, it is transferred to her career as a wife. But judicious excisions since the first representation have to some extent removed this objection, and there is no doubt that the piece affords to Landrol and to Ravel as well as to Mlle. Delaporte an opportunity of exhibiting the excellence of their art.

WE understand that Mr. Clement O'Neil is the author of the English version of *Giroflé-Girofla* which is shortly to be produced at the Philharmonic Theatre.

THE Strand Theatre will perform, together with Farnie's new burlesque of *Loo, or the Party who took Miss*, still for some time Poole's comedy of *Paul Pry*, whose success continues, and afterwards produce a new comedy by Mr. Byron, under the name of *Old Sailors*, as a "pendant" to his *Old Soldiers*. The principal parts are written for Mr. C. H. Stephenson, Mr. Terry, Mr. Henry Cox, and Miss Ada Swanborough.

WE understand that Mr. Halliday's treatment of Scott's *Talisman*, in the new spectacular drama, *Richard Cœur de Lion*, to be produced to-night at Drury Lane is much like Mr. Matheson's in his *Talismano* libretto. The only difference is that in the drama the part of Saladin is made prominent. The Sultan appears in each of the first three acts in another disguise, and only in the last he assumes his real character. As in his previous stage adaptations, the author gives great opportunities for the development of scenic effects, such as processions, ballets, &c. Some of the characters, such as Saladin, Richard, Sir Kenneth, &c., are drawn with energetic features, whilst others, Edith Plantagenet, for instance, appear like a mosaic,

composed of many little details, which at first seem to be almost unimportant. Mr. Carl Meyder, the new musical conductor at Drury Lane, has composed a clever overture, and some ballet and march music, which will probably add to the general success of Mr. Andrew Halliday's newest adaptation.

A CORRESPONDENT in Vienna writes:—The Wiener Stadttheater, our best theatre after the Burgtheater, sustains a loss not easily to be repaired, through the resignation of the director, Dr. Heinrich Laube. As usual in such cases, a pecuniary matter was the principal cause of a disagreement between the director and the higher authorities. The Stadttheater was created by Dr. Laube, who was from 1850 to 1868 Director of the Burgtheater, so called because it is in the Emperor's "Burg" (Castle), itself. This theatre is among the German stages what the Comédie Française is among the French, and it had its best period during the eighteen years of Dr. Laube's management. When he, the author of *Die Karlsruhler, Graf Essex, Cato in Eisen*, and many another celebrated drama, retired from the Burgtheater on account of quarrels with the late General-Intendant Baron Münch-Bellinghausen (better known under his *nom de plume* Frederick Halm), Laube went to Leipzig, where he undertook the management of the Stadttheater, but soon came back to Vienna, his favourite town, and created the theatre which he now forsakes. Dr. Laube, one of the best actors of the Stadttheater company, has been entrusted with the provisional management, but several of the other principal members, the Professor of Oration, Herr Alexander Strakosch among them, have demanded to be released from their engagements. There is a rumour that Anton Ascher, who was once director of the Carl-Theater, and is now living in retirement, will be offered the managership.

THE Komische Oper (Opera Comique), which had closed its doors last season, has been leased by Herr Hasemann, one of the former directors, and will shortly be reopened. Following the example of the Paris Conservatoire, the Vienna Conservatorium der Gesellschaft der Musikfreunde (the same excellent school where the *prima donna* of Covent Garden Opera, Mlle. d'Angeri, received her musical education), has established a school for dramatic art in its higher forms. This new institution supplies a real want, because there was actually no such establishment existing, except a few private theatre-schools, which left very much to desire. The best actors from both the Burg- and the Stadttheater, like Herren Baumeister, Förster, Friedman, and the "Master of Oration," Herr Strakosch, will be professors of declamation; Mr. Price, solo dancer at the great Opera Ballet, will teach Mimic; Joseph Weilen, one of the most prominent dramatic authors of the day, has been appointed Professor of Literature, etc. It is altogether such an institution as would very well find its place in England. One of the next novelties of the Stadttheater will be an adaptation from Octave Feuillet's sensational drama, *Le Sphinx*.

HEINRICH LAUBE, during his stay at Carlsbad, has adapted Shakspeare's *Pericles* to the stage, and the piece is to be brought out at the Vienna Stadttheater in the course of the winter.

MUSIC.

NEW MUSIC.

WE have received from Messrs. Stanley Lucas, Weber, and Co., a parcel of their recent publications for review, consisting of songs and pianoforte pieces, which, though not requiring any very detailed criticism, are of sufficient interest to render them well worthy of a short notice in our columns.

Anton Rubinstein's songs may be said to be all but unknown in this country, and a selection of them with English words will surely be acceptable

to the large number of musicians who desire to keep themselves *au courant* with the music of the present day. Among the pieces now before us are the "Twelve Songs from the Persian of Mirza Schaffy," "The Forest Witch" ("Die Waldhexe"), and "Here's to thee, gentle Mary," all from Rubinstein's pen. Taken as a whole, these smaller compositions must be considered superior to the same author's larger works. In the latter is almost invariably to be found great diffuseness; and side by side with many interesting thoughts, a large amount of "padding." In these little songs, however, where a felicitous first idea is the great desideratum, Rubinstein is met with under more favourable circumstances. The Persian songs have a peculiar quaintness about them. With the view, doubtless, of imparting a local colouring to them, the composer has adopted quasi-oriental scales and unusual rhythms, very happy effects being obtained by the frequent use of the interval known as the "augmented second," as, for example, in the song "My heart is crowned with thee" (No. 2). It cannot be said that all the numbers are of the same merit—indeed, there are few more unequal writers than Rubinstein—but several of them are truly charming. Besides the song just referred to, No. 3, "When thy fairy feet delight my gaze," may be specified as remarkably original and pleasing from the freshness of its rhythms. No. 9, "Oh, could it remain so for ever," is another strikingly original number; and No. 11, "Look not so coyly," shows that Rubinstein can, when he chooses, write more simply and unaffectedly than most people would give him credit for. On the other hand, there are a few numbers in which the desire for originality leads to affectation and eccentricity, as for example on the last page of No. 6, in which the roudades with which the song ends are neither expressive nor beautiful. The song, "The Forest Witch," a fine piece of musical declamation, was sung several times in public last season by Miss Antoinette Sterling, with a success which the merits of the composition fully justify. "Here's to thee, gentle Mary," is a very pleasing little song, though hardly so striking as some of the others under notice.

It is not often that we have met with compositions from an English pen which have given us such real pleasure as four songs by Mr. H. A. Rudall, an accomplished amateur, who, however, needs no indulgence on that score, as his acquisitions would do no discredit to a professor. The only fear to be entertained with regard to Mr. Rudall's songs is, lest they should be too good to be popular. Their beauty is of a refined kind, appealing rather to the cultivated musician than to the average amateur. "The Days of Merry Spring-time," though not from a musical point of view by any means the best of the four, is likely to be the most acceptable to the majority of hearers; but the other three songs, the words of all of which are from Bailey's *Festus*, are of a very high order. "Ask me not to look and love" is a particularly elegant and expressive song, but the rest of the series can also be warmly recommended.

"Sonetto di Dante Alighieri," set to music by Hans von Bülow, Op. 22, is a very pleasing and flowing melody, which calls for no further comment.

Two songs for Mezzo-Soprano, by J. F. H. Read (No. 1 "Nydia's Love Song," No. 2 "A Regret for Childhood"), are very well written, and commendably free from commonplace. The first is possibly rather the more interesting of the two, but both contain good points.

Of "Three Songs," dedicated to Mr. Santley by Edmund T. Chipp, the first and second are before us. The first is an extremely simple yet very effective setting of Longfellow's poem, "The Curfew;" the second, entitled "Old Farewell Song," is more in the style of Schumann, whom, without servile imitation, Dr. Chipp would seem to have taken for his model.

"Ask me no more," song, with violoncello obbligato, by Oliveria L. Prescott, shows very considerable musical feeling, and when adequately rendered would be effective.

A series of four-part songs for mixed voices, may be briefly dismissed with the remark that it contains three pieces ("Lullaby of Life," "The Rainbow," and "The Angel's Visit"), by Mr. Henry Leslie, and two ("The Sun is bright" and "Summer Morning") by Mr. James Coward. Both these gentlemen are so well known for their skill in this particular species of composition that it will be sufficient to say that the present part-songs are not unworthy of the reputation of their writers, and will be found useful additions to the répertoires of choral societies.

There still remain to be noticed two pianoforte pieces. The first is a very bright and sparkling "Intermezzo Scherzoso," by Dr. Hans von Bülow, which with good playing cannot fail to please; and the other is a fantasia, by Wilhelm Kuhe, on themes from Glinka's opera, *Life for the Czar*, which is very pleasing in its subjects, and being treated in Mr. Kuhe's usual brilliant style, makes a very good drawing-room piece.

EBENEZER PROFT.

THE Liverpool Musical Festival commences on Tuesday next, under the direction of Sir Julius Benedict. The list of solo performers includes the names of M^{me}. Adelina Patti, M^{lle}. Albani, Miss Edith Wynne, Mrs. Weldon, M^{me}. Patey, Mr. Sims Reeves, Mr. Bentham, Mr. E. Lloyd, Herr Conrad Behrens, and Mr. Santley as vocalists; Miss Dora Schirmacher as solo pianist; and Herr Straus and Mr. Carodus as solo violinists. The orchestra will number over a hundred instrumentalists, with M. Sainton as leader, and Mr. W. T. Best at the organ, while the chorus will consist of above three hundred voices. The morning performances will consist of sacred, and the evening of secular music. The sacred works to be given are *St. Paul*, Gounod's new mass, "SS. Angeli Custodes," selections from the *Creation*, *Messiah*, *Judas Maccabæus*, and *Israel in Egypt*, and Sullivan's *Light of the World*, which will be conducted by the composer. The most important features of the secular concerts will be a new "Festival Overture" by Mr. G. A. Macfarren, and an orchestral work entitled "The Lay of the Last Minstrel" by Mr. J. F. Barnett, both composed expressly for the Festival, a festal march entitled "Edinburgh" by Professor Oakeley, Gounod's *Joan of Arc*, Mozart's symphony in G minor, Beethoven's "Pastoral," and Mendelssohn's "Italian" symphonies, and Mendelssohn's G minor concerto.

INTERESTING particulars as to the progress of Wagner's great Bayreuth enterprise appear from time to time in the German musical papers. A recent number of the *Signale* states that the composer has nearly finished the instrumentation of the last act of the *Götterdämmerung*, the concluding piece of the tetralogy, and that the close of this work is "the most colossal thing that the genius of the master has ever produced." Offers of singers and players come in from all sides. Wagner wishes to have all his singers tall, as having to represent chiefly gods and heroes, and thus far it is said he has been very successful. His Siegfried (Herr Glatz) and Brünnhilde (Frau Materna) are both of imposing stature. For the two giants, Fasolt and Fafner, after long search two singers of enormous height have been found, who, however, are both lean and will have to be padded. In Bayreuth, where it is well known that Wagner requires only tall singers, it has passed into a saying, if a tall man passes along the street, "There goes a Nibelung!" The full orchestral score of "Die Walküre," the second part of the work, has just been published by Messrs. Schott, of Mainz.

In connexion with the same subject, it will in-

terest many of our readers to learn that Mr. Alfred Forman has translated the whole of the drama *Der Ring des Nibelungen* into English, and that three of the four parts ("Rheingold," "Die Walküre," and "Siegfried") have been printed for private circulation. The translation of the *Götterdämmerung* is, we believe, also complete, but Mr. Forman is wisely keeping it back until the publication of the music. Our readers will form some idea of the difficulty of the task when we say that, not only is the original metre retained so that the English text fits the music, but that Mr. Forman has actually preserved the alliterative verse, which is a special feature of Wagner's poem. As a complete understanding of the drama is absolutely indispensable to the appreciation of the music, we hope that Mr. Forman will ere long publish his entire translation. Still more desirable is it that Messrs. Schott, the proprietors of the music, should bring out a cheap edition of the work with the English text in addition to the original German. By so doing, they would confer a great benefit on the large number of musicians in this country who are interested in Wagner's music, but who have not sufficient acquaintance with the German language to follow the original text. We trust that before the performances in 1876 such an edition may be issued.

HERR JOSEF RHEINBERGER, whose pianoforte quartett was produced with great success last season in London, is at present at work upon a new symphony, which, according to the *Musikalisches Wochenblatt*, an Italian musical society has commissioned him to write.

SIGNOR FOLI, the well-known bass, leaves England at the end of next week for St. Petersburg, where he will appear for the first time on the 12th of next month.

THE Viennese Ladies' Orchestra will leave at the end of next week for Manchester, where they have taken an engagement for twelve concerts.

WE learn from Vienna that M^{me}. Christine Nilsson (M^{me}. de Rouzaud) is expected in that city, or will by this time have arrived there. M^{me}. Nilsson intends to give the poor, "star"-neglected inhabitants of the great city on the blue Danube a proof of her high abilities, which are already acknowledged in London and in Paris, and which have made her a favourite with our Transatlantic cousins. M^{me}. Nilsson intends to appear either at the Hofopertheater (the Imperial Opera), or to arrange three concerts on her own account. It will be remembered that the Swedish songstress refused to appear in Berlin after the Franco-Prussian war, when she was wanted for the production of Ambroise Thomas' *Hamlet*, saying she feared to lose the favour of her Parisian admirers if she sang before a German audience.

THE Society of Musical Composers in France, under the presidency of Ambroise Thomas, Henri Reber, Félicien David, Victor Massé, and Vaucorbeil, have addressed a memorial to the National Assembly, complaining of the stagnation of the musical art in France, and the poverty of the repertoire of the lyrical theatre. It asks for greater activity on the part of the direction of the Opéra Comique, the rehabilitation of the Théâtre Lyrique on the Place du Châtelet, as well as larger subventions and greater encouragement for the choral and symphonic societies. The petition is signed by almost all the known composers in France.

How are the mighty fallen! Ilma di Murska, once the "star" of the Vienna Opera, and afterwards a favourite of English and American audiences, is now singing at the Polish National Theatre in Lemberg, one of the dirtiest towns in Galicia. Signor Naudin, the once-admired tenor, joins M^{lle}. Murska in these honours.

POSTSCRIPT.

THE project of connecting the three principal rivers of Western Germany—viz., the Rhine, the Ems, and the Weser—by a canal, is one of long standing, and has been recently again brought forward, more especially by persons interested in the coal industry and other important branches of production in Westphalia and Rhenish Prussia. It is said that the Prussian Government is inclined to lend its assistance towards the realisation of the project.

A BRANCH of industry which is gradually increasing in importance has arisen in late years in the barren moorlands of North-western Germany, by the preparation of peat (or turf), which is largely used as fuel in this part of Europe; and two companies have lately been formed in Oldenburg for the purpose of manufacturing peat on a large scale. The peat is cut out of the soil of the marshy moors or bogs by means of a large flat-bottomed steam-vessel, which is able to cut a canal twenty (German) feet in breadth and six feet in depth, whilst proceeding at the rate of from ten to twelve feet per hour. The soil thus cut out is deposited alongside of the bank of the canal, where it is subsequently cut into the shape of bricks, and then dried.

THE question of the best means to be employed for the conservation of woods and forests in Germany came before the Foresters' Congress held at Freiberg on September 5. The importance of the subject was universally admitted, and the extraordinary influence which a scientific and systematic method of management would have on the general physical and economic relations of the people at large was fully recognised. In Germany about 18 per cent. of all the woods are in the hands of communal and parish proprietors, and only 4 or 5 per cent. in those of the Imperial Government; hence until legislative enactments are brought to bear on this branch of landed property, no uniformity of system can be looked for. The next meeting of the Congress will be held in 1875 at Hanover.

TABLE OF CONTENTS.

SATURDAY, OCTOBER 3, 1874.

No. 126, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

LITERATURE.

The Ashanti War: A Narrative prepared from the Official Documents by Permission of Sir Garnet Wolseley, C.B., K.C.M.G. By Henry Brackenbury, Captain, Royal Artillery, Assistant Military Secretary to Sir Garnet Wolseley during the War, and formerly Professor of Military History at the Royal Military Academy at Woolwich. With Maps and Plans compiled from the Staff Surveys, &c., by Harry Cooper, Lieutenant, 47th Regiment, sometime Adjutant of Transport in the Campaign. (Edinburgh and London: Wm. Blackwood & Sons, 1874.)

ALTHOUGH the war on the Gold Coast was only brought to a conclusion on the 4th of February by the capture of Coomassie, no fewer than five different accounts of the campaign have been already published. With the exception of Captain Brackenbury's book, however, they are all written by special correspondents of the various newspapers. These, although interesting narratives of personal experience, do not pretend to give a complete history of the military operations. Captain Brackenbury's book is of a much more elaborate kind, full—perhaps too full—of details; and it deals with the whole question of the Ashanti difficulty in an exhaustive manner. The author enjoyed exceptional advantages as a chronicler of the war. From his position as military secretary to Sir Garnet Wolseley, he must have been in constant and close communication with him throughout, and have been in possession of full information with regard to the military situation in all its phases from first to last; and although, as he is careful to explain, the narrative is not an official one, and has not been revised, or even seen previous to publication, by Sir Garnet Wolseley or any of his staff, yet all official documents were placed at the author's disposal without reserve, and valuable data supplied by different officials.

Now this very intimate association of the historian with the chief actors in the events related, this derivation of all knowledge from official sources, is not an unmixed gain. It ensures a general accuracy as to facts, but is liable to bias the interpretation of them. And a defect of this kind may be traced throughout Captain Brackenbury's book. There is a want of independent and impartial criticism of military men and their work, a tendency to view every act of the commander, and every service of his subordinates in the most favourable light. Where others have found fault, Captain Brackenbury is ready with a warm defence, and mistakes and disasters are often lightly passed over, or excused as altogether unavoidable under the circumstances in which they occurred.

Apart from this, however, the work has great merit. In spite of the numerous details with which it is charged, it is extremely lucid, intelligible, and written in a simple and vigorous style, while the admirable maps by which it is illustrated enable the reader to follow with facility the intricate movements of the early part of the campaign.

The book is conveniently divided into two volumes, in accordance with a natural arrangement of the subject. The first volume treats of the origin of the war, and the series of events which led to the retreat of the Ashanti army across the Prah; the second of the march to Coomassie, and subjects relating to the condition and prospects of the countries of the Gold Coast.

The war originated in the old feud between the Fantis and the Ashantis. The Ashantis naturally felt a strong objection to the transfer of Elmina from the Dutch, the friends of their allies the natives of Elmina, to the English, the friends of their hereditary enemies the Fantis. Again, the King of Ashanti favoured the Dutch rule rather than the English, because the former encouraged the slave trade, while the latter had always striven to keep it down. This trade formed one of the chief sources of revenue to the Ashantis, who regularly sent down slaves to the Dutch possessions, where they were purchased and shipped under the name of soldiers to Java. Ashanti traders hardly ever ventured to visit Cape Coast after the war of 1863, and the Ashantis felt, no doubt, that if Elmina passed into the hands of the English, the allies of their enemies the Fantis, they would find themselves shut out altogether from the coast. Accordingly, in November 1870, while the negotiations between the English and Dutch governments for the cession of Elmina were in progress, King Koffee Kalcilli wrote to Mr. Ussher, the administrator of the Coast Settlements, protesting against the transfer, and claiming Elmina as his own, on the ground that it had paid tribute to his ancestors from time immemorial. This put a stop to the negotiations for a time. The English Government appears to have acted with judgment and caution. If the English settlements were to be retained, it was a wise and politic measure to bring the Dutch settlements intermingled with them under the same rule. As matters stood, broils were constantly arising between the tribes under the Dutch, and those under English protection. But the British Government refused to accept the transfer, which the Dutch were eager to make, until King Koffee's claim was withdrawn, and the consent of the King and chiefs of Elmina to the change publicly given. This having been effected, the forts were finally handed over on April 6, 1872.

In the meantime, negotiations had been going on for some time between successive governors of the Gold Coast and the King of Ashanti for the release of certain German missionaries, who had been taken prisoners by Adoo Buffo, an Ashanti chieftain, and kept in confinement at Coomassie. All appeared to be satisfactorily arranged except the amount of the ransom to be paid, and King Koffee declared himself reconciled to

the transfer of Elmina as a *fait accompli*, when on January 29, 1873, the news reached Cape Coast Castle that the Ashantis had crossed the Prah, and invaded the Protectorate. The negotiations for the release of the missionaries had been carried on merely to gain time to complete the preparations for war, which the King had long been making.

The Fanti tribes met the invaders near Dunquah, about eighteen miles from Cape Coast, at the beginning of April, and after successfully repelling for the first time in their history the attack of the Ashantis, they all at once unaccountably retreated, and broke up in utter confusion. A third encounter in the neighbourhood of Elmina resulted in the complete rout of the Fantis, and a terrible panic reigned at Cape Coast, the people of the surrounding districts flocking thither in thousands for protection. After this the Fantis could not be brought up to the fighting point again, and Colonel Harley, the Administrator, could merely hold the forts at Cape Coast and Elmina until the arrival of Colonel Festing with a reinforcement of marines in the month of June. Then the disaffected quarter of Elmina was bombarded, and the Ashanti forces who came to the rescue severely defeated by Colonel Festing's troops. The road to the Prah was commenced by Lieutenant Gordon, Houssas drilled, and advanced fortified posts established to cover Elmina and Cape Coast. But no active operations of importance were undertaken until after the arrival of Sir Garnet Wolseley on the 2nd of October. Captain Brackenbury complains that the General was sent out without an army—required to make bricks without straw—but the Home Government surely acted wisely in not sending out European troops until Sir Garnet Wolseley had personally examined the state of affairs, and estimated his requirements for the campaign. There was ample time for communication before the fine season set in, during which time only active operations could be safely carried on. The white troops could not have been encamped for any length of time without most serious risk to their health and efficiency. If they had been available for an attack upon the flank of the Ashanti army as it passed within striking distance in its retreat to the Prah, it is probable that severe loss might have been inflicted, and the conclusion of a peace materially hastened. But no result which did not include the occupation of Coomassie itself would have been satisfactory. The plan adopted was infinitely more advantageous in the end. The English regiments were kept in readiness at home, and despatched with extraordinary celerity as soon as the request for them was received. The invasion of the enemy's country could not be attempted until the military road to the Prah was completed, and this could not be accomplished until the Ashantis had recrossed that river. By pushing forward advanced posts and strongly fortifying them, by harassing the enemy by frequent reconnaissances and small attacks, the English commander, powerfully assisted by epidemic disease which raged in the enemy's camp, and the exhaustion of the supplies yielded by the country they occupied, succeeded in clearing the Protectorate of the invaders. Then the

road to the Prah was quickly completed, the white troops had arrived and were ready at hand, and the triumphant advance upon Coomassie was rapidly effected. The energy and ability with which the first series of operations was carried out have hardly been fully appreciated at home, for the difficulties were endless, and the labour entailed upon the staff and special service officers was enormous and unceasing. The full success of the expedition is largely due to the efficient service of the exceptionally able men whom the love of enterprise and Sir Garnet Wolseley's personal influence and reputation attracted to his side.

The story of the advance upon Coomassie has been told so often and so recently that it must still be fresh in the memory of every one, and it is not necessary to repeat it here.

The invasion of the Ashanti territory was ably and brilliantly conducted to a successful issue. The capital of Ashanti was for the first time entered by a victorious enemy. It is impossible not to feel regret that it was so quickly evacuated, for there seems now no doubt that the English army might have remained there a few days longer in perfect safety. Captain Sartorius rode through it with an escort of only twenty Houssas five days after Sir Garnet Wolseley left it. The day following Captain Glover entered it with his forces, and marched unmolested and without difficulty after the British army to Prahsu. Six days later still, carriers with mails for Captain Glover passed through the capital, and followed him safely down the road to the Prah. The difficulty of getting up supplies rather than the temporary flooding of the rivers was probably the chief cause of the hasty retreat. A meeting with Captain Glover in Coomassie, and the destruction of the Bantama, or sacred burial place of the kings, the sanctuary round which the horrible ceremonial of human sacrifices centres, would have added immensely to the value of the results attained. The King's executioner told Dr. Mackinnon that he killed two or three people every day, and at least a thousand a year, and that the week preceding the capture of the city the number of victims was so great he could not compute them. The Ashanti system of fetishism appears to be the only one in the coast district into which the element of human sacrifice largely enters, and it would have been an immense gain to the people of the country, and to humanity, if the despotism founded upon such a foul and bloody superstition had been utterly broken up and destroyed.

The Fanti tribes could not be induced to face the enemy, in spite of the "encouragement" given them by white officers, one of whom reported that the fatigue of beating the allies into action alone was excessive. But the disciplined native troops, especially the Houssas, Yorubas, and Kossoos, although given at times to a reckless expenditure of ammunition, appear to have developed good soldierly qualities. Rait's Houssa artillerymen fought as well as men could fight. It is clear that a trustworthy native force may be raised from these sources amply sufficient for the defence of the Protectorate.

The work of the Engineers in making the road to the Prah, bridging rivers, throwing up defences round the fortified posts and camps, and cutting paths for the advance in the enemy's country, hampered as they were by the difficulty of obtaining efficient labour, must have been extremely arduous, and it was thoroughly well done. Indeed the Engineers and the medical department have shone conspicuously in this campaign. We were told at the outset that it was an engineers' and doctors' war, and they have every reason to be proud of the part they took in it. No hitch of any kind appears to have occurred. The sanitary arrangements of the camps, and the precautions adopted for the prevention of sickness, were excellent; the hospital accommodation on the line of march, and the provision for the transport of the sick and wounded, were ample and efficient. The result is seen in one of the most striking features of this campaign, carried on in the most unhealthy country in the world, viz., a mortality of only sixty out of the whole force of 3,985, little more than fifteen per thousand, or considerably less than 2 per cent., including ten men killed in action. The mortality in the three white regiments was only 1 per cent.; in the Naval Brigade 2 per cent.

The men were no doubt picked men in the prime of life, and the amount of sickness was large, being as high as 71 per cent. in the English regiments; but the final result is in any case very extraordinary, and speaks volumes for the efficiency of the Army and Navy Medical Departments. The same success did not attend the Control. Captain Brackenbury admits that the transport was a failure. The only means available for conveying supplies into the interior were men and women carriers; and the duties of the Control officers were too multifarious, and they were too heavily overworked to organise them systematically, or superintend them efficiently. The result was that men of different tribes were jumbled together instead of being kept in separate gangs under their own headmen. Engineerlabourers were laid hold of for transport purposes; some carriers did double work, being started off with fresh loads the moment they arrived without perhaps getting any pay after all, while others got paid without carrying a load. Discontent arose and desertions became serious; the transport in fact broke down, and active measures had to be taken by the commander, who impressed disarmed native levies into the service, and placed the whole management in the hands of one responsible officer, Colonel Colley. It was understood that no four-footed animal fit for transport could live on the Gold Coast, and no attempt was made to employ them; and yet we read of Captain Sartorius riding a pony in his adventurous expedition to Coomassie. Sir Garnet Wolseley and some of his officers had mules, and a large herd of cattle were driven right up to the Ashanti capital, so that perhaps animal transport might have been used after all.

To the auxiliary expeditions designed to march converging columns of native allies upon Coomassie, Captain Brackenbury does full justice. Captain Butler and Captain Dalrymple failed to bring up the Akims, in

spite of most zealous and untiring efforts, through the incurable cowardice of the people. Captain Glover, however, succeeded in marching triumphantly into the Ashanti capital with nearly 5,000 men eight days after Sir Garnet Wolseley's occupation of it, to whom he rendered most important service by drawing large forces of the enemy from the main body. His wonderful power of carrying the native chiefs with him and making them fight, and his laborious march with the army he had created through a most difficult country, are well worthy of a separate record. With a little more time Captain Glover would have led a great and formidable army to the invasion of Ashanti.

The feeble character of the Fantis, and the impossibility of maintaining a strong European staff in such a climate, seem to the author to be almost insurmountable obstacles in the way of effecting any material improvement in the condition of the countries of the Gold Coast. The only hope he sees is in the development of the gold mines, and the introduction by that means of a large foreign element into the population. There seems to be no doubt of the existence of gold in abundance. The sands at Cape Coast are golden. Captain Thompson found the roads in the Wassaw country impassable at night by reason of the gold pits dug there. Captain Butler describes Western Akim as teeming with gold; while Captain Glover states that in Eastern Akim "gold is as plentiful as potatoes in Ireland." The opening of these mines would, no doubt, soon introduce an invigorating foreign element into the population. But this would also be a new element of trouble, and would, for a time at least, rather increase than diminish the difficulties and responsibilities of the Government. W. B. CHEADLE.

The History of the Parish of Kirkham, in the County of Lancaster. By Henry Fishwick, Esq., F.R.H.S. (Manchester: printed for the Chetham Society, 1874. 4to. pp. vii. 208, iii. 18.)

THE parish of Kirkham is not one well-known to fame. No great battle was ever fought in it, no great man was ever born in it, and yet its history, here printed in a handsome quarto, is a book which is far from being without interest. Probably a British fortress, certainly a Roman station, ("nearly the whole length of the long street of Kirkham" being on their road), it formed a portion of the large territory granted at the Conquest to Roger de Poitou. The Domesday Book shows that the place-names then in use have continued with little variation to the present time. The town of Kirkham was one of the first entitled to a market and fair by royal charter, which was granted 15 Edward I. It was a corporation of burgesses and bailiffs, with "gauldryers," "leather scarchards," "flesh and fish viewards," &c., duly empowered to fine bakers for not making good bread, and to order that neither "malt makers nor any as they employ, shall not dry any malt nor weete any dry barley upon the Sabbath day for the time to come in the pain of 20s."

The parish of Kirkham was governed by

"sworn men," a name given as early as the fourteenth century to persons entrusted by popular election with the charge of the parish affairs. There are several places in Lancashire which were formerly governed on this plan, but Kirkham stands alone in having thirty men. Their records contain some curious entries. In 1636 the vicar attempted to impose some conditions upon them, and upon their refusal to comply he kept them out of the church, a proceeding which led to a legal struggle, wherein the parson was ultimately worsted. One of Vicar Fleetwood's rejected conditions was: "if there be any turbulent, or *fascitious* person, that the rest of the company shall joyne with the Vicar and turne him oute." In 1680 a catalogue of recusants was drawn up to assist the justices of the peace in the collection of "Sunday shillings"—that is, fines for non-attendance at the parish church. In the parish of Osbaldeston, the poorer Roman Catholics who were unable to pay this sum for each attendance at the mass, are said to have been furnished with a red cloth collar, which formed a badge of exemption. In North Lancashire the Roman Catholics are still vulgarly called "Red Necks." There were other Nonconformists who at times got into trouble. Cuthbert Harrison, B.A., who had been curate of Singleton during the Commonwealth, excited the wrath of the vicar of Kirkham after the Restoration, by preaching and baptising in his own house. For this he was placed under ecclesiastical censure, and going to the church, the vicar, who had his sermon written in shorthand, was so startled by the appearance of the heretic, that he lost his place, and so "was silent for some time." After appealing vainly to the churchwardens and to a justice of the peace, the vicar took Harrison by the sleeve and desired him to go out. The two walked together to the door, where the dissenter, with a strong voice said, "It is time to go when the devil drives!" This feud culminated in a suit which the vicar brought against Mr. Harrison "for twenty shillings per month for six months absenting himself from church." The defence was that when he did go to church he was put out by the plaintiff.

The judge seems to have been of a facetious temper, and said:—

"There is fiddle to be hanged, and a fiddle not to be hanged. The defendant was under church censure which might prevent his going to church; but he goes to church and is put out, and then is sued upon the statute for not going to church. Gentlemen, pray consider it."

The vicar lost his cause and had the costs to pay.

An earlier curate of Singleton than Cuthbert Harrison had some grievous charges laid to his door in 1578. He neither preaches, visits the sick, nor teaches the catechism, and "he churcheth fornicatours without doinge any penance." A fellow feeling made him wondrous kind, for it is also affirmed that "he hath lately kepte a typlinge hous, and a nowty woman in it."

To a woman likewise connected with a tipling-house, Kirkham owes its present Free Grammar School. Isabel Birley, a benevolent alewife, in 1621 went to the sworn men who were assembled in the

church, and showing them 30*l.* which she had in her apron, told them she had "brought that money to give it towards the erecting of a free schole for pore children to be taught gratis." The apron of money received sundry additions, but none of the gentry were so open-handed in their liberality as kindly Isabel Birley. It is a pity after so good a beginning to find that the "religious difficulty" intruded itself, and that when the foundress, now by a second marriage Isabel Wilding, went to the scollies, in 1636,—

"her purpose being to have bestowed 30*l.* more towards the school if she had found them favourable to her in something she willed of them. . . . Whereas, Mr. Clifton gave her harsh words, and such as sent her home with much discontent and passion."

Another benefactor of the parish was James Thistleton, of Wrea, a tailor whose wages for the greater part of his life did not exceed fourpence a day and his victuals, and yet left enough of money at his death in 1693 to establish a free school.

Amongst the old houses of Kirkham, Mains Hall is noticeable as being traditionally connected with two very different notabilities. Allen, the last of the English Cardinals, is said to have had his hiding-place there, and "it is also reported that on more than one occasion the Prince Regent paid visits to Mrs. Fitzherbert, whilst she was staying there with her relatives."

Kirkham is not destitute of folk-lore. There was a witch at Singleton, and a hairy ghost at Weeton; a cucking stool existed here as early as the twelfth century; football was played in the streets on Christmas Day, bragget Sunday, teanloe night, and Mayday were duly observed. Bull-baiting, bear-baiting, and cock-fighting were amongst the old amusements, pace-egggers went about at Easter, and charms and omens of various descriptions were firmly believed in. Perhaps the funniest bit of superstition is that given from a tract printed in 1646, setting forth that a papist lady gave birth to a headless babe for having said, "I pray God that rather than I shall be a Roundhead or bear a Roundhead, I may bring forth a child without a head." This is graced with the attesting signature of Edward Fleetwood, pastor, and not improbably was printed by the authority of the House of Commons!

Colonel Fishwick has given us a good and trustworthy history of a little-known piece of Lancashire, and his work throws occasional lights on the history of local self-government, on nonconformity, folk-lore, and dialects, whilst that literary devourer, known as the general reader, will find in it also something to interest and amuse him.

WILLIAM E. A. AXON.

The Education of American Girls, considered in a Series of Essays. Edited by Anna C. Brackett. (New York: G. P. Putnam's Sons, 1874.)

THE discussion which originated with the publication of Dr. E. H. Clarke's book on Sex on Education, and which has excited so much interest here, has naturally been still more rife in America. The present volume appears to have been called into existence

by that publication, and consists of a series of papers bearing in different ways on the higher education of women in the States. Some of these papers are devoted chiefly to statements of fact—to the description of the course of instruction, the number of pupils, and the general working of the system in those colleges and higher schools to which women have been admitted. Others concern themselves more with principles, and discuss the moral and mental culture of women generally, and the effect of intellectual action on physical health. And one contribution to the volume, a thoughtful essay by Miss Mary E. Beedy, on "Girls and Women in England and America," is likely to prove especially interesting to English readers, as the writer is evidently very familiar with the social life of both countries, and evinces much keen and discriminating insight in her analysis of national characteristics.

From the statistics of the American Bureau of Education, it is shown that there are forty-six colleges and high schools open to students of both sexes. In the University of Michigan, which is organised in three departments—that of literature, science, and arts; medicine and surgery; and the department of law—four women have graduated in the first, four in the second, and twenty-one in the third during the last four years, the whole number of female students regularly matriculated in the University being ninety-three. In Oberlin, which was from the first open to students of both sexes, no fewer than 620 women have graduated since the foundation, the number of men in the same period being 1,005. The Mount Holyoke Female Seminary was opened in 1837. It receives no pupils under sixteen, and admits none under eighteen to the senior class; and the number of graduates in thirty-six years has reached 1,455. Vassar College was founded expressly for women in 1865, and has 350 students. From all these and from other institutions statistics have been drawn, intended to show that the health of the girls compares very favourably with that of the young men in similar circumstances, and that the rate of mortality, so far as it can be estimated from enquiries into the subsequent career of the students, is somewhat lower in the case of the women than in that of the men. Of the male graduates of Antioch, for example, it is asserted that

"13½ per cent., while of the women graduates only 9½ per cent., have died. This calculation is exclusive of the war mortality and of accidental deaths. Of the female graduates it appears that three-fourths have since married, and four-fifths of these were two years ago mothers. Only one-half of the remaining fourth are graduates of longer standing than 1871."

All the writers concur in regarding Dr. Clarke's warning as to the enfeebled health of American women with grave concern. They differ from him, however, in ascribing it to other causes than the severity of the studies, or the intellectual stimulus afforded by higher education. Miss Brackett declares of American girls generally that their brains are not overworked, but that their bodies are underfed. "Their food is not sufficiently nutritious, and the energy of the digestive organs is wasted in working upon material which, if it does not irritate and inflame, is

at least of no economic value." Stimulating viands are preferred to nourishing food. "There is no country in the world equal to America in the irregular and spasmodic nature of the demands which society makes upon its women." "Bad air also is likely to be a more active cause of disease in America than elsewhere, for in no other country are furnaces and close fireplaces in such general use." And as to sunlight, "that invaluable medicine for all forms of nervous disease, Americans more than any other people curtain it out carefully for fear of causing carpets and furniture to fade." Artificial habits, premature social excitement, late hours, the absence of robust physical exercise, are the fruitful causes of ill-health, according to the unanimous testimony of these writers. At the same time it is urged, and with considerable force, that much of the lassitude and weakness of which complaint is made would rather be remedied than increased by well-directed intellectual activity.

"There is no surer way," says Mrs. Cheney, "to destroy the health than to care for nothing beside it; and the most important condition for the young girl approaching maturity is to have her thoughts turned from herself to wide and large interests, and to have both mind and body healthily and regularly occupied."

Languor and debility are as often attributable to the want of high purpose, of definite occupation, of adequate motive for intellectual effort as to any other causes.

On the subject of the peculiar physical conditions which dominate all the work and vitality of a girl, especially between the ages of fourteen and eighteen, the writers in this volume speak with less reticence than is usually observed in books not designed exclusively for the medical profession. Notably Mrs. Jacobi, who is herself a Doctor of Medicine, replies to the physiological arguments of Dr. Clarke in considerable detail, and with much candour and ability. It will suffice here to indicate the general scope and bearing of her reasonings. It is not stimulation of the intellect, she contends, but excitement of the feelings, that can be shown from physiological data to have an injurious and disturbing effect on certain nerves, and so to interfere with healthy functional activity. Instead, therefore, of Dr. Clarke's suggestion to provide regular intermittences in the education of girls, "conceding to nature her moderate but inexorable demand for rest during one week out of four," she would substitute a more complex method, which she thus describes:—

"Secure the predominance of the cerebro-spinal system over the activity of the ganglionic. Since the activity of the cerebro-spinal system may be roughly divided into a twofold direction, intellectual and muscular, this predominance is to be secured by assiduous cultivation of the intellect as compared with the emotions, and of the muscles of the limbs as compared with the muscular fibre of the blood-vessels. In other words, the evil effects of the emotional excitement natural to adolescence are to be combated by a larger, wider, slower, and more complete intellectual education than at present falls to the lot of either boys or girls; and the dangers incident to the development of new activity in the ganglionic nervous system—the dangers of irregular circulation, vaso-motor spasm, and paralysis—are to be arrested by systematic physical exercise that shall stimulate the spinal nerves, quicken the external circulation,

and favour the development of muscles at the moment at which their activity threatens to be overpowered."

And from such reasons it is inferred that, while special supervision and watchfulness are undoubtedly needed in a higher degree in the education of girls than in that of boys, that supervision does not necessitate, except in rare cases, periodical interruption of study:—

"It does necessitate, however, the more difficult task of providing for adequate rest and exercise during every day of the month. It necessitates a more rational system of study, a more profound training, a more intelligent view of the real character of intellectual life and of the conditions necessary to develop it. It necessitates a concentration of intellectual effort into four or six hours out of the twenty-four, instead of a useless diffusion of intellectual peddling over ten or twelve. It necessitates an extension of the term of years allowed for education, and the giving up of the fashionable notion that a girl is to be 'finished' at seventeen or eighteen, while her brother continues to pursue his studies until twenty-two or twenty-five. It necessitates, finally, the most careful individual adjustment to each different case, and to all its peculiarities, mental, moral, and physical—quite as frequently, therefore, necessitates the education of girls apart from one another as apart from boys."

Yet, in spite of the strong bias of the writers, the evidence given in this volume in favour of mixed education, or the joint instruction of both sexes during the period of college life, is far from being strong or conclusive. It is true that it is repeatedly urged with some force that in the Western States, where the population is comparatively sparse, and the teaching resources need to be economised, academic instruction must either be obtained in mixed classes, or denied to women altogether. But the testimony which English parents would like to receive from professors and parents in America as to the actual working of the conjoint system, the influence of competition at examinations, and the moral effect of the association at lecture or in class, is entirely absent from this book.

On the other hand, there is nothing in the volume which throws any light on the vexed question as to the subjects of study intellectually appropriate for men and for women respectively. Much has been said in America and in England on sex in mind and education; but it would seem that in neither country has any successful attempt been yet made to differentiate the courses of study, or to determine what part of a liberal education is especially masculine, and what part is feminine. There is a vague impression current in this country, that for some inscrutable reason Greek, Latin, and mathematics furnish the best intellectual discipline for young men, and that French, Italian, and the belles lettres are most appropriate for their sisters. This impression prevails to a far less extent in America, but it derives no real support from the experience of that country or our own. There is no reason to believe that any worthy subject of enquiry, or any ennobling mental discipline, is unsuited to the intellectual life of a woman. Whatever interest women have taken in learning, and whatever distinctions they have acquired, have been found in the old recognised paths of liberal education—in

language, in science, in literature, in philosophy—and not in any one of those departments of thought which our *à priori* judgments might lead us to regard as distinctively feminine. The truth is that learning and intellectual culture, so far, at least, as they can be pursued in early life, are of no sex. Striking and beautiful diversities will probably manifest themselves under the teaching of Nature, in the applications of such learning and culture to the mature work of life. But hitherto all our attempts to map out the field of human enquiry and intellectual effort, and to assign from the beginning the portions of it which should be cultivated by boys and girls respectively, have proved a complete failure. And the practical conclusion is that it is wise, once for all, to abandon such attempts; to offer both to men and women the best course of instruction we can devise; to choose our subjects rather in view of their disciplinary value as noble and elevating intellectual exercises, than with regard to their supposed bearing on this or that part of professional or domestic life; and then to await the result. Fuller experience may possibly prove to us that some lines of investigation are more likely to prove fruitful and helpful to women than others. But at present the data for such a choice are not before us; and we cannot either safely or wisely pre-judge the question.

There is no sadder subject of reflection than the amount of unused capacity and wasted force in the world. "Here and there," says George Eliot, "is born a Saint Theresa, foundress of nothing, whose living heart-beats and sobs after an unattained goodness, tremble off and are dispersed among hindrances, instead of centreing in some long-recognisable deed." Much more often may we see women leading aimless and sterile lives, who nevertheless possess great capacity both for acquiring and for imparting knowledge; and gifts which if properly cultivated might have enriched the world, and added to the happiness of all those with whom they are associated. Even on the low ground of economic expediency, therefore, there is much to be said in favour of placing within the reach of women greater facilities for advanced and varied education, and of inviting such of them as possess the will and the ability, to avail themselves, under proper conditions, of the recognised encouragements and tests furnished by the Universities. The evidence which comes from America reminds us of the imperative necessity for increased precautions in regard to the care of health, and for physical training *pari passu* with greater intellectual stimulus. It is calculated also to suggest some grave misgivings as to the project of mixed education, and as to the heedless application of so much of our present academic system as is associated with the competition and struggle for prizes. But it is full of encouragement to all those in this country who are seeking to enlarge the range of intellectual pursuits accessible to women, or to offer to them greater facilities for acquiring a sound and generous education, and for obtaining honourable employment.

J. G. FITCH.

Autobiographical Recollections of the Medical Profession. By J. F. Clarke, M.R.C.S., for many years on the Editorial Staff of the *Lancet*. (London: Churchill, 1874. Pp. 537.)

THIS is a most interesting, agreeably written, and instructive book. It consists of a series of papers that have from time to time appeared in the pages of the *Medical Times and Gazette*. The important position which Mr. Clarke long held on the staff of the *Lancet* frequently brought him into intimate relation with the principal medical men of the last forty years; and his excellent knowledge of human nature, his intelligence and retentive memory have enabled him to reproduce in an easy gossiping style many traits of character of distinguished men that it would have been a subject of great regret to have lost. Mr. Clarke commences by giving an interesting sketch of the condition of the medical profession in 1823, showing how little hospital surgeons and physicians entered at that time into the work of teaching, which is now considered so important a part of their duties, and which is in general so well discharged. Then comes an account of the origin of the *Lancet*, which from the first was popular with the alumni and surgeons in general practice, but was dreaded, feared, and disliked by consulting practitioners, lecturers, and hospital medical officers. For a short time, says Mr. Clarke, the name of the editor was a secret, but it could not long remain so. Young Wakley was seen to take notes, and Sir Astley Cooper took a characteristic method of settling the point. "He went late to Mr. Wakley's house in Norfolk Street, rung the night-bell, requested to see the 'Doctor' immediately respecting an urgent case, was ushered into Mr. Wakley's private room, and there found the culprit actually correcting a 'galley' containing a report of his (Sir Astley Cooper's) lecture delivered the night before." The unexpected meeting and the discovery gave rise to a hearty laugh on both sides.

Mr. Clarke, referring to his own origin, gives an anecdote of Cowper which he says is certainly genuine:—

"The chief hairdresser of the town, Mr. Wilson, whom I well remember when he had become an old man as the clerk of the 'meeting' house, was in the habit of shaving Cowper. The poet used to sit in a semi-reclined position, his head thrown back and his eyes shut. Seldom or never did a word pass between them. On one occasion, however, the silence was broken by the following circumstance:—Wilson was shaving away in solemn silence. The poet was that day to dine with Lady Austen at Clifton. Wilson had left home to be punctual to his engagement, and had desired his journeyman to bring Mr. Cowper's best wig after him—the wig having been dressed for the occasion. When Wilson had finished the operation, Cowper suddenly exclaimed, 'Oh, Mr. Wilson, my wig!' Wilson, who was a wit—and many were the witticisms that I heard from him in after years—immediately said:—

'I came before your wig was done,
But if I well forbo'le,
It certainly will soon be here,
It is upon the road.'

The poet gave one of his melancholy smiles, and said, 'Very well applied, indeed, Mr. Wilson.'

Mr. Clarke was concerned, as representative of the divisional surgeon of police, with

the examination of the organ boy murdered by Burke and Hare, and states that he well recollects most of the incidents of the affair. The internal organs were carefully examined; there was no trace of injury or poison.

"Mr. Mayo, who was the Lecturer on Anatomy at King's College, and had a peculiar way of standing very upright with his hands in his breeches pockets, said, with a kind of lisp he had, 'By Jove, the boy died a natural death.' Mr. Partridge and Mr. Beaman, however, suggested that the spine had not been examined; and after a short consultation it was determined to examine the spinal column. Upon this being done, one or more of the upper cervical vertebrae were found to be fractured. 'By Jove,' said Mr. Mayo, 'this boy was murdered.'"

It afterwards transpired that it was the custom of the murderers to strike their victim upon the upper part of the spine, and when insensible to place him head foremost in a water-butt.

The following is also a very amusing story, though we may hope for the credit of the profession that the "preliminary" now required would prevent its recurrence. Speaking of the Westminster Medical Society, Mr. Clarke remarks that it is seldom that one has to record anything comical in the history of a learned society. One instance, however, he calls to mind. Amongst the fellows was a gentleman who had long practised in Sussex and came late to London life. He was a big pompous man, always spoke with an oracular decision, and placed the fingers of his right hand in his waistcoat. The subject of discussion was cholera. The oracle rose and said he had made the discovery that cholera was known to Shakespeare. This statement immediately arrested the attention of the meeting. "Yes, I was at the theatre last night and I saw the play of *Taming of the Shrew*. Petruchio says to Katherine 'You are choleric.' A burst of laughter followed this announcement, but the speaker gravely asserted that to convince himself the actor had made no mistake in the word he had referred to the works of Shakespeare and found that the word had been rendered correctly! The *savant* doctor never could be convinced that he had found a mare's nest, but prided himself on his discovery ever after.

It will be seen from these examples that Mr. Clarke knows very well how to tell a story, and we wish we could follow him in his innumerable recollections of well-known names out of the profession, as Kean, Keeley, Westmacott, Maguire, Lyndhurst, Irving and others, but we may remark that there is a most interesting account of Elliotson and his relations to mesmerism, which, though undertaken in good faith, led to his resigning his appointments at University College Hospital. The work closes with a series of biographical sketches more or less anecdotal of various distinguished surgeons. Altogether, though written in a somewhat discursive style, Mr. Clarke's recollections form a work which once taken up it is difficult again to lay down, and we cordially recommend it to our readers. H. POWER.

THE celebrated Talmudist Rabbi Enoch Kirsch died last week in Jungbunzlau (Austria), aged 105.

An Historical Atlas of Ancient Geography, Biblical and Classical. Compiled under the superintendence of Dr. W. Smith and Mr. Grove. Parts III. and IV. (London: John Murray, 1874.)

WHEN we compare such a work as this with the Hereford *Mappa Mundi*, we can readily measure the difference between our geographical knowledge and that of the Middle Ages, and still more between our modes of thought and those of our ancestors. It may be true that no exact date marks off the Middle Ages from modern times on the one side, or from the classical age on the other; but the enormous differences of social life and of culture are what really constitute the difference which is quite rightly drawn in the common chronology between the three periods of history. The mediæval geography rests on a mixed selection from Jewish and Roman sources. Josephus perhaps began the confusion when he wrote a sort of Bible made easy for the Greeks; in it he combines the rivers of Paradise with the Ocean stream of Homer and Herodotus which runs all round the world. Jerusalem now becomes the centre of the world, and in the off regions, "the uttermost parts of the earth," the strange animals and products which Pliny enumerates from Herodotus and other Greek authorities, are pictorially represented. The discovery of what is rightly called the New World broke up this old system, and destroyed the authority of the previous geographers. Henceforth maps have to be constructed more and more from actual voyages, travels, and surveys, while improvements in astronomy and in the construction of time-pieces ensure corresponding advances in geography. Herodotus describes places vaguely by the number of days' sail or march; an inland place is mentioned as "opposite" some place on the coast: the mistakes, even of direction, possible under such a system are manifest when we find Strabo making the Pyrenees run north and south, and putting Ireland to the north of Britain. One of the maps in Part IV. of the present Atlas contains "The Geographical Systems of the Ancients," and their errors of direction are excellently shown, except that the Pyrenees are not given. It is curious to see how several maps make Africa bend round to India, so as to make the Indian Ocean nearly or wholly an inland sea. In the map according to Herodotus, perhaps his theory of the "symmetry" of the three parts of the world is hardly brought out quite fully. He thought that each had a great river first running east and west, then turning sharply in the other direction. The Danube, Nile, and Araxes correspond, and the mouth of the Nile is just opposite the mouth of the Danube. His position for the Celts, just to the north of Portugal, is clearly shown: he had no idea that they stretched right across Europe nearly to the head of the Adriatic, and would soon be invading Greece herself as well as Italy. In fact, he must be copying the account of some Phœnician coasting voyage, the same probably as that from which he borrowed his description of the tin and amber regions.

Part III. contains six maps. The first depicts the southern part of the Holy Land,

of which the physical configuration is very clearly marked; for instance, where the road leads from the coast up the valley of Aijalon to Jerusalem. The type in which the names are printed is clear, but some of it is almost too small where the shading of the hill districts comes across it. The latest measurements of the Dead Sea district have, of course, been used; but in looking down the map, and passing from "Hazezon Tamar" to "Point Costigan" and "Point Molyneux," we cannot but wish that the meritorious American voyagers had refrained from leaving their names about in such a random manner. We observe that Lechi and En-Hakkore, the scenes of Samson's exploit, are placed at Tell-el-Lekiyeh, just north of Beersheba, and at the large spring north of the Tell, as Van de Velde puts them, though Mr. Grove has rather argued against this view in the *Dictionary of the Bible*. The next map gives Palestine as part of the larger Asiatic whole which influenced its history, showing its connexion with Egypt, Arabia Deserta, Mesopotamia, and Syria, with Armenia and part of Asia Minor. The hill outline is here more distinct than in the previous map, being more boldly drawn, and the colouring of the desert and of the green cultivated land very pleasing to the eye. The meeting of the desert roads at Palmyra is conspicuous; the map explains the history, as maps should do. Of the Herodotean names, Ampe on the Tigris is given conjecturally, but not Arderikka, though Herodotus mentions its distance from Ampe and from Susa. On some of the Greek names used for Susiana and its districts there is a good article by Nöldeke in a late number of the *Götting'sche Gelehrte Anzeigen*. Next comes a map of Northern Greece, with the growth of the Macedonian kingdom at three stages marked, before and after the Persian war, and in the time of Philip II. There are more ancient and fewer modern names than in the map of Palestine, and as the former are in thicker type, the eye has easier work. A map of a modern country with railways and a fringe of telegraphs marked in every direction is very confusing. An ancient map always looks clearer. The range of Scardus is, of course, given as running north and south, whereas in the old maps Strabo's authority had caused a line of mountains to be drawn in a straight line from the Adriatic to the Black Sea, in continuation of the main chain of the Alps. Such attempts at giving greater symmetry to nature, than she possesses, come under Bacon's well-known rule. We notice that Lychnidus is placed at the north, not at the south extremity of Lake Lychnitis, and that Dodona is definitely fixed on the south side of Lake Pamotis. An attempt is being made in the new Berlin *Zeitschrift für Numismatik* to fix some of the northern names approximately to the spots where coins of them are found. The word *Θρακη* across the sea between Athos and Thasos has a singular look, and the *r* and *k* are wrongly shaped. The mass of the northern land as compared with Hellas proper is very striking, and we see why Herodotus and Thucydides feel that "if the northern people were united, they would be irresistible." The next map gives Central Greece on a larger scale, which is

essential for Athens and Attica: for instance, the inland and coast roads from Marathon to Athens, so famous in the history, are beautifully marked. Athens itself, and the Acropolis, and the district immediately round Athens, and Eleusis, and Marathon have separate small maps to themselves. The Ilissus is made to run outside the walls of Athens, according to the old view. We wish it had been possible to give a map of the Athenian Confederacy. The map of Spain which follows may be compared profitably with that given in the Berlin volume of Latin Inscriptions relating to Spain. The remarkable number of forged inscriptions has caused several towns to be wrongly placed on the maps. Fortunately the Spaniards, whose local patriotism caused them to commit the forgeries, were not well acquainted with the Latin of the Roman times, and their handiwork is detected with comparative ease. In the map of "the World as known to the Ancients," a full and correct outline is drawn even of South Africa and South Asia; it was sufficient to give the ancient view of Africa in the special maps already mentioned. The name Thule is assigned to the Shetlands as well as to Iceland, though with a query. The remaining map in Part III. contains four maps of Asia Minor—in Persian times, after the battle of Magnesia, under Mithridates, and after Diocletian. In that under Mithridates, the extent of Tigranes' Armenian kingdom is well given, and we see at a glance the importance of his alliance.

Part IV. begins with a splendid map of Sinai and the Desert of the Wanderings, taken from the Ordnance Survey. The discussions on the many doubtful points are easily intelligible with such a plan of the country before us. There are separate maps of the two mountains Sinai and Serbal. Then comes a large map of Asia Minor to supplement the four historical outlines given in Part III.: it is of much use for the period of the Crusades as well. In fact, the routes through Asia Minor must lie through certain passes, and cross the rivers at certain places, and nothing is more remarkable than the uniformity of the course, in either direction, taken by invading armies. A map of Northern Africa, in two parts, gives the Carthaginian and Roman settlements in great detail, and is also useful for the period of Mahometan conquest, and even down to the time of Charles V. The present French plan of opening the old inlet of the Syrtis, and driving a salt-water lake a long way into the country, assumes a great appearance from the ancient outline on the map. Part of Egypt is given, and the route westwards along the oases from Ammonium to Augila traced. Two maps are devoted to the kingdoms of the successors of Alexander the Great, with two smaller sketches and a "Parthian Empire," so that in reality five historical periods are illustrated. Then comes "The Roman Empire in its Greatest Extent," and "The Empire after its Division into the East and West." It is curious to see how many of the old Roman boundaries remain in our present historical geography. The boundary between Italy and France was not altered

until Louis Napoleon took Nice, and the dividing line between Piedmont and Austrian Lombardy was until lately the same as that between the Ligurians and the Cisalpine Gauls. From the large "Map of the World, as known to the Ancients," we see at once how small a fringe round the Mediterranean the Roman Empire really occupied, and why the Romans were always looking anxiously up to the great northern regions, whence warlike tribes were constantly pushing down south and west, and from which they were always hearing faint, and as yet distant, sounds of the coming migration of nations. We see also how small a part of the world had been really converted to Christianity in the time of Constantine, and the importance of the great missionary enterprises of the English race at a later time to Germany and the North. The last map is one of Egypt and of Ethiopia above Egypt, so as to include Abyssinia: the narrow strip, thick with names, along the river-side, shows us how truly "the Nile is Egypt."

We have considered the Atlas throughout mainly from an historical point of view, looking on Geography as the basis of History, and have found the maps thoroughly satisfactory wherever we have tested them. The copious separate index to each map makes the work of consultation easy, and certainly no such help has been available hitherto to the English student. It would remain to examine the maps from a physical point of view, as to the representation of the hill countries and the watersheds; but this opens such an additional field of enquiry that we must content ourselves with alluding to it. The maps are an almost indispensable addition to the *Dictionary of Ancient Geography* and *Dictionary of the Bible*. Our only doubt is whether the maps will not one day make it necessary to have new editions of the Dictionaries. C. W. BOASE.

Historical Sketches. Vol. III. *The Idea of an University, &c.* By J. H. Newman, D.D. (London: Pickering, 1873.)

DR. NEWMAN is one of the most serious of writers, but it is undeniable that his writings often give us the sense of high comedy, and it is comedy of a very curious kind, because we laugh without laughing either at him or with him: he is grave, and means us to be; and though we cannot be grave, yet we do not find him in the least ridiculous. What amuses us is the delicate and pungent illustration of the ineradicable irony of things presented to us by the spectacle of a naturally keen and daring intellect, which is not exactly in bondage to a scrupulous conscience, but has become more subtle by being trained to keep step with it. Perhaps it is hardly right when so eminent an author is obviously writing in rational obedience to the highest motives to have a clear perception that he is dancing a hornpipe among eggs; but our compunction, if we feel any, only gives piquancy to our enjoyment.

In the present volume of his *Historical Sketches*, which upon second thoughts is to be numbered second, though issued third,

Dr. Newman gives us even more opportunities than usual for admiring the masterly grace of the performance, and being amused at its prescribed conditions. Perhaps the palmary instance is the treatment of the question whether Cyril can have been a saint, in the essay on Theodoret, which is the only unpublished paper in the volume. After quoting precedents from the Breviary—which of course cannot be suspected of being influenced by the “perennial fidget about giving scandal” which the author finds is endemic among contemporary Catholics—to prove that it recognises the idea of a sanctity, heroic but not faultless, and enables us to discriminate between the person and certain acts of a saint, the author has a right to infer that though St. Cyril dragooned a council, bribed an empress, and perhaps allowed Peter the Reader to suppose that he would think it served Hypatia right, he may have had heroic virtues all the time, and this of course implies that he must have repented of such serious imperfections. The proof of his repentance is found in the facts that for the last thirteen years of his life he hardly bullied anybody, and that for the last six he was never heard of. The description of the Council of Ephesus is also singularly good: we extract a passage, which must surely have been written after the Council of the Vatican—“Cyril had on his side the Pope, the monks, the faithful everywhere, Tradition, and the Truth; and he had not much tenderness for the scruples of literary men, for the rights of Councils, or for episcopal minorities.”

The author thinks Theodoret would have been happier and better if he had remained a priest, and so escaped his share of the episcopal squabbles of the time; and he gives a very graphic picture of Cyrrhesticea, the scene of his diocesan labours. It seems to have been as populous and as wretched as Lower Bengal, and to have been gradually depopulated by frontier hostilities: one asks oneself what the inhabitants had to lose by being carried into slavery.

The paper on Theodoret, and that on the exile of St. Chrysostom, which has appeared already in the *Rambler*, are fragments of a once intended volume which was to have included like sketches of St. Ambrose, St. Jerome, perhaps St. Athanasius. The introduction happily was executed before the scheme was reluctantly given up. It is a splendid specimen of Dr. Newman's peculiar combination of subtlety with solidity and breadth, and overflows with half-suppressed humour at the expense of the very curious specimens of hagiography which “chop a saint up into chapters of faith, hope, charity, and the cardinal virtues,” “which are rightly called spiritual reading”—and “cannot possibly be anything better.” Perhaps it is an unfortunate adherence to system, a fault we should hardly have expected in Dr. Newman, to begin a sketch of St. Chrysostom's personal character at the age of nearly sixty, because that is the date at which his correspondence begins, though it is not impossible that the author may have thought it not an inconvenience in his principle that it spared him the necessity of appreciating the Saint's judgment in the conduct of the quarrel which terminated in his exile. What attracts Dr.

Newman so strongly to St. Chrysostom is the latter's unflinching cheerfulness and ready sympathetic good nature; of his eloquence he says little, and that little shows plainly that it does not attract him. This is perhaps a misfortune, for it leads the author, both in this paper and in the earlier one on St. Basil and St. Gregory, to pass dryshod over a very interesting subject which no one could treat like himself—the relation of the Catholic clergy of the fourth century to the literary culture of their time. It would be an exaggeration to say that Basil, and Gregory, and Chrysostom were sophists of the fourth century who happened to be ardent Christians, just as Faraday was a philosopher of the nineteenth century, who happened to be a devout Sandemanian, because the religious belief of those Fathers did determine the historical activity of their lives, while Faraday's belief, though equally sincere, did not. Yet this paradoxical illustration does not bring out clearly enough that the large store of *axiomata media* which made up the ordinary furniture of their minds was pagan, while the corresponding furniture of the minds even of modern unbelievers is originally Christian.

Saint Jerome always turned his personal disputes into religious controversies: there is nothing polemical, though there was sometimes a good deal of bitterness, in the misunderstanding between St. Basil and St. Gregory. The course of this misunderstanding is traced, it need not be said, with infinite delicacy and reverence: perhaps it is this reverence which makes the author fail to see that the attachment was one-sided from the first. St. Gregory fell in love with St. Basil, who encouraged him for a time, and afterwards dropped him when he found he would not submit to be made useful in St. Basil's way. One is tempted to think that a good deal of the irritation on both sides was due to the fact that the saints had ruined their health by austerities. This is a point that perhaps deserves more notice than it has yet received. No austerities seem to have been too severe for the pure Copts and Syrians; but when the saints of Hellenised and Latinised races tried to emulate them, their constitutions gave way under the strain. It is worth notice that St. Augustin—who with all his emotional intensity was eminently reasonable and moderate both in practical and speculative matters, and contrived to keep himself in admirable working order in spite of a delicate constitution till long over seventy—dieted himself upon strictly sanitary principles, and almost always had a bit of bacon in the house. The two papers on St. Augustin, treating of his conversion and his action during the Vandal invasion, are among the slightest in the volume, and that on the conversion is written too exclusively from the wonderful “Confessions.” When we turn to what St. Augustin wrote at the time, we are led to think that though it would be almost blasphemy to call the Confessions unreal, the author felt the full solemnity of the crisis with far more habitual intensity in looking back upon it than in passing through it. Nothing on the other hand can be fresher or quainter than the paper on St. Martin: its only drawback is that it seems a waste of ingenuity to try to

form an estimate at once reasonable and pious of a saint whose own piety so completely superseded the necessity for reason. St. Martin acted upon obscure impressions, not upon intelligible motives, both in the matter of Maximus and in the matter of Idacius; if we think him a saint, it is simplest to accept his own estimate of his conduct without trying to understand it. Saint Antony, on the contrary, was thoroughly sober and rational, and in fact exalted “discretion” as the most precious possession of a monk. Dr. Newman's statement of the questions which his life suggests to Protestants is very ingenious and masterly; the main theory is that the liberality and wisdom of primitive Catholicism saved St. Antony (who is admitted for the sake of argument to have been an “enthusiast”) from being a Methodist or something yet more dreadful. His conflicts with the Devil are made sufficiently plausible by *à priori* considerations of what is reasonable and pious, and the admission of his biographers that his prayers had not always the power to heal is utilised as a proof of the sobriety and discrimination of the narrators of so many wonders.

It would have been premature in a work published for the first time in 1836 to discuss Saint Antony's place in the history of asceticism, though the discussion would have been very much in place at the opening of the essay on St. Benedict and his order, where the writer is led to oppose M. Guizot's view, that Eastern monasticism implied intellectual mortification, while Western monasticism did not. The matter needs fuller discussion than can be given here, but the facts of the case seem to have been somewhat as follows. Asceticism at starting was simply Christian Philosophy, and Philosophy was for a long time its common and appropriate name. It was supposed, by no means without plausibility, that the mind would be better able to attach itself to the transcendental ideas of Christianity so as to realise them habitually and to trace their connexion and their consequences, if the senses and desires were controlled with the utmost possible severity. It cannot be said that there was any preference originally for the intuitive side of this process as compared with the discursive; in fact, the example of Origen, the classical ascetic of his period, looks the other way. But the ascetic discipline strengthened the power of contemplation so much more than it strengthened the power of reasoning, that it must have tended in a period when general culture was in a state of progressive atrophy to develop the former at the expense of the latter. This tendency was very much reinforced by two causes—the immense authority of Saint Antony, who was deliberately illiterate, and the questionable reputation of Origen, whose voluminous writings were the natural field upon which speculative ascetics would throw themselves. Moreover the feeling, partly of alarm and partly of disappointment, which took hold of serious people when the profession of Christianity became general, without producing what could be recognised as a commensurate moral and social improvement, weakened the impulse even to contemplation, and produced a temper to which asceticism was valuable rather as a safeguard against

sin, or an expression of sorrow * for it, than as an imitation of the angelic life. And the example of St. Antony told in another way also; by selecting the desert as the normal theatre of asceticism he multiplied its difficulties up to a point at which the conquest of those difficulties became something to be sought in itself as a part of the service of God, instead of remaining a means towards obtaining a deeper and clearer apprehension of Christian truth. Still this cause of modification did not make itself felt for a long time. In the days of Saint Athanasius the hermits continued to represent the contemplative or, as it was then called, the "philosophical" tendency, while the Cenobites insisted rather on the ethical conditions of perfection; while the failures of self-control, which were more perceptible in the absence of outward distraction, became the source of constant self-reproach. Under all these influences, which were brought to a crisis by the violent collision between Theophilus and the Origenists, into which St. Jerome threw himself with such decisive vehemence, the well-known aphorism of the latter, "*Monachus non docentis sed plangentis habet officium*," became generally applicable, though it must have struck the readers not only of the *Historia Lausiaca*, but those of the *Theophilus*, as a questionable as well as an unwelcome novelty. It was no doubt this penitential type of monasticism which Saint Benedict finally established in the West, but even then we must not exaggerate the extent to which mortification of the intellect was carried. The renunciation of secular studies, on which Father Newman lays so much stress, would be a very severe mortification to a person with the literary tastes of St. Jerome; but in general it would be little felt while the Old and New Testaments were still unexplored and unfamiliar, and it is impossible to read St. Augustine's *De Doctrina Christiana* attentively without seeing that the clergy then were much more at a loss how to set about explaining the Bible than Sanskritists now are how to set about explaining the Veda. It is to be added that the penitential side of the idea of monasticism tended naturally to become less conspicuous when monasteries came to be recruited mainly from the pupils in monastic schools. Consequently the position of monastic teachers like Alcuin and Lanfranc was really much more natural and less exceptional than the author is forced by his theory to conceive it. The reason why the Benedictine order took no part in the scholastic movement is perhaps less transcendental than the author supposes. It was not merely that the spirit of the rule was incompatible with dialectic; so long as dialectic was in the main conceived as a science which a single teacher could expound to his disciples, the Benedictines could take their share in that as well as in other results of the gradual awakening of mental activity. But when dialectic and dialectical theology came to the matter of oral controversy (if printing had existed, it might have been different) among large numbers of competing teachers, an order whose principal

establishment existed already away from the centres at which the process of discussion was most active naturally fell out of the race.

Although the essays on the mission of Saint Benedict and the Benedictine schools seem to me, perhaps wrongly, to be coloured throughout by a conception that is hardly beyond question, it is a very great gain indeed to have them disinterred from the *Atlantis*, for Father Newman has written nothing more graceful or more penetrating than his description of the homely idylls of Benedictine piety, with its unreflecting yet fruitful activity. The papers formed the commencement of an intended series on the three great teaching orders, the Benedictines, the Dominicans, and the Jesuits, of whom the first are made the representatives of poetry (there is an admirable page on the essence of poetry in general and on the poetry of country life in particular), the second of science, the third of practical prudence. It would have been interesting to see, if the scheme had been completed, how the author would have accounted for the facts that the conscious poetry of religious life comes with St. Bernard and St. Gertrude at the very end of the Benedictine period, and even then finds a less luxuriant expression than in St. Francis and his order, and that the Jesuits have uniformly been the protectors of mysticism, while the Dominicans settled down after Tauler's time into something like systematic repression.

The discourses on University Teaching and the Essays and Lectures on University Subjects, now re-issued under the title *Idea of an University*, are much better known than most of the Historical Sketches; and perhaps, as they are less fragmentary, it may be said that their permanent value is greater, though it is hardly possible that their intellectual quality should be higher. Their republication has the merit of *à-propos*. Now that the question of reorganising the universities in the interests of independent research or useful learning, or both combined, is occupying public attention, it is well that we should be arrested, not by an elaborate *plaidoyer* in favour of the attainments we shall have to supersede, but by an authoritative statement of the ideal which we shall have to abandon. Dr. Newman's ideal of a university is simply a place of liberal education, of comprehensive mental discipline, where the mind is exercised in a few studies to apprehend the relations of all, and the teachers are too busy with their pupils to have leisure to make discoveries. No one can read the discourses without a conviction that the ideal is a very high one indeed, though it is hardly suitable to a period in which both knowledge and society are in rapid movement. As "Mr. Brown, sen.," says in Father Newman's own immortal apologue, "at this day nothing is so much wanted in education as *general* knowledge. This alone will fit a youth for the world. In a less stirring time it may be well enough to delay in particularities, and trifle over minutiae; but the world will not stand still for us, and unless we are up to its requisitions we shall find ourselves thrown out of the contest. A man must have *something in him now to make his way . . . the substance of knowledge is far more valuable than its technicalities*; the vigour of the

youthful mind is but *wasted on barren learning*, and its ardour is *quenched in dry disquisition*." To see issues truly, to weigh evidence scrupulously, to be always equitable and thorough and comprehensive, are qualities that have a permanent aesthetic value like the knightly grace of a Bayard. There have been times when they led naturally to usefulness and success, as there have been times when an accomplished tilter was likely to be a valuable soldier. At present they are their own reward, and have no practical value (egoistic or altruistic) compared with the faculty of assimilating and reinforcing, as largely as possible, the prevailing torrent of such confused ideas as seem unlikely to be contradicted by the most obtrusive facts of the day. Criticism of such ideas is as useless as a razor in a snowstorm; knowledge might keep them out—perhaps.

The essay on "A Form of Infidelity of the Day" is interesting, because of the curious likeness and unlikeness of the movement described in 1854 to the present development of Positivism, all the more because the author seems to have written in ignorance of Comte's existence. Still stranger is the discourse on "Knowledge in relation to Religious Duty," which contains, or seems to contain, the astonishing admission that virtue, as taught in Shaftesbury's *Characteristics*, might be maintained or diffused without limit on Shaftesbury's terms. This, like much else of Father Newman's work, suggests a suspicion that he finds the ultimate verification of his creed, not in its being the most plausible explanation of the facts of the universe or of Christian history, or in its truth being a necessary condition of human happiness and virtue, but simply in its being the correlative to his own very singular spiritual individuality.

The relations between faith and science are repeatedly discussed, and of course in a manner to claim and reward attention. At the same time one is tempted to feel that the author approaches the subject so cautiously and from such a distance that he hardly comes up to it. He insists largely upon two points of view which are unconnected, if not incompatible: the first is, that every science tends if unchecked to encroach on the domain of other sciences—theology on that of physics, and *vice versa*. In connexion with this we have many valuable remarks on the anti-religious tyranny of the scientific imagination. The second is, that physics and theology move in different planes: this might have to be modified in view of the unitarian tendencies of recent science, but it serves as a text for the thesis on which the writer spends all his ingenuity, that authority ought to let loyal and cautious specialists alone.

G. A. SIMCOX.

CURRENT LITERATURE.

The Barber's Chair. By Douglas Jerrold. (London: Chatto & Windus.)—There is always a certain interest in the first of a large family, and therefore it was perhaps worth while to reprint *The Barber's Chair* in a collected form, because there have been so many attempts since to make current affairs amusing by trying to fancy how uneducated people would talk about them. Besides, Douglas Jerrold was a really trenchant writer, while there is no evidence that

* It is to be noted, however, that when "repentance" is spoken of in the dialect of early monasticism, the speaker is much more likely to have "conversion" in his mind than "contrition."

he was capable of any thought too deep or too exact to pass without mutilation into a vulgar dialect.

Short as the papers are, the machinery becomes tedious: Slowgoe threatens to leave the shop too often, and the strong-minded Mrs. Nutts impresses us with a belief that her creator wished he could repeat his first success with Mrs. Caudle. The staple of the papers is an attempt to improve the current affairs of 1846 and 1847, with especial reference to the Spanish Marriages, the Equestrian Statue of the Duke of Wellington, and the Potato Famine, so as to teach the lower classes alternately to pity and despise the upper. Much of the wit is of the unpleasant sort which depends on a vehement assumption of belief in a religion which the author did not in the least understand, in order to disparage its professors or representatives by somewhat captious deductions from a somewhat arbitrary selection of its precepts. This is more obtrusive in the *Hedgehog Letters*, an earlier series, which deals largely with the surplice riots and the late Bishop of Exeter. It is every way inferior to *The Barber's Chair*, though the writing is quite smart enough to offer legitimate attractions to readers with a taste for plebeian Pharisaism.

What am I? A Popular Introduction to Mental Philosophy and Psychology. By Edward W. Cox, Sergeant-at-Law. Vol. II. (Longmans & Co.) The science of Soul, or psychology, as understood by Sergeant Cox, is mainly an explanation of the phenomena of what is commonly called "Spiritualism" by means of an hypothetical agency called "psychic force." He wishes to substitute for the materialism of current science a reasoned belief in the independent existence of the soul or spirit of man apart from that of its habitual companion or tenement, the human body. His definition of matter is, that which can be perceived by the senses: his definition of soul, is non-matter, or that which is not perceptible to the ordinary senses of mankind as at present constituted; and he goes on to suggest, though this is avowedly only conjecture, that perhaps the difference between the two may be that matter consists of atoms agglomerated into molecules which are actually or potentially perceivable by sense, and are further subject to the law of gravitation; while the incalculable motions and actions of pure soul would be explained by its being compounded of loose atoms, which do not gravitate, and can never be discerned except by means of the effects they produce upon the more knowable molecules. All this is, of course, quite wild, and the author has not even been at the pains to bridge the interval which separates his first guess, that there may be many existences not perceivable by human sense from his second fundamental assumption that the things not perceptible to sense (if such exist) must be the cause of all perceived sensible things. In fact, he regards force as an entity, in the same sense that matter is, only a degree more aetherial, impalpable, and self-directed; according to his own illustration, the "vital force" moves the body in the same way that steam moves the steam-engine, and he is indignant with the physicists who would attempt to distinguish between a force like steam, which has a perceptible existence, and the psychic force, which is only the name for an imagined cause of some groups of real observed phenomena. The same kind of confusion runs through his discussion of the relations of brain and mind; he criticises the materialist opinions (by whom held is not specified) that the brain is the mind, and the mind a unit which has to be all mad or all sane together, and argues that the brain is the many-functioned organ of the mind, ignoring the intermediate view that mind is the name given to all the conscious action of the brain. The application of this theory to the phenomena of somnambulism, clairvoyance, mediumship, &c., is that the mind may, in exceptional cases, direct the body without the intervention of the senses, as it

usually does with their intervention. The details are elaborated with so much apparent clearness and method, that the work is likely to be dangerously attractive to half-educated readers who will fail to notice the passages of vague thought which enable the writer to combine, without voluntary inconsistency, whatever incompatible doctrines attract him. One of his ingenious suggestions is that somnambulists may read thoughts without words, as insects clearly do when they communicate facts to each other; but he forgets that human thought, as we know it, has no existence apart from language, or the signs of communication. Sergeant Cox is more sceptical than Mr. Wallace in his treatment of ordinary spiritualist manifestations; he denies that any communications received through mediums convey information not previously known either to the medium or to the person receiving the communication; he is not quite satisfied about the "spirit photographs, and careful enquiry has convinced him that the evidence in favour of real apparitions, that is, spirits visible to four persons at once, is never strong enough to go to a jury upon." His moderation on these points makes it very difficult to disregard his full accounts of the "levitation" of dining tables and easy chairs, when untouched by either the medium or the circle; according to him the manifestations are not interrupted by the presence of a candid sceptic, only by that of convinced unbelievers.

Glimpses of Pre-Roman Civilisation in England. By Joseph Boulton, F.R.I.B.A. The writer of this pamphlet, which forms part of the Transactions of the Historic Society of Lancashire and Cheshire for 1873, endeavours to correct the popular conception that the inhabitants of these islands at the time of Caesar's invasion were savages, but we fear that the arguments he makes use of will not carry much weight, whatever may be the truth of the proposition which he seeks to maintain. Strangely enough, he has not a word to say about the Druids, and the systems of philosophy with which they have been credited, nor a single reference to Mr. Godfrey Higgins' books. Mr. Boulton has exercised considerable research and ingenuity in his description of the chariots, weapons, and ornaments of the Britons. He objects to the use of woad being confused with that of paint, as suggestive of South Sea Islanders and other savages, and believes that it was used "for protection against body vermin, which would naturally avoid coloured surfaces, on which they would be conspicuous." It is difficult for those who have had no experiences of the kind to say how far this preventive would be efficacious; but has Mr. Boulton considered that natural selection, and the power of animals to change their colours, might gradually have produced a breed which could have lived secure? Perhaps such a change accounts for the use of a different colour, saffron, for the same purpose in the Middle Ages, which Mr. Boulton also notices. The chief part of the argument is based on Celtic etymology, of which a few examples will suffice. The Greek name Cassiterides is explained as being purely Celtic, "the root being three words, *cas-sith-er*—i. e., the great money or medium for peace; implying that the natives were harassed and oppressed for tin, just as, centuries after, the Mexicans and Peruvians were for gold." "*Cas-sith, pro* Cashith, is possibly the root of the Roman name Cassius, and that surname seems to imply that Dio was concerned in the tin trade when he acquired his knowledge of Britain." Granting that the etymology is correct—a very large concession—does it follow that, because a man is named Smith, he is in the trade? Of Lattrigg, the name of a hill near Keswick, "the correct form may be *ladh rig* for *laghrig*—that is, the law or thing of the suzerain or *rex regulus*, which *rig* denotes." To a North-countryman, *rigg* must be a sufficiently familiar form of the common word *ridge*. The word *thing* is rather a favourite of the writer's, and the middle syllable of Nottingham and Hun-

tingdon is identified with it, without any attempt to show why it differs in origin from the same syllable in Buckingham, Rockingham, and other such words. But it is needless to multiply specimens; the above are typical.

Ecclesiastical Antiquities of London and its Suburbs. By Alexander Wood, M.A. Oxon. (London: Burns and Oates, 1874.) Mr. Wood's modest little volume will prove a useful handbook to any archaeological or architectural student who may desire to explore the treasures of ecclesiastical art which still remain in London and its neighbourhood. The book is compiled in a careful and scholarlike manner. Mr. Wood is well acquainted with the best sources of information, ancient and modern, and he uses them, as a rule, with sound judgment, and a fair amount of critical skill. The architectural details are described in a very competent style, with sufficient accuracy to satisfy the needs of the professional student, and yet not so technically as to be unintelligible to the general reader. A few woodcuts would, however, add greatly to the value of this portion of the book. The account of the development of the basilica into the Romanesque church deserves high commendation. The history and fortunes of the various monastic foundations are well traced. We have a good account of the great Benedictine abbey at Westminster, of the military orders, Templars and Hospitallers, who established themselves, together with the Dominicans and Augustinians, outside the walls, and of the mendicant friars, who lived and worked in the poorer quarters of the city. Mr. Wood explains and illustrates in a satisfactory manner the quaint names of many of the City churches; and he is usually safe and judicious when venturing into the perilous regions of local etymology. Occasionally, however, as in the cases of Charing, Kilburn, and St. Mary Overy, he has hastily accepted foolish traditional etymologies which his more sober judgment would have led him to reject.

Locked Out. By Ellen Barlee. (London: Henry S. King & Co.)—This is a very well-meant and mischievous little book; it might do Mr. Arch and his sympathisers, from Professor Beesley to the Bishop of Manchester, good; but they will not read it; it will do the squires and squires, and parsons and parsonesses, who will very likely read it and give it away to their pet Sunday scholars, a great deal of harm. The writer has tried to extract a lesson from the Cadmean victory of the eastern farmers, and the lesson is that a clever, opinionated working-man is better for being kept in leading strings by a wife who has been a nurse in a parsonage. It is assumed throughout that everybody is to lecture working-men and women, and to sit in judgment on them, and they are to sit in judgment upon nobody. It is assumed that the poor are always to exhibit the docility of children, because, unhappily, hitherto they have had little more ability than children to judge for themselves. It is assumed also that the only view of life upon which a poor man can act successfully is the conservative clerical view, and the writer does what she can to pledge the authority of Christianity, or rather of the Bible, to this assumption, in spite of the patent fact that the visible tangible success of men in every station of life except that of the agricultural labourer is in the main proportional to their readiness to emancipate themselves from this view. The dull plausible realism with which the writer works out her assumption only makes matters worse: onesidedness is more irritating when it looks unanswerable, and it is quite true that English farm labourers risk a great deal in trying to change their condition for the better. But even an agricultural labourer has wit to see that the eagerness of coal-owners to take full advantage of a rising market has more to do with the high price of coals than a strike of colliers. The real mischief is that the writer cannot see that there are two sides to the matter; and that she is

doing her best to undermine any practical respect that farm labourers may have for the Bible by ignoring the obvious fact that throughout both the Old and the New Testament, the poor man as such is presumably in the right, the rich man as such presumably in the wrong.

How Jane Conquest rang the Bell. By James Milne. (Longley.) A warm-hearted ballad of a sailor's wife who left her baby dying to rouse the village to help a burning ship, and found it recovered when she was brought back.

The Nature of Man regarded as Triune. By T. B. Woodward. (Trübner & Co.) When the science of mental pathology is constituted, there will be a new class of critics whose functions will resemble those of clinical lecturers. Mr. Woodward's lucubrations are only instructive as a "case" of the "reactions" established between an acute but not robust intelligence and a very confused milieu.

The Rural Life of Shakespeare as Illustrated by his Works. By C. Roach Smith. Second Edition. 8vo., pp. 65. (London: George Bell & Sons.) The object of the author is to prove that Shakspeare possessed an "intimate acquaintance with country life." This is a fact that has never been disputed. Mr. Smith does not, in precise terms, claim Shakspeare for a farmer's boy, but is "compelled to believe that he must have spent much of his youth in the country, in gardens and in farm-houses." This very innocent belief is supported by a long array of quotations, which we are told contain "expressions, allusions, and similes so essentially rural, that they could hardly have been used by any writer not of country growth, and can, indeed, be fully understood only by those who have been brought up in the country itself."

This is surely to praise the poet's learning at the expense of his good sense. Nature and the processes by which her bounty is made available for the service of man will always form the staple of the poet's similes; even with the most artificial this will be the case. The extracts which Mr. Smith has brought together certainly show that Shakspeare had a love of the country, and a general knowledge of its ways of life; but they fail, we think, to prove him to have been a farmer or a gardener. Mr. Smith's attempt is less extravagant than some similar essays, for it has antecedent probability in its favour. Born and bred in a small town surrounded by a rural district, it would have been strange if one so keen-eyed as Shakspeare had not borne with him to London pleasant memories of the fields and flowers of Stratford, and of the daily crafts of the homely folk whom he left behind.

Mr. Smith quotes Chalmers's remark about the tree on which Rosalind found the sonnet: "A palm tree in the forest of Arden is as much out of its place as the lioness in the subsequent scene." The palm is a country name for the willow, as our author triumphantly tells us, but there is still a lioness in his path.

The Cabinet Lawyer: a Popular Digest of the Laws of England, Civil, Criminal, and Constitutional, intended for Practical Use and General Information. Twenty-fourth Edition. (London: Longmans & Co.) When a book reaches a twenty-fourth edition there must be a large class of readers with whom it is popular, and it must be a subject of congratulation to lawyers that there is so numerous a body of persons who study the law, for of all studies there is none more dangerous to a layman. Cheap law books are the lawyer's best friends, and it is rather an awful contemplation to think how many law-suits have arisen from the perusal of the twenty-three editions of the *Cabinet Lawyer*. When a book of some 870 pages professes to give the whole law of England, it is obvious that the statements of the law upon each subject must necessarily be very brief; but the astonishing part of this book is that, although the notices are brief, it is difficult to find a subject that is not noticed.

We find a chapter on the New Judicature Act, on the Ballot Act, and the changes made last year by the Salmon Fishery Act; and as a rule the work has been corrected so as to show the effect of recent changes of the law in all the different branches. Here and there we find oversights, as when we are told that one of the sheriff's duties is to seize lands on attainders, forgetting that this duty is at an end, as lands since 1870 are not forfeited for treason. But these omissions are the exception, and as a whole the work reflects great credit upon the labour and care of the editor. To those persons who have a taste for cheap law and for being their own lawyer, we can recommend the book as a safe guide as far as it goes, and one that contains an immense mass of information which could not readily be found elsewhere. EDITOR.

NOTES AND NEWS.

MESSRS. BLACKIE & SON will publish in October: *The Story of the Scottish Church from the Reformation to the Disruption*, by the Rev. Dr. M'Orrie; a cheaper edition of Marcoy's *Travels in South America from the Pacific to the Atlantic Ocean*, illustrated with engravings and maps; a cheaper edition of Merton's *Cyclopedia of Agriculture*; and a cheaper edition of *The Book of Scottish Songs*, and of *The Book of Scottish Ballads*.

MR. PEARSON is about to publish a new volume of poems by Mr. Charles Grant, entitled *Studies in Verse*.

As a fact worthy of record in the annals of that most unattractive form of literature, popularly known as the Blue Book, we may mention that the First Report of the Royal Commission on Historical Manuscripts went through three editions, and has now been for some time, with its fellow, the Second Report, quite out of print. It has been determined, however, in consequence of the continued enquiries after them, to have a new issue. Of the last Report, the Fourth, two thousand copies were at once struck off.

THOSE who sympathise with the cause of female medical education will be glad to hear that a college has been opened for the purpose at 30 Henrietta Street, Brunswick Square. The premises are very convenient, and there is a large garden in which the dissecting-room can be placed, so as to avoid everything disagreeable to the neighbours. The council includes the names of Mrs. Garrett Anderson, Dr. Billing, Dr. Elizabeth Blackwell, Dr. Buchanan, Dr. Charlton Bastian, Dr. King Chambers, Dr. Cheadle, Mr. Critchett, Mr. Ernest Hart, Mr. Berkeley Hill, Professor Huxley, Dr. Hughlings Jackson, Dr. Murie, Mr. A. T. Norton, Dr. Payne, Dr. W. S. Playfair, Dr. Burdon Sanderson, and Dr. Sturges. The lamented Dr. Anstie, whose unexpected death was recorded the other day, was to have been the Dean of the new school. Many of the above names are also found in the list of lecturers.

THE Boston (U.S.) publishers have been busy with works relating to the late Hon. Charles Sumner. The volumes issued include a *Eulogy* by the Hon. Carl Schurz; a *Life*, by J. and J. D. Chaplin; a *Memorial* from the city of Boston; and *Prophetic Voices concerning America*, by the deceased statesman himself.

MESSRS. LONGMANS announce for publication in October: *Landscapes, Churches, and Moralities*, by A. K. H. B.; *Three Essays on Religion*, by J. S. Mill; *The Native Races of the Pacific Shores of North America*, by H. H. Bancroft; *The Ethics of Aristotle*, third edition, carefully revised and partly re-written, by Sir A. Grant; new editions of *Essays, Critical and Biographical*, and *Essays on some Theological Controversies of the Day*, by H. Rogers; *Hume's Essays*, edited by Messrs. Green and Grose; new editions of *Eight Years' Wanderings in Ceylon*, and *The Rifle and the Hound in Ceylon*, by Sir S. Baker; *Out of Doors*, and *Insects Abroad*, by the Rev. J. G. Wood; a

revised edition of *The Origin of Civilisation and the Primitive Condition of Man*, by Sir J. Lubbock; *The Transits of Venus*, by R. A. Proctor; the *New Shilling Arithmetic*, by the Rev. J. Hunter; *Time and Tune in the Elementary School*, by J. Hullah; *A Manual of the Elements of Vocal Music for School Use*, by F. L. Jones; and *The Houses of Lancaster and York*, forming the fourth volume of *Epochs of History*, by J. Gairdner.

M. TASCHERAU, Administrator of the Paris National Library, has been allowed to retire on a pension, with the title of honorary administrator. He is succeeded by M. Léopold Delisle, sub-director of the department of the manuscripts.

HERR JULIUS RODENBERG has been staying in London for some time, and is expected to leave soon for Berlin. His *Deutsche Rundschau* was to have appeared on the 1st of this month.

THE winter session of the Working Men's College, 45, Great Ormond Street, W.C., will commence on Thursday, October 8. Classes will be formed in Art, Languages, Mathematics, &c. The general meeting (on October 8, at 8.30 P.M.) will be addressed by the Right Hon. James Stansfeld, M.P. The Principal, T. Hughes, Esq., Q.C., will preside.

It is rumoured that a member of the Imperial family may perhaps be induced to act as Honorary President of the Congress of Orientalists which is to be held next year at St. Petersburg. The actual President-elect is Prince Vorontsof-Dashkof, a nobleman well known in Russia for his interest in Oriental studies. On the death of the last of the Princes Dashkof, who left all his property to his first cousin once removed Ivan Illarionovich Vorontsof, the Emperor Alexander I. allowed the latter in 1807 to assume the name and title of Count Vorontsof-Dashkof. His son is the President-elect of the Congress. The famous Princess Dashkof, it may be observed, the friend of the Empress Catherine II., and the President of the Imperial Academy of Sciences, styled herself Vorontsof-Dashkof (Vorontsova-Dashkova), Vorontsof having been her name prior to her marriage with Prince Dashkof.

In a letter to the *Times* of October 1, Mr. A. J. Horwood announces that in the course of his researches for the Historical MSS. Commission, he has discovered in the possession of Sir F. Graham, of Netherby, a Common-place Book of John Milton:—

"The volume," he says, "is divided into three parts, headed respectively 'Index Ethicus,' 'Index Oeconomicus,' and 'Index Politicus.' Milton's handwriting is on sixty-three of its pages; sometimes a few lines, sometimes parts of a page, sometimes a whole page. The table at the end contains between sixty and seventy heads by Milton's hand. The extracts under the headings of 'Matrimonium,' 'Divortium' and 'Rex,' are many. Some of the extracts in the volume are written by other hands, possibly by amanuenses employed by Milton after he became blind. One entry was certainly made after his death."

THE October part of *All the Year Round* contains a short, but not uninteresting, collection of Chinese proverbs.

MR. RICHARD GRANT WHITE, of New York, the editor of Shakspeare's works, has promised to write a paper for the New Shakspeare Society "On the Advantage to Shakspeare's Poetry of the Obsolescence of Language." Professor Hertzberg, of Bremen, has also promised to contribute to the Society a paper "On the Use of Metrical Tests in settling the Succession of Shakspeare's Works." We hear that there is a chance of Mr. Richard Grant White's able essay on the authorship of Shakspeare's *Henry VI.* being republished here in a separate form. Only twenty-five copies of the essay were issued separately in America, and when they turn up occasionally at public auctions, they fetch twenty-five dollars, about four guineas and a half. In this essay Mr. Grant White con-

tends that, when Shakspeare lifted 1,479 (of its 3,057, or less than one-half) of the lines of the early *Contention* into his *Second Part of Henry VI.*, and when he lifted 1,931 (of its 2,877, or more than two-thirds) of the lines of the early *True Tragedy* into his *Third Part of Henry VI.*, he was but transferring his own early work into his later, while the untransferred parts of the two earlier plays were poorer work, by Marlowe, Greene, and Peele.

PROFESSOR W. D. WHITNEY has a second volume of *Oriental and Linguistic Studies* nearly through the press. It is expected to be in England within a month from this time.

THE first part of the New Shakspeare Society's *Transactions*, and the first part of its *Shakspeare Allusion Books*, A.D. 1592-8, edited by Dr. C. M. Ingleby, are now in the binder's hands, and should be delivered to members of the Society next week.

MESSRS. MACMILLAN have now in the press Dr. Karl Elze's *Essays on Shakspeare*.

THE notes on Shakspeare left by the late Mr. Staunton have been examined, and found valueless, almost all of his manuscript having been printed.

MESSRS. BRUCKMANN, of Munich and London, are publishing Karl Rottmann's celebrated twenty-eight frescoes of Italian landscape from the arcades of the Hofgarten of Munich. They will be executed in watercolour print.

IN Mr. Morfill's introduction to *Poems referring to the Earl of Essex* for the Ballad Society, he will print the "Account of the Death of Essex (February 25, 1600-1, at 8 a.m.) from the Memories of Mr. Thomas Cook and Mr. Kidman," in the MS. Kk., 1, 3, in the Cambridge University Library, together with Forman's list of "Knights made in Erland by the E. Essex," in the Ashmole MS. 219, leaf 133: also "A brief relation of w^h happened in the expedition of the lo. lieut. generall of Ireland towards y^e north parte of that Kingdom from the 28 of August vntil the ix. of September, 1599," from the Harleian MS. 1291, leaf 40, back, and "The Queenes majesty's Prayer at the goinge owt of the Navye, 1597," when a fleet sailed under the Earl of Essex and Sir Walter Raleigh against the Azores, and to capture the Spanish Plate Fleet.

A DUTCH translation of Karl Wartenburg's novel *Robespierre* is being published by Laurens van Hulst, at Kampen. The same author's novel, named *Der Zweck heiligt die Mittel*, has been published with the addition to its title of *Bismarck un de Jenuiteorde*.

HERR FRIEDRICH SPIELHAGEN is publishing, in the Berlin *Volkzeitung*, a series of critical articles on the new exhibition of pictures at Berlin.

M^{ME}. JULIE HEINE, the aunt of the poet, died on September 1, at Paris, eighty-four years of age.

A PUBLIC subscription is being raised in Germany for a monument to Fritz Reuter, the Platt-deutsch poet.

TWO new political novels by Gregor Samarow, whose *Um Szepter und Kronen* created such a furore in Germany when first published two years ago, have just left the press in Stuttgart. The first, named *Der Todesgruss der Legionen*, treats the period of the Franco-German war; and the second, entitled *Die Römerfahrt der Epigonen*, is a narrative of the Congress of 1863. Everybody in Germany knows that "Gregor Samarow" is a pseudonym; but the author's real name is a mystery.

HERR ADOLPH WILBRANDT, of Vienna, as we read in several German journals, is engaged in publishing the posthumous works of Fritz Reuter, together with his life, and requests that all who possess any manuscripts or letters from the pen of the great Platt-Deutsch poet will send them

to his address in Vienna, Volksgartenstrasse. Herr Wilbrandt will of course return safely every letter or manuscript entrusted to him after perusal.

PAUL LINDAU, the editor of *Die Gegenwart* and author of the *Literarische Rückblickslosigkeiten*, is writing a history of the German and French stage. Herr Lindau is not only a very successful dramatic author—he wrote *Diana*, *Neue Magdalena*, &c.—but also one of the most prominent Berlin critics.

AT the recent Philological Congress at Innsbruck, the subject and authorship of the "Eggenlied" were brought under discussion, and after a careful examination of the most trustworthy texts, and minute consideration of the localities described. Professor Elze arrived at the conclusion that this poem, like so many other German mediaeval compositions, must be referred to the Tyrol. This favoured land of old lyrics, which is now permitted to add the name of Walter von der Vogelweide to those of Lintold von Seven, Hartmann von Starkenberg, Hawart, Walter von Metz, Günter von der Vorsh, and other singers of nearly equal renown, is, according to Professor Elze, undoubtedly entitled to the honour of giving birth to the "Eggenlied," as well as to the better known epics "King Redbeard," "Hugo and Wulf-Dietrich," and "Dwarf Laurence."

It is conjectured that the "Eggenlied," which treats of the Dietrich of Bern myth, was at a very early period carried by strolling bards to other lands, and subjected to various emendations and alterations; but at the present time nothing seems certain in regard to its author. In 1839, Herr von Schönhuth, the discoverer of the MS. which has served as the authority for our modern texts, edited the poem, and showed in his preface that there were no grounds for assuming, as had been done by Baron Lassberg when he had printed the poem in 1832 for private circulation, that it was written by "Master Seppen of Eppishusen." Herr Schönhuth was unable, however, to refer the poem with certainty to any known master of song. The descriptions of nature and scenery, and the topography of the districts through which the hero, Egge, is made to wander in his quest of adventures, which were to exceed in daring those of Dietrich of Bern, leave less doubt as to locality; and the familiarity of the writer with the places he describes, more especially in regard to the southernmost parts of the Tyrol, seems to be conclusive in regard to his nationality. The poem, like similar compositions of the Middle Ages, is full of absurdities and improbabilities, mingling all times and seasons, and confounding natural with supernatural things, but it has considerable merit in combining freshness of style with ingenuity of invention, and its careful revision would be a decided acquisition to German mediaeval literature.

IN the *Fortnightly Review* Mr. Leslie Stephen has a delightful paper on Mr. Disraeli's novels, in which he observes, "the texture of Mr. Disraeli's writings is so ingeniously shot with irony and serious sentences, that each tint may predominate by turns," and attributes to Mr. Disraeli the (very reasonable) opinion "that because Hipparchus was as great a genius as Newton, the views of the ancients upon religious and historical questions deserve just as much respect as those of the moderns. In other words, the accumulated knowledge of ages has taught us nothing." The article would be perfect but for an inconsistent complaint that an author whose ideal has (for his heroes) always been some kind of tangible success, has condescended to act the most cynical of his own romances. "The Caucasus," by Ashton W. Dilke, is remarkable as pointing out that like Siberia, this fragment of the Russian empire has a provincial patriotism that may easily become national. Mr. Beesley has a first paper on the "History of Republicanism," tending to show that since 1791 the republican party has been steadily growing through all the vicissitudes

which have thrown the masses who are not ardent politicians upon the side of revolutionary or reactionary governments; the paper is full of broad, well-considered, well-connected views, which may not improbably come to be considered well-established, though they rest upon many affirmations which could not be made good to the satisfaction of a court of justice. A total lack of perception that such a method is possible rather impairs the effect of the editor's vigorous attempt to enforce the teaching of "a recent work on Supernatural Religion," which is otherwise remarkable for a repudiation of Comte's elevated programme of proving the superiority of the new ideas by showing that they could supersede the old without a formal conflict. Dr. Appleton's first paper on "The Economic Aspect of the Endowment of Research" points out that England does very little research; that research as things are does not pay; that men in a position to carry on research without pay waste a great deal of work; that chemistry and physics are the only kind of knowledge the practical application of which pays; that consequently those parts of knowledge tend to be studied more than others. He argues that new knowledge is a source of permanent enjoyment [to the discoverer or the community?]; therefore, according to one of Mr. Mill's definitions an element of national wealth, but not an exchangeable commodity, and may therefore be reasonably provided for out of public funds. The funds are already provided for that purpose at the universities—where they have been usurped by the higher education—which if unendowed would be a better trade. Dr. Appleton will treat the last point in a future paper.

IN the *Cornhill* there is a too short account of the Chinese colonisation of the eastern plains of Formosa, and of the savage, probably Malay, tribes who maintain a precarious independence in the eastern mountains. The editor compares Crabbe to Balzac, and contrasts him; maintains that he is a poet because he almost makes men cry; and points out the wonderful truth of his description of the scenery of the East Anglian coast. The paper on Virgil's description of the sea is hypercritical. "Adnixi torquent spumas et caerulea verrunt," which is singled out for condemnation, is thoroughly pictorial. First we have the rowers getting forward, then the oars catch the water and come through with the spray flung spirally from them, then they go back over the unbroken blue for another stroke.

IN *Fraser* we have a translation of an article by Napoleon III. on the character of his wife, published in *Le Monde* December 1868, of which the MS. in his writing was found in the Tuileries after Sedan; an account of Sterne's daughter, with a few new details about her marriage and death before 1783; a neat little paper by M. Barrère, designed to prove that the national workshops were devised by M. Marie and M. Emile Thomas against Louis Blanc; and the commencement of an abridged version of the Chinese novel, *The Two Cousins*.

IN *Temple Bar* "The Frozen Deep" is to be concluded next month. We are to have the beginning of "Leah, a Woman of Fashion," by Annie Edwards. Walter Besant has a pleasant paper on Théophile de Viau, the libertine Huguenot poet; and "Southey in his Study" contains some fine observations as to that ponderous author's method of work.

Blackwood contains an account of Sir Banastre Tarleton, a cavalry officer in the Carolina campaigns and one of the handsomest ornaments of the Court of Carlton House. As an insolent critic of Wellington's first performances in the Peninsular War, he made a figure sufficiently individual to be worth remembering, though he was never very important.

IN the *New Quarterly Magazine* Miss Cobbe gives a lively catalogue of fabulous animals under

the title of "The Fauna of Fancy." We wish it may be followed by a rather fuller discussion of their mode of evolution. Nathaniel A. Hamer's reply to Mr. A. R. Wallace's articles on Spiritualism is worth notice for the statement that the apparatus for imitating the feats of *sou-disant* mediums is less cumbrous and costly than has been asserted. Robert Buchanan handles the character of Goethe from a physiological and democratic point of view, and succeeds in showing that it is of a nature to be contemplated with a malicious and not irrational satisfaction by barbarians like himself.

In the *Contemporary Review*, Mr. Lewes contrasts the universalising method of Lagrange in mechanics with that of Hegel in ontology, on the ground that Lagrange's formula admitted of verification, and led to new results. Mr. Bayne writes of Charles I. and his father with much kindness and some insight. Professor W. K. Clifford's first paper on the Philosophy of the Pure Sciences, is mainly devoted to the philosophy of Perception as expounded by Locke and Hume, and Kant's theory of *a priori* truth, which is criticised from the point of view that no belief can be necessary, except as conditioned by nervous structure, and is only valid for the experience of organic beings of that nervous structure. Mr. Fergusson, after a long and acrid indictment of Mr. Burges, advocates a scheme for the decoration of St. Paul's modelled pretty closely on that of St. Peter's, but much plainer, which he hopes might be thoroughly completed, which that of St. Peter's was not, for 100,000*l.* Mr. Matthew Arnold begins a review of objections to *Literature and Dogma* which seems likely to turn into a rather diluted restatement of the upshot of the book, with an attempt to show that neither miracles nor metaphysics will serve to "verify" the traditional beliefs of Christians. In the present number there are some interesting remarks on the Gospel miracles from the point of view of simple flexible common sense, which might perhaps condescend to entertain the supposition, that when the power of the human spirit is suddenly and inscrutably exalted, strangely direct exertions of its influence on external things might occur as well as be fancied. The writer obviously still fails to perceive the fundamental objection, that if we try to enjoy the Bible without believing it in the old-fashioned sense, it will never do us more good than a Greek statue or a Gothic cathedral. These also embody important truths which do not become more precious by being disembodied.

THE *Manchester City News* states that a capital index to the first and second series of the Transactions of the Lancashire and Cheshire Historic Society has been prepared by its President, the Rev. Dr. Hume, of Liverpool. The society, which has its headquarters in Liverpool, was founded in 1848, and has now issued twenty-four volumes, containing in full or by abstract the substance of 407 contributions, out of the 507 that have been read at the meetings. One notable feature of the volumes is the illustrations, of which there are in all over 530, including 316 engraved plates, 200 woodcuts, and 18 maps. The contents are most varied, and comprise biographies and genealogies, papers on the early history of Lancashire and Cheshire, on architecture and topography, on trade and the fine arts, on science and literature. Dr. Hume himself has been one of the largest contributors, and among the others are the late John Just, of Bury; the late John Harland, Dean Howson, A. Craig Gibson, Sir William Betham, Charles Hardwick, T. T. Wilkinson, General Sir Edward Cust, Professor Crace Calvert, F. W. Fairholt, Miss Farington, George Scharf, Sir James Simpson, Bart., M.D., Dr. John Robson, and Dr. Kendrick, of Warrington; the late George Ormerod, the historian of Cheshire; and Dr. R. G. Latham. The volumes contain a mass of valuable and entertaining material, elucidatory of the history and natural features of the two counties; and Dr. Hume's elaborate, comprehensive, and well

classified index will furnish a much-needed guide to an excellent but too little known series of publications.

As a small contribution to the biographical history of the Civil Wars, a path as yet almost untrodden by historical writers, but the attractive nature of which has been lately so well shown by Mr. Webb in his commentary on the *Military Memoirs of Colonel Birch*, published for the Camden Society, we give here a short version of the adventures of a Cavalier, as derived from some original documents of that period. The humble petition of Colonel Dudley to Charles II. sets forth that he had been employed by his sacred father in Scotland, and had been often plundered and wounded. His whole landed estate, of the value of 200*l.* per annum, had been sold, and his goods, stock, and ironworks, worth at least 2,000*l.*, destroyed. For his services to the King, in bringing men, arms, cannon, great shot, etc., into Nottingham, Derby, Worcester, Stafford, Oxford, etc., the Parliamentary forces had imprisoned him, thrown his sickly wife out of doors, and subjected one of his officers, Major Harcourt, to the indignity and discomfort of being "miserably burnt with matches." After his capture, Colonel Dudley and some others were stripped almost naked, and carried in "triumph and scorn" through the City of Worcester, and then kept close prisoners with double guards. This precaution notwithstanding, Dudley and one Major Elliott managed to escape over the tops of the houses. So hotly, however, were they pursued that they took to trees in the day time, and travelled all night. They again fell into the enemy's clutches when they reached London, were brought before the Lord Mayor, then before Parliament, and afterwards before that "cursed Committee of Insurrections." The Gate House prison now opened its arms to receive them, and they were condemned to "be shot to death upon the Monday before Colchester was surrendered, had they not escaped the Sunday with Sir Henry Bates, and others, at ten of the clock in sermon time, three or four gaolers opposing them." Since then Colonel Dudley had not enjoyed one penny of his estate for himself, his wife and family, "nor where to lay their heads." He further adds that he had been fed in private for three weeks in an enemy's hay-mow, and has passed on crutches through Worcester, Tewkesbury, Gloucester, and Bristol, in September, 1648. It was not until June, 1653, that he submitted to Parliament and petitioned to be allowed to compound for his estates, his name and description as of Green Lodge, co. Stafford, having appeared in the "Additional Act for Sale of Lands forfeited to the Commonwealth." A fine of 27*l.*, being a third of all the property that remained to him, was inflicted. The mastership of the Charter House was one post sought after by the petitioner, as a recompense for his sufferings: he obtained a grant of the office of serjeant-at-arms.

Among the manuscripts in the Imperial Library of St. Petersburg, we are told, is a valuable and extensive collection in the Chinese language, and a large number of autograph letters, state papers, reports, and memoranda of different sovereigns, ministers, kings' mistresses, and generals of all nations, formed by Doubrowski, who was attached to the Russian embassy at Paris, at the commencement of the Revolution. Profiting by the destructive spirit which prompted the leaders of that movement to annihilate every record and memorial of the aristocracy of the country, Doubrowski managed to secure for a trifling sum a great number of papers which had been sold by the Government to the shopkeepers. He was successful in saving some most curious manuscripts from the library of St. Germain, which was set in flames by the mob; one of them was the Epistle of St. Paul in Greek and Latin well known to bibliomaniacs, for which it is said an English amateur in vain afforded two thousand guineas. The Emperor afterwards purchased the

entire Doubrowski collection. Of royal letters in it are several of Henry VII. and Henry VIII.; specimens of Elizabeth's correspondence, too, are numerous, written chiefly in French, one of them being to Catherine de Medici, respecting Mary Stuart. There are also private letters of the last-named queen.

A DISCOVERY of some historical interest has lately been made at Neugrätz, where, in digging the foundations of a house in the town, the workmen brought to view a large burying ground in which a great number of bodies had been laid side by side in two regular rows. The preservation of the teeth in the jaws, and their extreme regularity, was the most striking feature in these remains, which were but little changed, each skeleton seeming complete. A few shreds of a woven fabric were the only other objects found, and it is conjectured that the spot had been used in the time of the Swedish wars to bury the dead who had fallen in the terribly sanguinary battle fought at Fraustadt, near Neugrätz, on February 13, 1706, between the Swedes and the allied Saxons and Russians. On that occasion the Swedes, under Renschild, killed 6,000 men and took 7,000 prisoners and thirty pieces of cannon, in an engagement lasting but three hours, and costing them only a loss of 1,500 men dead and wounded, although they had to win their victory against 19,000 allied Saxons and Russians, who were commanded by Generals Schulenberg and Wostrowitzki. The only traditional memorial remaining in the neighbourhood of the fierce encounters of which it was the scene, is to be found at a little public-house in Neugrätz, where is preserved a wooden tablet, on which are written in Roman capitals a few rhymes, ending with the statement that "on the day of the great Swedish battle eighty men fell by the sword on the tavern floor."

MYTHICAL national heroes and traditional heroic tales seem destined to fade more and more from the domains of history, in which patriotic self-love not unnaturally was ever eager to give them a place; and in the careful sifting of the sources from which the "Winkelried Saga" took its origin, another blow has been given to Swiss national assumption of superior personal prowess. When, in 1760, the Pastor Freudenberger showed too logically the probable foundation of the Tell myth in the Palnatoke legend of the Danes, which belongs undoubtedly to the ninth century, and demonstrated beyond a doubt that the Northmen had for ages before Tell or Gessler appeared on the scene, handed down from father to son the story of an identical apple-shooting, the Swiss rose in rebellion against the judgment, and in their outraged national pride publicly burnt at Uri, and in several other cantons, the impious work in which the gallant exploit of their hero-archer had been stigmatised as "une fable danoise." Now, however, Dr. Otto Kleissner, undaunted by the fate of Freudenberger, has submitted the accounts of Winkelried's valour and of the Sempach battle-scenes to a critical examination, and the result is to leave the story of his share in that day's victory, and even his very existence, unproved and unprovable.

NOTES OF TRAVEL.

SUBSEQUENT details which have reached us respecting the Austro-Hungarian Polar expedition confirm the opinions of those who urge that the perils of Arctic exploration are reduced to insignificance when met with the appliances of modern art. Special care had been bestowed on the building of the *Tegethoff*; the work had been done under Lieutenant Weyprecht's own eye; the stores and coal had been judiciously distributed in compartments, so as to strengthen her sides, and the result has fully justified any expectations which her commanders may have formed. Though ice-bound for twenty-one months, and during a good portion of this time exposed to the crushing violence of the surging pack, the *Tegethoff* was as

sound on the day of her abandonment as when she left the stocks! The previous year had been a favourable one for ice navigation, and Weyprecht and Payer themselves had reached a high latitude west of Novaya Zemlya, while several Norwegian fishing craft had circumnavigated the same islands with ease. But in 1872, an exceptionally low temperature, and a continuous wind from the north-east, had driven the pack southward, to 74° 30' N. latitude. Before the *Tegethoff* and the *Isbjorn* parted company, the former had made slight way through the pack, but further progress was soon barred, and the good ship never got free from the floes which then surrounded her. On October 10, 1872, the ice-fields began to move, and for five months their position was one of great danger from the frequent bursting of the ice and the severe pressure which threatened to crush the vessel. The stores had to be brought upon deck, and every preparation made for leaving the vessel, while the anxiety consequent thereon soon began to tell on the men's health, in spite of the efforts of the officers to keep up the spirits of the crew by arranging hunting parties (in which sixty-seven bears were killed) and other cheering devices—a most necessary precaution, it should be observed, in such trying circumstances. Happily, in February, the pressure ceased, and a massive wall of protecting ice had formed round the vessel. The fore part was then extricated by dint of blasting and sawing, but the stern was still firmly embedded, and in this plight the vessel drifted to the north-west. On August 31, 1873, the lofty mountains of Francis Joseph Land were sighted, but it was not till the close of October that a nearer approach admitted of a trial expedition consisting of Lieutenant Payer and six men being made. They were absent six days, during which time they ascended two promontories, named McClintock and Tegethoff respectively, and examined the adjoining glaciers, which were of immense extent. A second expedition started on March 30 along the coast to the north-west, and lasted a month. Observations could only be made by ascending to some height owing to the strong haze over the ice, but the latitudes of five promontories were fixed (the northernmost, Cape Fligely, proving to be in 82° 5' N. latitude), and a general notion of the configuration of the land was gained. It turned out to be about the size of Spitzbergen, and to consist of large masses of land intersected by fiords and fringed with small islands. A wide arm, named Austria Sound, separates these masses in latitude 82° N., and was discovered to run in a north-easterly direction as far as Cape Pesh. Beyond Cape Fligely a promontory was sighted—apparently in 83° latitude—and dubbed Cape Vienna. The northern portion of this land they named Crown Prince Rudolf Land, and in their progress along its shores the same remarkable phenomena noticeable in Smith Sound was here observed by the Austrians—i. e., an increase of temperature, and the presence of large numbers of birds, elks, seals, and other animals as well as traces of bears, foxes, and hares which lay on the ice. Their progress northward, as well as their return journey, was naturally hazardous, owing to the treacherous nature of the ice; but in spite of accidents (in one of which one of the sailors with the dogs and the sledge disappeared down a crevasse, but were happily soon rescued) they returned to find the *Tegethoff* in the same position in which it had been left. After a few days' rest, a third expedition was undertaken again to the west, and the ascent of Cape Brunn, a high mountain some forty miles from the ship, enabled the explorers to determine approximately the heights of the mountains, which in the north appeared to range between 2,000 and 3,000 feet, and to the south to attain a greater height, one named Humboldt Peak being at least 5,000 feet high.

On May 20 the colours were nailed to the masts, and the party, in three boats and three sledges, set

out for their journey homewards. For eight weeks an uninterrupted south wind baffled their best efforts, and half a mile a day was the utmost they could do. But in the latter half of July, when in the unusually high latitude of 77° 40' N., north winds set with rain, the ice was loosened, and the party got into free water. The crew and officers took it in turns to pull for land, and forty miles a day progress was made, so that on the second day the mountains of Novaya Zemlya were sighted. On the 29th some fishermen, belonging to the Russian schooner *Nicolay*, were seen in a boat, and on September 2 the rescued explorers were safely landed in Wardoe.

The reception in Vienna has been of the most enthusiastic description. Along a road about two miles in length, the spectators gathered in a dense mass, taking advantage of every available stage, platform, or vehicle to gain a glimpse of the brave explorers. Deputations upon deputations crowded together to greet them, and the latest telegrams inform us that subscriptions have been started for a national testimonial to the crew. It is characteristic of the daring energy which a struggle with Arctic perils implants in man, to ask to be led again to face the same dangers and strive for new laurels, and it is, therefore, with no surprise that we hear that a second expedition, embracing many of the old hands, is to start next year, and complete the work of discovery. We hope most earnestly that our Government will also consent to despatch an English expedition up Smith Sound, and so spur on both countries to a friendly rivalry in the hard but glorious field of Arctic discovery.

THE October number of the *Geographical Magazine* is rather above the average. Foremost is a spirited article on the Arctic campaign of 1874, in which the labours of the Dundee whaling fleet and the loss of the *Arctic* off Fury Beach are chronicled. Notwithstanding this *contretemps* it appears that the season has already proved a most successful one for the whalers, and by the end of the autumn it will probably be found that all the ships are full. The brilliant doings of the Austro-Hungarian party next find place, and a small sketch-map serves to illustrate this part of the article. The news of Mr. Wiggins's successful journey to the mouth of the Obi, and the numerous additional details respecting the Austrian party have come to hand only recently, and this, we would suggest, will afford scope for a second similar article from the same experienced pen. A paper read by Lieutenant Gill at the British Association, on his journey in company with Colonel Valentine Baker from Tehran along the south-east shore of the Caspian and the valley of the Atrek, forms the next article, and this is accompanied by a capital map of this part of Persia. When we consider the footing Russia has already at Chikishlar and Ashurade, her influence in Tehran, her threats against Merve, and the overwhelming importance of this route to India, we have said enough to show how desirable a good map of this region is. We have not space to notice the other articles, but we must draw attention to a note on the presence of a Russian officer in Tehran, with powers to conclude a treaty for the construction of a railway from Tiflis to Tehran. This note is supplemented by some important particulars in Wednesday evening's *Pall Mall Gazette*: Russia with her usual vigilance has arranged to give the capital and the supervision, the Shah's government is to give a guarantee of 6½ per cent., and England is fighting with might and main against the entire scheme. The concluding words of the note are so keen-sighted and just, that we cannot forbear quoting them:—

"But, after all, are we not bound to offer something in exchange for the undoubted benefits of which we are depriving Persia? And does not our diplomacy deserve the epithet of blind as well as selfish? Would it not be better policy, as well as more generous, to balance Russia's attempts to improve her political and commercial influence in Northern Persia by a corresponding advance in the south, than, as at

present, to use money and prestige to keep that unhappy country poised, like Mahomet's coffin, between the opposite poles of English and Russian civilisation?"

M. BERZENCZEY, a Hungarian traveller, has recently arrived at Bombay from Central Asia, after a series of adventures and difficulties. He had originally set out from Europe with the object of finding the cradle of his Magyar forefathers, which tradition places in the interior of Asia. But though amply furnished with letters of recommendation from both Vienna and St. Petersburg, and though emphatically a man of peace, with nothing more treasonable about him than a mild ethnological hobby, he was, on arriving at Vernoe, flatly refused permission to proceed into Kashgaria. We may here remark that this is strikingly characteristic of the independence of the military administration of Russian Turkistan; the ukases, diplomatic promises, and guarantees given at St. Petersburg are but *bruta fulmina* on the banks of the Oxus and Jaxartes; the real authority is the Yarim-Padshah, or half-emperor, as the Governor General of Turkistan is commonly called, and when at home he is, from all accounts, by far the better half. M. Berzenczey had found that in Europe the recent royal marriage had brought about a warm sympathy between the Russians and English, and, having had experience of English hospitality, he mildly expressed his gratification at the prospect of meeting the English mission in Yarkand. But this was a most unfortunate admission, as he was immediately taken for an English spy, and it was only on condition of his "turning king's evidence" and promising to report all he could on his return to Tashkend about the Amir Yakub-khan and his pretended friendship for Russia that he was allowed to proceed. M. Berzenczey innocently remarked that the request was so simple that he felt he could conscientiously obey it, but it is evident that Yakub-khan has a wholesome suspicion of aught coming from the Russian side, for he forthwith clapped the unfortunate scion of the Magyar race into prison as a Russian spy. Through the good offices of Sir Douglas Forsyth, M. Berzenczey was eventually released, and, provided by our countryman with a pony and a guide, he made his way over the Karakoram to Ladakh. Here his fame got ahead of him somehow and transformed him into a Russian Jesuit, but no more hindrance was offered to his progress, and he has safely arrived at Bombay, where he has published an account of his adventures.

FROM the recently published Reports on East Indian Trade Routes and Fairs, we learn that at last year's

"Sudya Fair a Chulkatta Mishmi appeared dressed in a thoroughly Chinese costume, and enquiry made elicited the information that there was a considerable traffic between the eastern Mishmis and the Lama country, as they called it (correctly enough, as Batang is Tibetan in language, &c.). Twenty-four days' journey with loads was given as the distance between Sudya and the Chinese plains, *via* the Mishmis' village, and the first place of any importance under Chinese government was styled by them Alupu or Alopol. . . The Mishmis came down freely to the Sudya fair, and it is probable that in this direction we could easily get to Batang, if allowed to enter by the Chinese. Indeed, our emissaries have been to the Tibetan frontier, where they were stopped and turned back."

We may mention that the Mishmis and other tribes bring down to the Sudya fair india-rubber, beeswax, musk-balls, ivory, &c., which they barter principally for various descriptions of cloth, salt, and beads of all kinds, including agate, cornelian, &c.

In another of these Reports, which relates to the Amir of Kashgar's territory, Sir T. Forsyth observes:—

"The country is said to be rich in mines of copper, iron, lead, and coal; so that, by the aid of European science and skill, machinery of all kinds may be in-

produced, and would be quickly appreciated where hands are so scarce. The habits of the people, too, are all favourable to industry. Instead of each man cooking his own food, and thus spending a valuable part of the day in culinary occupations, as is the case in India, there are innumerable restaurants and bakeries, and bread and meat pies are hawked about the streets, and a very cheap dinner is thus provided for the masses."

The writer, however, rightly warns British traders and travellers who may contemplate a visit to this country, that

"the people of Eastern Turkistan, though good-natured, friendly, and hospitable to Europeans, own to no inferiority of race, and will not submit to be roughly treated. They meet Europeans with perfect politeness, but on terms of equality, and any attempt at hauteur and domineering will be quickly and fiercely resented."

THE *Sarawak Gazette* observes: The Batang Lupars are wealthy owing to their perseverance in collecting jungle produce; they have also lately shown their willingness to work by offering their services to the engineer engaged in opening out the Lingga coal field. The labour of road-making, clearing, and carrying the sample 300 tons of coal through the jungle has been performed by them in a most satisfactory manner, and at contract prices considerably under those asked by either Chinese or Malays.

It appears from an article in the *Times of India* that in the reign of the late King of Siam the currency of the realm consisted of lead and zinc coins; subsequently, however, copper coins were introduced, but these were so easy of imitation, that counterfeits were circulated far and wide. Cowries were then brought into requisition, and the copper coinage was withdrawn. The heads of gambling-houses—privileged institutions in Siam—put in circulation what is called "a crockery currency," which they recall at pleasure. The King of Siam, during his visit to Calcutta, consulted the late Lord Mayo respecting the introduction of a new currency, and a new mint was erected at Bangkok, but it was never fully provided with machinery. On the King's return to Siam, he again addressed the Indian Government about the coinage question, but nothing appears to have been done in the matter. Meanwhile, arrangements are being made for the free circulation of a paper currency of very small value; the crockery currency (the exact form and nature of which is not described) will be recalled, and the paper notes will be used instead, till a proper coinage is determined upon, and issued by the Siamese Government.

WITH regard to the Arctic expedition of the ss. *Diana*, the *Daily News* understands that her master

"is convinced that the Kara Sea will be entirely open and free from ice till the middle of October; in fact, some of the Norwegian ships often linger there till that date. He sees no reason why steam communication should not be carried on annually between England and the Obi; but, only a partial survey having been made this voyage, he suggests that further effort ought to be made to ascertain the fact. The summer has been exceedingly unfavourable for the prosecution of the voyage. The ice remained in the sea owing to the calmness: . . . whereas, if there had been a few gales from the south-east, which there are generally in June, the ice would have been broken up and would have drifted towards the north. He suggests that a resurvey ought to be made with a shallow-draughted and powerful steamer, specially adapted for the purpose. It may be stated that no vessel has ever gone so far up the Gulf of Obi as the *Diana*, the latitudes and longitudes reached being 76° N. and 86° E."

In a work on China, published at St. Petersburg, and derived from official sources, Colonel Wen-jekow considers that direct trade between Russia and China Proper is only practicable *via* the Suez Canal. This opinion is borne out by the fact that

the freight per load of 2,520 lb. between Loskow and Kalgan (Chang Chia Kow) is 497 roubles, while from London by sea it is only 47 roubles! The great part of the tea sent to Russia now goes by Suez and Odessa.

THE *North China Herald* learns, upon good authority, that "the Chinese . . . are about to stop the coal trade at Keelung (Formosa), with the object of retaining the whole supply for Government use, and that the Japanese are taking a similar course in relation to the Takasima mines. If this be true, it looks as if each side were reckoning its resources with a view to the eventuality of war."

WE read in the *Movimento*, that the celebrated Italian Professor O. Beccari, who has been suffering from severe illness, was at the end of July still in the south-eastern part of Celebes, busy on important studies, and drawing maps of this almost unknown island. He intends afterwards to go to Western Australia.

HERZ ZITTEL, while travelling in the Libyan desert, made nightly observations on the amount of ozone in the air between January 11 and April 5. As he travelled by day, he could not make arrangements for screening the paper from desert sun-rays, and no observations were then made. Each exposure of the iodide of potassium paper lasted twelve hours. The experiments were made in the oases Dachel, Siuah, Chageh, and in Esneh, in the Nile valley, as well as in open desert. The quantity of ozone was found to be greater in the desert than in the oases or Nile valley, the proportions in January and February often being 7.3 and 4.91 of Schönbein's scale. Although the observations were only made during a portion of the year, they indicated a maximum of ozone in the winter (differing from Europe). Sudden changes were noticed on the morning of the 5th. The fluctuations depended on state of the wind, &c., being greater on fine nights, when there was much dew or hoar-frost. Cloudy skies always produced a diminution of ozone as well as dew. Dew plays an important part in the nearly rainless desert in nourishing the thirsty vegetation. In December, January, and February it was very heavy, frequently sopping the tent and moistening the stony ground like rain. In this region the north and north-west winds bring moisture from the Mediterranean, while south and south-east currents coming from the hot Soudan were extremely dry and with little ozone.

THE Russian town of Vernoe appears to be progressing as fast as most of the other chief towns of Russian Turkistan. A letter to the *Golos* says that among the new buildings in progress are a palace for the archbishop, a cathedral, and (last, but not least) a model prison. Great pains have been taken to plant and train young trees in the public streets, and it appears that, owing to the fortunate prevalence of a low order of civilisation, these efforts are likely to be better rewarded than those of our authorities with regard to the trees on the Thames Embankment, for there is every prospect of these trees in Vernoe in two or three years' time forming a sufficient shade to ward off the noonday heat—no inconsiderable advantage when the temperature rises to 120°. An adequate water supply has just been organised, and this has given a decided impulse to the building of houses, which are springing up on every side.

THE state of anarchy into which Spain has been thrown for the last year or two has had very different effects on the prosperity of the various commercial ports of that country. The political disturbances which prevailed throughout the district of Malaga during the greater part of last year gave an unusual stimulus to the trade of the port, owing to the great quantities of foreign goods which were introduced by contraband. The trade at the port of Alicante also showed a marked increase during last year, notwithstanding the partial

blockade it suffered from the frigates manned by the Carthagena insurgents. On the other hand, Corunna suffered extremely; its commerce was exceedingly reduced, and great distress prevailed. Barcelona also suffered both in trade and population. Many of the inhabitants were reduced to utter poverty and had to leave the place, to say nothing of the loss of life in actual warfare.

CHARLES SWAIN.

WHEN Southey visited Manchester he became acquainted with a young verse-writer, of whom he said, "If ever man was born to be a poet, Swain was; and if Manchester is not yet proud of him, she will be." The criticism and the prophecy alike were true. Charles Swain was a true poet, although his song welled up from the city of smoke instead of from a leafy wood or bosky dell, and notwithstanding the reticence which kept him from mingling in the stream of public life, he was held in great and deserved honour by his fellow citizens. Born in Manchester in 1803, he was an orphan at the age of six, and at fifteen became an assistant to his uncle, who was a dyer. Having worked for fourteen years in this uncongenial occupation, he became an engraver, a profession which he continued to follow until failing health prevented his personal attendance. His name will be found in the Commercial Directory of the present year. He died at his house at Prestwick, Sept. 22, in his 72nd year. From his mother, whose maiden name was Tavaré, a Parisian, he is said to have inherited his poetical temperament and the personal beauty which, faithfully mirrored in Bradley's canvas, made him, in early life, the *beau idéal* of a poet. His life was uneventful. His works are: *Metrical Essays*, 1827; *The Mind, and other Poems*, 1831; *Dryburgh Abbey*, 1832; *Life of Henry Liverseege*, 1833; *Dramatic Chapters*, 1847; *English Melodies*, 1849; *Letters of Laura d'Auverne*, 1853; *Art and Fashion*, 1863; *Songs and Ballads*, 2nd edit., 1868. Some of these works went through several editions. Twenty years ago many of his songs were household words in the New World, as Hawthorne has testified. Swain will be best remembered by his lyrics. Sweet and graceful, allying themselves readily to music, dealing with the every-day relations of life, fuller of hope than of heartbreak, they appeal directly to the popular heart. He is the singer of domestic love, the lyrist of those tender feelings which are the more deeply felt because so shyly exhibited. And when he steps aside from singing of the love and pathos of household life, it is, as befits the poet of his native place, to chant a hymn to Progress and to vindicate "the long pedigree of labour, the nobility of toil." Swain was not a mere lyrist, for in his poem on the Mind he has shown that his wings were strong enough for a long sustained flight. This poem, fine as it is, will not do so much to keep his memory green as the songs and ballads whose music is daily heard in hundreds of English homes.

THE SHAH'S DIARY IN ENGLAND.

Teheran : August 10, 1874.

WE all remember the letters which, when little schoolboys, we used to write to our parents and friends, telling them of some excursion into the country, of a visit to Madame Tussaud's and the pantomime, or of a journey to the seaside during our holidays. The letters were generally free from grammatical and orthographical errors, because they had been corrected by the master of the school, or perhaps by an elder brother; they were written in a sort of jolting way in a succession of small disjointed sentences, and the greenness or inexperience of the writer was too palpable not to be noticed at once. A collection of such letters now lies before me under the title of a "Journal." The author of the journal is no little schoolboy;

he is a high and mighty potentate; higher than the sun or Saturn, and so mighty that all the kings of the world are his vassals: he is the King of Kings; he is the Shah of Persia, and the journal in question is the "Journal of the Voyage to Europe." The book was published a short time ago, and contains 208 quarto pages of bad print. For a king of Persia to have written a book is a great achievement, and this is not the royal author's first literary attempt: some years ago he published, in the *Teheran Gazette*, a journal of a voyage he made in one of the northern provinces.

At times the book has the air of being a true diary, jottings, that is, not meant for publication; at others, it becomes, however, evident that he wrote the thing simply for the sake of having it published. The style is throughout of the very poorest description; to a Persian the book is on that account utterly unreadable. A Persian indeed might think the book was written by a foreigner with but a scanty knowledge of the language, and this is partly true, for the Shah hardly knows the Persian language, having up to his eighteenth year spoken nothing but Turkish. The Shah's descriptions of some of the wonders he saw are very amusing. When there is anything which he failed fully to comprehend, he says, "It was wonderful," or "We cannot write an explanation." Trivial occurrences he dilates upon with a quite remarkable eloquence, important events he finishes off with a few words. Regarding beautiful and high-born ladies, emperors, kings and queens, he says very little; but on negresses, Japanese jugglers, *cafés chantants*, and kindred subjects he is quite communicative. The book is full of absurdities and blunders which he might easily have avoided by calling to his assistance any one of his interpreters; it is, however, perhaps better that he did not do so, for he might thus have spoiled for us a highly delightful treat. If there were no errors at all in the book, it were more profitable to read a Murray's guide-book or a continental *Bradshaw*. The Shah very seldom gives us his opinion on the places he visited, but only gives a list of the sights which he saw during his tour.

We thought he would certainly have told us about the many reforms which it was said he intended to introduce into his country after his European tour, but no—not a word. As he has introduced no reforms or new measures excepting that he has had two or three streets paved in Teheran at the expense of the people renting houses in them, it is perhaps better that he has said nothing about them.

We will now see what His Majesty has said about us, and give a *résumé* of that part of the diary relating to his stay in England.

After taking farewell of the King of the Belgians, the Shah embarks with "Lorenson Sahib" (Sir Henry Rawlinson) on board the *Vigilant*, Captain MacOlintock, "known through his several voyages to the Northpole Islands." He admires the *Vigilant*, more especially the good things to eat in the state cabin; there were "peaches, white grapes, black grapes, small very sweet melons; the grapes were from hothouses, and very dear, one bunch of them cost two francs." He arrives at Dover, where the Duke of Edinburgh, Prince Arthur, and others come to meet him. The Duke of Edinburgh is a "very good-looking young man, with small beard and blue eyes," in parentheses he adds that he is very tall. "Prince Arthur is not so tall, has a thinner face, and is smaller made than his brother." On the road from Dover to London, noticing the fine fields of Kent, His Majesty says, "it is not necessary to write about England's agriculture, it is known all over the world." They pass "Sheshurst" (this, like most other European names, in Roman character); a wheel of a carriage catches fire, and "we were nearly all burnt." The crowd at Charing Cross was "endless," and calls forth the following: "London has some very handsome

women; on the countenances of both women and men are depicted nobility, greatness, dignity, and strength; it is evident that England is a great nation; the Almighty has to them especially given power and ability, sense, understanding, and education; no wonder they have conquered a country like India, and possess considerable colonies in America and in other parts of the world." Then he admires the English army, especially the cavalry, but deprecates the small number of the latter. The next day he visits the members of the royal family; at Marlborough House he is pleased with the tiger skins, and at the Duke of Edinburgh's residence stuffed lions and tigers strike him as worthy of notice. He visits the Duke of Cambridge, "who had a fine house, and is Commander-in-chief of the English army, especially of the artillery and arsenals; he is an old man but still strong and vigorous; his red and white face is very pleasing." "Then we went to the house of the sister of the Duke of Cambridge, who is married to the Duke of Teck; he is one of the German princes, and a very good young man; he has a small moustache." At the reception which he gave, the thing that struck him as most important were "the many jewels and pearls" which Rajah Duleep Sing, "a young man with fine eyes," appeared in. "Lord Gladstone was also there." After the state dinner given by H.R.H. the Prince of Wales, the Shah went to the Duke of Sutherland's: "he has half a million a year, a good and noble wife, and a fine house." The description of the entertainment well illustrates the style of writing in which the Shah excels. "There was a great crowd; we sat on a chair in a long hall; there were English ladies and princes, and an Indian prince, Naváb Názim of Bengal, with his son; they came to London two years ago on business; remained here; is the nephew of the celebrated Tippoo Sahib; at last the dance was over; having reached home we slept." No doubt he did, he had had a hard day's work. Next day he went to see Her Majesty at Windsor Castle; he again sits on a chair, and "the Lord Chamberlain having brought the order of the Jarretière," it was given to him by Her Majesty's "own hands." He in return "gave the Persian order of the Lion and Sun, with his portrait mounted in diamonds." He sees Prince Leopold, "very young and good-looking," attired in Scotch costume; this he explains as "a costume in which the knees are bare." "One daughter of the Queen, sixteen years of age, is always in the house and not yet married."

The Shah likes to eat well: whenever the meals are good he never fails to say so; here "we ate a good breakfast, there were some fine fruits." In the Castle grounds he sees soldiers: "although the English army is small, it is very well clothed, well drilled, and consists of young strong men," he remarks. After a description of the Castle, he adds—it looks very much like an afterthought—"Her Majesty's age is fifty, but she looks only forty; she has a genial and pleasant countenance." In the evening he goes to the City to the Guildhall entertainment. He notices the policemen, "there are 8,000." The next piece of information is somewhat startling, and ought to put the London police-defying street boys at their ease: "The people of London think very much of their police; anybody that shows any disrespect to the police must be killed." The Lord Mayor lives in "Cuid Hall." Wonderful to relate, the Shah on this occasion sat again on a chair, and we see that in every succeeding chapter he takes care to tell us the same thing—that is, whenever he does happen to sit on a chair. Then the Lord Mayor, the Shah, everybody drank Tós (toasts). He goes to sleep again that night, and next morning goes to "Volvitch." On the road he sees "working men of London, their faces blackened by coal-smoke;" at Woolwich, "English guns, like the ancient ones; they are loaded by way of muzzle, and not, like Krupps, from the breech." In the evening he is at the opera: "There was a great crowd;

Patti, one of the celebrated European singers, had been expressly brought from Paris; she sang very well; she is a very handsome woman; she took a long price to come to London. There was also Albani, a Canadian, of America, who sang very well and performed well." On the following day, *en route* to the Zoological Gardens, he is received with the usual "Hurrahs," he feels quite pleased, and says, "Really they cordially like me." The hippopotamus was "a wonderful thing." On the day of the naval review he had to wait a little at the railway station for the Prince of Wales and the Czarevitch. At Portsmouth he embarks on board the "*Victoria Albert*," captain "Prince Linoge," and sits down to breakfast. Then said H.R.H. the Prince of Wales, "Rise, let us go on deck to salute the ships; we rose and went on deck." Two sons of the Prince of Wales were also there. Then the Shah went on board the "*Assincourt*" commanded by Fips Hurubi," then visited the "*Sultan*, commander Vansitart," and returned to the "*Victoria Albert*." "The boat got under the steam wheel; the steam wheel began to move; the wheel very nearly touched our boat; if the wheel had touched our boat, which was not the will of God, we should all have been drowned; praise be to God the Almighty, the wheel stopped; we got on deck without further danger." In the evening in the Albert Hall he admires the entrance hall, the macaroni machine, and the exhibition of pictures painted by officers and men of the navy. Regarding the latter, he says, "Nowhere else have I seen such fine paintings." The great concert, the many performers and the great organ astonished him much: "Such a crowd nobody has as yet seen from the beginning of the world to now; there were 12,000 persons present, from no single one came a sound, all listened and looked on; it lasted more than an hour; when it was finished we went home and slept."

He goes to Liverpool, where two emigrant ships, that were to have sailed in the morning, delayed their departure till the evening expressly to give the emigrants a chance of seeing the Shah. The Duke of Sutherland's gardens and palace, to which he went after his visit to Liverpool, he describes minutely. "Lord Chose by Ostantene," the duke's near neighbour; "Mr. Cok," who had been captured by the Chinese; "Marquis de Staffert," son of the Duke of Sutherland, and "Lord Albert Gavr" and "Lord Renauld," the duke's brothers, were also there. They all played at bowls, a game that pleased the Shah much, particularly when they played in shirtsleeves. He also mentions the accident which happened to His Grace's butler, "Mr. Raite." In Manchester he observes, "Most ladies wear black dresses here, for if they were to put on white or coloured dress, it would immediately get black." In the evening he walked through the grounds of Trentham; they again played at bowls, and the Marquis of Stafford he thinks the best player.

Regarding his planting a tree at the Duke of Devonshire's place at "Chezike," he says: "This planting a tree is in Europe one way of showing respect to a great person." The next day was a Sunday; there were no theatres, no sights. He went to see Lord Russell, "who, although so old, has still a strong intellect, and belongs to the Vigh (Whig) party." For the enlightenment of his Persian readers he goes on: "It is necessary that it should be explained what Whig is. All the Ministers of the English Government are divided in two parts. The party which is now in office is that of the Whigs; at their head are Lord Gladstone as Prime Minister, and Lord Granville as Minister for Foreign Affairs, and other Ministers. The other party, which thinks contrary to the former, is called Tory; at its head are Disraeli and Lord Derby and others. Whenever the former party gets removed from office, all the Ministers and others are replaced by others of the second party." A very lucid explanation indeed. The next day at the Crystal Palace the crowd

was very great. His Majesty had his eye particularly on the ladies, who, he says, "were handsome and well-dressed." The gymnastics and the performances of the Japanese jugglers astonish him very much. The "Duke of Sutherland's daughter, who sat behind" him, he thought "very handsome." On the road home he sees some beggars: "The European beggars, instead of begging, play music, play the violin; they don't ask. If anybody gives money, they take it; otherwise they play continually." Just so. There is, however, another alternative: we might certainly send for a policeman, and as the organgrinder or fiddler would certainly be disrespectful, he would be killed at once, as we were told above. At St. Paul's "the head priest was ill, he was replaced by his lieutenant." On the occasion of his farewell visit to Her Majesty, the Shah assures his readers that "verily the English Queen has shown me the utmost kindness and friendship from the day of my arrival in England to to-day." Later in the day he visits H.R.H. Princess Helena and Prince Christian; the latter is "a prince of German Holstein; Prussia has taken his country, but the prince is still claiming it, and perhaps one day it may again be his own." He passes the grave of the Duchess of Kent, "Guint" as he calls it, and reaches the grave of H.R.H. the late Prince Consort; he leaves the bouquet of flowers which he had in his hand at the time on the grave.

At Madame Tussaud's his astonishment knew no bounds. He says: "It is hardly possible to distinguish which are living figures and which wax. I tried to distinguish between real living figures and those of wax, but could not succeed till the women got up, walked and laughed, and then I knew that they were living human beings." He goes once more to the Crystal Palace, specially admires the Jamaica ladies, who "were very handsome and had fine hair," and the figures of animals, which "are made so well that if a person wishes to look at them, ten days would not be sufficient time." Two balloons are sent off, his portrait is taken, and he leaves the Palace gratified. He goes again to the Albert Hall and buys some paintings, "ten or fifteen" of them. He relates the donkey anecdote as follows: "I saw a picture of a donkey, asked, 'What is the price?' The Director of the exhibition, who was a clever white-bearded man, read the price and said: 'One hundred pounds sterling;' this sum is nearly 250 tomans Persian money. I said: 'The price of living donkey is at the most only five pounds, why is a painted donkey so dear?' The Director said: 'Because it costs nothing to keep, it eats neither barley nor straw.' I said: 'If its keep costs nothing, it also does not carry anything, and cannot be used for riding.' We laughed very much." On the last day of his stay in England he visits St. Thomas's Hospital; Lord Argyll speaks of a Mr. Viteston (Wheatstone) and his wonderful printing telegraph; he goes to "Drurelam" Theatre in the evening. Here he sees "Nelson, a young Swedish woman, very talkative and artful, sharp; she earns much money in St. Petersburg and America, and is married to a Frenchman named Gousseau." With this chapter he finishes all he has to say on England; after apologizing for having written so little—"but really during a stay of only eighteen days nothing more could be written"—he says, "with the English everything is in order and well arranged;" he thinks that our ways of doing business and of finding something to do leave nothing to be desired. His final notice of England and the English people is that "the English people were really very annoyed and sorry on account of my leaving them," even while cheering him they looked "sorrowful." We have no doubt that as soon as a translation of the book has been published it will be read with avidity by many thousands. We do not think that the number of copies sold in Persia exceeds 300 or 400; its price in Teheran is 12 francs, which to a Persian is a high price for a book, now that the works

of the authors they like are sold for five or six francs.

A. A. SCHINDLER.

SELECTED BOOKS.

General Literature and Art.

- BUTLER, MRS. JOSEPHINE. *Memoir of John Greig of Dilston.* London: King & Co.
CLAMAGERIAN, J. J. *L'Algérie, impressions de Voyage.* Paris: Germer Baillière.

The next publications of the English Dialect Society are expected to be ready about Christmas.

MR. SKEAT's new selections from Chaucer's *Canterbury Tales*, for the Clarendon Press Series, are all in type, except the Glossary, and that is in the printer's hands.

CORRESPONDENCE.

NAPOLEON THE THIRD.

Reform Club, Sept. 28.

Will you permit me a few observations in reply to M. Coquerel's criticism of the first volume of my life of Napoleon III.? I have no fault to find with the tone of the critic: it is that of candour and courtesy. But I take exception to the passage of his paper where he dwells on the scandalous rumours that encompassed the Emperor's birth. It is true that I have not passed them in review, nor noticed the paper in the possession of M. Decaze. The Decazes have, to begin with, no right to be regarded as impartial witnesses in any matter where the honour or dignity of the Bonapartes are concerned. But I have shown, in letters and messages from King Louis, addressed to his wife during her confinement in 1808, that he recognised his child as his offspring; that he caused cannon to be fired in honour of the birth, and that nine months before the birth he was living with his wife at Caunterets. Moreover, the

proofs that King Louis acknowledged and knew the child to be his, are many. He claimed the custody of the infant in 1814; he was always ready to help him while he lived; he entered an eloquent protest when Louis Philippe's ministers locked him in Fieschi's cell; and, when he was dying, he implored King Louis Philippe—in vain—to let his only son approach and close his eyes. Moreover, he left Prince Louis a fortune. The more important of these facts are published for the first time in my pages—and they are extracted from the papers of Queen Hortense.

BLANCHARD JERROLD.

THE VEDAS AND THE BRAHMO SOMAJ.

Highbury: Sept. 23, 1874.

In Professor Max Müller's admirable address at the Oriental Congress, he stated that the original attempt of the Brahmo Somaj to base itself on the Vedas as an infallible authority, was stopped, and the movement turned into another channel, "simply by the publication of the Veda, and by the works of European scholars such as Stevenson, Mill, Rosen, Wilson, and others, who showed to the natives what the Veda really was, and made them see the folly of their way." Having made the Brahmo Somaj my special study, permit me to say that I think there is an error here. In none of the native accounts of this change in the Brahmo Somaj that I have seen, is there any hint of an acquaintance with the works of European Orientalists, and I much doubt if any such knowledge existed among the Brahmos at that period (1845-1850). The following passage from my *Historical Sketch of the Brahmo Somaj* (Calcutta, 1873), condenses the facts as I have gleaned them, my authorities being two native (English) histories of the Brahmo Somaj (one by K. C. Sen), a long and interesting speech of D. N. Tagore's in 1867, a published lecture of K. C. Sen's in 1863, and a letter from him to myself in 1872:—

"Up to this time the Vedas, which were then regarded as the infallible Word of God, had never been properly studied or even seen in their entirety by the members of the Society, as no complete set could then be procured in Calcutta. Four young Pandits were, therefore, sent (in 1845) to Benares to copy out and study the four Vedas respectively. But the result of their studies was to dispel the haze of infallibility that had surrounded those venerable Scriptures, which were found to contain glaring theological errors. Conflicts of opinion, which had for some time past been going on between the party headed by Akhai Kumar Datta on the question of Vedic infallibility, were now renewed with greater force. Finally, truth triumphed; the Brahmo Somaj aljured the infallibility of the Vedas, and ceased to be a Vedantic Church. The Vedantic element was eliminated from the Brahmic Covenant, the fundamental principles of Theism being substituted for it. . . . A compilation was published by Debendra Nath Tagore in October, 1850, entitled the *Brahma Dharma* (or Religion of the One True God), comprising the Brahmic Covenant and the Four Principles, appended to a careful selection of extracts from the Upanishads and the later Hindu Scriptures; and this volume was put forth by the Calcutta Somaj as a 'complete exposition of the principles by which we are guided in our religious belief.'"

S. D. COLLET.

RED LION SQUARE.

Bottesford Manor, Brigg: Sept. 26.

The story that the remains of Oliver Cromwell, after undergoing the indignities which the men of the Restoration heaped upon them, were buried in Red Lion Square, whether truth or fable, is older than 1799. In 1787 Sir John Prestwich, Baronet, published a curious quarto volume of documents and opinions relating to the great civil war. The materials out of which the book is made are mixed together in such a way as to give the reader but a low opinion of the compiler's accuracy or clearness of head. At p. 149, after giving an

account of the family arms of the Protector, he says:—

"His remains were privately interred in a small paddock near Holborn; in that very spot over which the obelisk is placed in Red Lion Square, Holborn.—*The Secret!* John Prestwich."

It would be of interest to discover if there be an earlier printed authority for this statement. It would seem that Sir John imagined that he was revealing something that was up to that time unknown.

EDWARD PEACOCK.

THE STYMPHALIAN BIRDS AND THE CRANES OF IBYKUS.

Athens: September 1874.

According to Apollodoros (ii. 5, 6), one of the works of Hercules, was to expel the obnoxious birds from Stympalia. In my conviction this myth refers to the cleaning of the two subterranean channels (*αραβήναι*) at the foot of Mount Apelaureon, whose obstruction would unavoidably convert the whole valley of Stympalia into a deep and inexhaustible lake. For this reason the Albanians, who inhabit the valley, go to great trouble to keep the channels clear, and have sunk in the rock, at the mouth of each of them, a row of big poles to prevent trunks of trees being thrown in. They also clean from time to time the one and the other channel under ground, after having made before the big poles a solid obstruction of earth and bushes. On a small hill, close to the mouths of the two subterranean passages, is a tile kiln, whose six or eight labourers are particularly charged with the cleaning of them. These men told me that the one passage, being $6\frac{1}{2}$ feet broad, falls at once perpendicularly 20 mètres, or 67 feet, and proceeds thence horizontally for 133 feet, where it is joined by the other channel. This latter being $8\frac{1}{2}$ feet broad, forms at once a perpendicular fall of $33\frac{1}{2}$ feet, runs thence horizontally below the Apelaureon, falls again $33\frac{1}{2}$ feet perpendicularly, and joins the other passage at the aforesaid spot. Of course, it is only possible to clean the two channels up to this junction. The opinion was universally accredited in antiquity that the water which finds its way by these two passages forms the river Erasinus, which issues from under Mount Chaon and flows into the Argolic Gulf. To my remark that a great many fish must be taken down by the falls and must perish in the subterranean passages, the brickmakers answered that all the fish swim up again in the falls themselves. I vainly endeavoured to prove that the fish could not possibly swim up the cataracts, which dash down with tremendous noise and vehemence; the men, six or eight in number, swore, however, solemn oaths that they were every day and every hour eye-witnesses of it.

The Lake of Pheneos, which is 9 kilomètres long by 7 broad, and $33\frac{1}{2}$ to 67 feet deep, did not exist in antiquity, and was even thirty years ago a fertile plain. It has been formed by the obstruction of the subterranean passage of the rivers Olvios and Aroamos. Unfortunately the mouth of the channel is in the deepest place of the lake.

The legend of Ibykus' murder denounced by cranes, is confirmed by Plat. *Phædr.* 242; Aristophanes, *Thesm.* 161; Plutarch, *de Garrulitate et de Nobil.* 2; Strabo i. 59; Ael. n. an., c. 51; Zenobius i. 37; Diogenianus i. 35; Makarios i. 50, and others; and it has given the subject to Schiller's splendid poem "Die Kraniche des Ibykus." In going to the Isthmian games, Ibykus was killed by robbers, and, when dying, he saw cranes, which he invoked as witnesses of his murder. The crime produced such deep sorrow and indignation with all the Greeks who had assembled at the games, that when some days later in the theatre one of the robbers saw cranes passing, and said to his companion: "Look there, Timotheus, the cranes of Ibykus," both of them were at once seized and confessed their guilt. But since there are no cranes in Greece, and none are

ever seen passing over this country, I presume that the legend does not refer to living cranes, but to those Mountains of the Cranes (*ὄρη τῆς Κρανίας*), which are situated in the northern part of the isthmus, and which, like Ibykus on his way from the port of Kenchreæ, the spectators in the theatre necessarily saw before them.

DR. HENRY SCHLIEMANN.

SCIENCE.

The Principles of Science: a Treatise on Logic and Scientific Methods. By W. Stanley Jevons, M.A., F.R.S. In Two Volumes. (London: Macmillan & Co., 1874.)

PROFESSOR JEVONS' work may fairly be called the first elaborate treatise upon the logic of the inductive processes which has been published in England since the appearance of the well-known works of Mill and Whewell. Hardly anyone will dispute that there was an opening for a reconsideration of such questions as these. To mention but two points:—the bearing of the Theory of Evolution upon the Principles of Classification, and that of the Conservation of Energy upon the functions of Hypothesis and Deduction in science, imperatively demand a re-examination of these parts of Inductive Logic. We therefore hail the appearance of a work on the subject by one who has so sound and extensive a knowledge of the physical sciences as that possessed by Professor Jevons.

With regard to the general character and design of the work, it seems to descend far more from the way of thinking of Whewell than that of Mill. Every reader of the latter will have observed the predominant importance assigned to the general method of direct and concrete Inductive enquiry in that work, both in respect of its foundation in the discussion and analysis of laws of causation, and in that of the inductive methods for ascertaining in any given case what is the cause of an assigned event. In Whewell, on the other hand, the detailed methods, the actual devices employed by the investigator in measuring and determining quantities, become the more important point, and the general problem discussed by Mill is almost entirely neglected. Here Professor Jevons goes with Whewell. It is singular, in reading his book, to find hardly any reference, comparatively speaking, to laws of causation, whilst the detailed methods employed by actual investigators (methods of measurement, approximation, and so on) are treated with admirable clearness and fulness.

The general spirit of the work is vigorous and bracing, and one cannot help feeling that these merits are to some extent due to a careful study of the mathematical side of the physical sciences. It would be going too far perhaps to say that no one who had not had a proper mathematical training could be trusted to talk rationally about either infinity or continuity in respect of magnitude; but it is impossible to read, for instance, the string of mathematical difficulties under the name of "Contradictions," given by Hamilton at the end of the second volume of his *Metaphysics* without being convinced that his profound animosity towards mathematics had not merely deprived him of a certain valuable kind of

training, but had also shut him out from acquiring a class of highly important conceptions.

As a consequence of his previous training I am glad to see that the Theory of Probability is adequately treated by Professor Jevons. Some remarks will be made presently upon certain views maintained by him, but he is probably the only recent English logician (except Boole and De Morgan) who has been really competent to form an independent judgment upon the subject.

I have found much difficulty in understanding from Professor Jevons' account what exactly he means by Induction, and what is the nature of the Inductive process. In some places he appears to use the term Induction in what may be considered its ordinary logical sense, viz. generalisation from particulars, the general proposition obtained being of course wider than the particulars upon which it is based. At the commencement of a chapter upon Induction he describes it in conformity with this view, as "the inference of general from particular truths." But from the main drift of his work, and from his usually terming Induction the "inverse" process of Deduction, I understand him to have in mind a much more complicated process than this. He means "inverse" in the sense in which in mathematics we call the Integral Calculus the inverse of the Differential. The former depends upon a knowledge of the latter; we have no regular and certain method of procedure in it, but can only note and record the processes of the latter, and then, under appropriate circumstances, employ them again in the inverse way to obtain the desired results. To take an example: given the laws of motion and that of force varying as the inverse square of the distance, we can by deduction obtain all the planetary motions. But given these motions, suppose we were required to ascertain the laws from which they must follow? This is what Professor Jevons (as I gather) means by Induction. That this is a process of enormous difficulty, and one for which no rules can possibly be given, is obvious, but is it what philosophers and psychologists have ever meant by Induction? It involves Induction it is true, but it involves a good deal more besides. Mr. Mill, no doubt, when he describes his "Methods of Inductive Inquiry," goes a little beyond the very simple use of the term above indicated, but he never contemplated such a process of analysis as that under discussion. He takes the events in the concrete, and endeavours to find what antecedent invariably precedes them, but his processes are nothing more than those spontaneously adopted by thoughtful men, refined by scientific culture and caution. Professor Jevons in his *Elementary Lessons in Logic* had adopted these methods of Mr. Mill with trifling alterations, and had assigned them a position of some relative importance, but nearly all reference to any methods of the kind is omitted in the present work. I think that this is to be regretted, for though such methods may be of little use in the profounder investigations of physics, they certainly are the methods adopted in many simple enquiries both in

science and in practical life, and therefore deserve notice by the logician.

The most perplexing point, however, is Professor Jevons' repeated denial that any real addition to our knowledge can be made even by imperfect induction. "No nett addition to our knowledge is ever made by reasoning." He mentions, it is true, "certain methods of reasoning in which we do pass altogether beyond the sphere of the senses, and acquire accurate knowledge which observation could never have given;" but these have really nothing to do with the nature of the inference, but only with its accidental application to certain classes of objects which happen to be incognisable by the senses: such, for instance, as the length and rapidity of the undulations of light, or the motions of the constituent molecules of a body.

Such a statement as that just referred to, about the impossibility of obtaining new knowledge even by imperfect induction, is so entirely at variance with previous views upon the subject, that it must be to some extent a verbal dispute turning upon the question, what is meant by new knowledge. He says of induction (vol. i. p. 168), that "it merely unfolds the knowledge contained in past observations or events." This we knew to be the doctrine of Whately and others about deductive reasoning, but it is surely new to hear it asserted of inductive reasoning. I do not feel quite certain on which of two reasons he would rest his case, or rather what relative importance he assigns to them, since some stress seems laid upon both. Does he mean that the real leap to the new is taken in the guess or hypothesis with which the Inductive investigator starts, and that this, from its hypothetical nature, cannot be called knowledge? Or does he mean that when we extend a property to new cases it is after all the *same* property? Either of these seems a most misleading use of words, especially the last, since even though the *property* be declared to be one and the same, the *objects* in which it is inferred to exist are entirely distinct, and therefore it seems idle to deny that there is new knowledge. De Morgan, to whom Professor Jevons refers so frequently in terms of the highest admiration, taught a sounder doctrine on this point when he said, after stating a profound mathematical proposition, and reminding his readers that it was entirely based upon axioms perfectly familiar to them, that they could "now ponder upon the distinction, as to the state of their own minds, between virtual knowledge and absolute ignorance."

This point is one of a large number which have left on my mind the impression that some of the merit of Professor Jevons' work is marred by the want of a psychological basis. The (to my mind) exceedingly important question whether logic is to be regarded from the objective or the subjective side, that is, whether the Material or the Conceptualist view of its province is correct, is rejected rather than neglected. He says (vol. i. p. 10) that he "need hardly dwell upon the question whether logic treats of language, notions, or things," one of these being the doctrine which Mill has described as "one of the most fatal errors ever introduced into the philosophy of logic."

A careful study of the work before us has certainly deepened my conviction of the importance of the distinction in question.

The principal distinctive feature of Professor Jevons' system is of course his doctrine that all reasoning consists of a process of "substitution of similars." As this doctrine has been already given to the world in a little volume published some years ago, we will not here enter into any detailed criticism of it, but one or two remarks may be made in passing. That deductive reasoning may be fairly expressed in this form is unquestionable (we will presently notice some of the advantages and disadvantages of so doing), but I cannot agree with Professor Jevons in thinking that the same holds true of inductive reasoning. He says (I. p. 2): "It must be the ground of all reasoning and inference that what is true of one thing will be true of its equivalent, and that under carefully ascertained conditions nature repeats herself." He also uses, to express the same doctrine, the (to my mind) perfectly distinct expressions "substitution of similars" and "substitution of identities." The latter seems to me a possible, and occasionally serviceable, way of expressing the principle of deductive reasoning; the former a decidedly misleading way of expressing that of inductive reasoning. When I have proved a property of a circle, I unhesitatingly apply the same property to any other circle, whether it be a plate or the visible disk of the sun; in so far as this is done deductively it is perhaps better to regard the common qualities as constituting an identity than a similarity merely. But when I come to inductive reasoning, when, having found that a certain number of ranunculaceous plants are unwholesome, I conclude that all the rest of the family will be so, there is nothing which can fairly be called an "identity" here, and in so far as there is any "substitution" this is a secondary and dependent process which does not deserve to be termed "the ground of all reasoning." I observe a similarity in some respects, and I therefore infer that it will be found in the remaining respect, that is, in the property of being unwholesome. But the substitution, so far as there is any, is not the fundamental thing here at all. It rests upon the uniformity of nature, and presupposes that uniformity; and it therefore seems to me that in making so little (as by implication he does) of that law, and not declaring plainly that substitution is at most only warranted as far as that law is conceived to justify it, he is inverting the natural priority of things.

It is true that Mill has overrated the qualities of his laws of causation in several respects; he has given them too high a character of certainty, and has too readily assumed that a due appeal to them will make inductive enquiry a simple matter of rule. Against these views Professor Jevons has rightly objected, but he seems to me to under-rate and neglect all reference to such laws to a degree which is utterly unjustifiable in any system of objective material logic such as induction demands.

One of the principal characteristics of the earlier or more formal part of Professor Jevons' work is his systematic employment

of a symbolic method somewhat resembling that of the late Dr. Boole. He maintains however (quite correctly as it seems to me), that the mathematical form given to the processes of reasoning by Boole rested on a misapprehension of the relative positions of logic and mathematics, and that in so far as the relation of genus and species applies to them at all, it is logic that should hold the wider place rather than mathematics.

The practical use of these symbolic methods may be regarded from two distinct points of view. (The deeper question, how far they are an adequate expression of the actual processes performed by the mind in ordinary reasoning, is not here discussed.)

First, as a mental training or discipline. In this respect I cannot feel convinced of their merit. Sparingly used, as a means of introducing the student to the use of symbols, they have their place, just as algebraical versions of geometrical problems are occasionally serviceable. But if the student comes to trust to them, or employ them at all frequently, they seem to me to deprive him of nearly all the good which logical training can afford. To go into particulars: much of the value of the early part of logic for the ordinary student seems to me to be summed up in a clear mastery of the distinction between, and the mutual relation to one another of connotation and denotation. But this is a distinction which these symbolic methods almost entirely ignore. Boole, I believe, did not even refer to it. Professor Jevons indeed does give an explanation of it, but as soon as he comes to the use of his symbols nearly all reference to it disappears, as must almost necessarily be the case with any system which makes the relation of subject to predicate an *equation*. Whilst on this point it may be remarked that Professor Jevons in discussing Mill's objections to the doctrine of the quantification of the predicate in his "Substitution of Similars," has hardly done justice to him by only referring to the few lines in his *Logic* where this doctrine is referred to. The full statement of his objections is of course to be found in his *Examination of Sir W. Hamilton's Philosophy*. An example drawn from Professor Jevons' own work will show the kind of confusion into which a student might be led by the use of symbols. He gives as a general formula of logical inference that "in whatever relation a thing stands to a second thing, in the same relation it stands to the like or equivalent of that second thing." He gives as an example of this comprehensive rule, "If C is a quality of B, C is a quality of A." Let B equal "gravitating matter," A equal "inert matter;" then, since all gravitating matter is inert, and *vice versa*, $B=A$; and we draw the conclusion that whatever is a quality of gravitating matter is a quality of inert matter. Surely this way of reasoning offers dangerous facility for confusion. For "quality" read "consequence," which is just as fairly included in the general formula, and we should draw the conclusion that what was a consequence of gravitating matter was a consequence of inert matter, or, as it would almost infallibly be read in interpreting the formula, that what was a consequence of *gravity* was a consequence of *inertia*.

If this mistake were made it would be entirely owing to this symbolic notation, and its necessary neglect of the distinction between connotation and denotation. When we want to express the fact that the group of things which possess one quality is as a matter of fact the same as the group of those which possess another, viz., that the two qualities always go together, the old form of proposition by subject and predicate, stated in the double form that All A is B, and All B is A, possesses distinct advantages which are lost by any system which, as in the quantification of the predicate, makes the relation an expression of equality in respect of denotation.

Another way in which these symbolic methods may be looked at is suggested by the reference to algebraical geometry. May we not, by their means, reach the solution of problems which would otherwise baffle our mental powers? The obvious objection is that whereas in mathematics the data are by comparison simple, and the reasonings long and intricate, in logic it is just the reverse, the reasoning being short and simple, and the ascertainment of the premises often a work of much complexity. Hence, the real difficulty is not in a part where additional resources of an argumentative kind can give much help. All the same it cannot be denied that there is a real gain occasionally to be obtained in this way, and that in consequence those who confine their attention to the old logic cut themselves off from very decided advantages. It is not implied by this that they could not work out their conclusions in most cases by their own methods, but that practically they would be extremely likely to fail in the task. Take a simple example. Suppose that there were, in connexion with some company, two bodies of bondholders and shareholders respectively, and that a board of arbitration were appointed. Let us have simply the following data given, that every member of the board was either a bond- or a shareholder, but not both, and that all the bondholders were on the board, and let it be asked, What conclusion can be drawn from these data? I suspect that many a really competent logician of the old school would be at a loss how to answer the question, although the resources of his science are really quite competent to draw the correct conclusion that, from the given data, it follows that no bondholders are shareholders at all. The reader had better make the experiment if he has any doubt, adopting, of course, the only sound test of not telling beforehand what the answer is. But employ one of these symbolic methods of the algebraical type, whether Boole's or Professor Jevons', and the answer will be readily discovered. The mathematical conception of elimination has been grasped, and we know in consequence what to seek and how to seek it. If this is the case in so simple an example as that just mentioned, it may well be understood that in more complicated processes of reasoning such methods may give a certainty which could never be attained by the old logic, not only that a conclusion has been found, but also (what is far more difficult) that *all* the relations which must exist among the data have been ascertained.

Professor Jevons claims one or two advantages for his system which it hardly seems to me to possess. One of these is that by attention to the simple rule of substitution, fallacies are avoided with far more certainty and simplicity than by attention to the old rules. Against this it may be urged that these rules were framed to meet the ordinary form of proposition which is not expressed as an equation, and that to employ the method of substitution we must either change our grammatical forms of expression, or, when once we have got our data, carry on the rest of our reasoning in symbols, and translate them back again into common language at the end; a procedure which would have many practical disadvantages.

Again, in speaking of the syllogism in Darapti, "Potassium is a metal, potassium floats on water, therefore some metals float on water," he objects that this conclusion "leaves out some of the information afforded in the premises," whereas his own conclusion, stated in the form "Potassium metal = potassium floating on water," retains them all. I cannot see the merit of this. Surely, as the old expression "discursive thought" implies, we designedly pass on from premises to conclusion, and then drop the premises from sight. If we want to keep them in sight we can perfectly well retain them as premises; if not, if all that we want is the final fact, it is no use to burden our minds or paper with premises as well as conclusion. All reasoning is derived from data which under conceivable circumstances might be useful again, but which we are satisfied to recover when we want them.

An excellent feature in Professor Jevons' work is the important place assigned in it to the Theory of Probability. There are many points in his treatment of the subject which invite discussion and criticism, but space compels me to notice only one or two, which at bottom involve the same principle, viz., the relation of the theory to experience and fact. Take, for instance, the Method of Least Squares. Much of what he says here is excellent. In particular he points out (what too many ignore) that, so far from our having any right to suppose that the Law of Error is always the same, we may be pretty certain that there must be many different laws of error for different classes of observations, &c. And yet in one place at least he seems to use the expressions "Law of Error" and "Method of Least Squares" as synonymous, thereby throwing much confusion upon the important question whether those (probably the great majority) who claim for the Method the most "probable" results do thereby imply that the law of error must always be the same. Laplace (as Mr. Todhunter and the late Mr. R. L. Ellis assure us) never claimed this for it, but only called it the most "advantageous" method. What is the force of this distinction? In particular, do those who claim for it the most "probable" results mean that in the long run it will keep us nearer to the truth than any other method would? And, if so, can this be the case, whatever may be the nature of the law of error in any particular case?

Again, with regard to the rule of "Pure Induction," as De Morgan called it, the rule

which assigns the probability that an event which has happened any given number of times will happen again. It is obvious that the rule is not really correct as a matter of fact, the fact of a thing having happened a certain number of times being sometimes an indication that it is more likely to happen again, sometimes less likely, whilst sometimes it leaves the probability unaffected. To say that the rule is only to be used where we have no other data, hardly meets the case. Is it the fact, on the average, that things are physically so arranged as to justify the law? Professor Jevons very rightly insists that probability is not the science of belief, but of *correct* belief. When I assert that the odds are eight to one that an event which has happened in a certain way seven times will so happen again, I have really committed myself to the assertion that if we go on long enough we shall find that eight out of nine of the events which have happened in that way, to that extent, happen so again. Is this so? and if it is, how is it brought about?

There are some minor points on which Professor Jevons has diverged from the usage of most logicians, without, I think, making an improvement. For instance, he maintains that logicians are in error in asserting "that singular terms are devoid of meaning in intention, the fact being that they exceed all other terms in that kind of meaning." He refers to the *Elementary Lessons in Logic*, in which the objection is urged that "if the name John Smith does not suggest to my mind the qualities of John Smith, how shall I know him when I meet him?" Each of us may have his own mode of recognising an acquaintance, just as we may recognise any one of a class of things by attributes which are no part of the class name, but it does not follow in the former case any more than in the latter, that these must be part of the "meaning" of the name.

Again, he objects against ordinary logicians, that the rule is not necessarily true that two negative premises invalidate a syllogism, giving the following example: "Whatever is not metallic is not capable of powerful magnetic influence; carbon is not metallic; therefore carbon," &c., which he says has "two distinctly negative premises." The reply clearly is, that if "not metallic" is to be regarded as the predicate of the minor, then the minor is affirmative; if "metallic" is predicate, then there are four terms.

With regard to the correctness of the examples chosen by Professor Jevons, of course none but a scientific expert would be capable of a general conclusion, but they offer an admirable range, and are clearly expressed. I have noticed one oversight on an astronomical point. He speaks (in reference to the existence of a resisting medium) of Encke's comet being *retarded*. He is, of course, quite aware of the fact that the angular velocity of the comet is *accelerated*, and has stated it perfectly accurately elsewhere in these volumes. I should, indeed, have regarded it as a mere misprint, were not the same statement made in the *Elementary Lessons in Logic*, p. 255: "The motions of several comets have in this way been calculated, but it is observed that they return each time a little later than they ought. This retardation," &c.

There is also a passage which will, I fear, bring down the Kantians upon Professor Jevons if any of them chance to read his volumes. He attributes to Kant the doctrine that space is a necessary form of thought, and also (as I understand him) that the mind as a *noumenon* has any relation to space.

"So far am I from accepting Kant's doctrine that space is a necessary form of thought, that I regard it as an accident, and an impediment to pure logical reasoning. Material existences must exist in space, no doubt, but intellectual existences may be neither in space nor out of space," &c.

It may be remarked in conclusion, that students of his book have reason to be grateful to him for giving not only a table of contents, but also a full and complete index at the end. J. VENN.

Les Premières Civilisations. Par Fr. Lenormant. In Two Volumes. (Maisonneuve et Cie, 1874).

Mémoire sur la Date des Ecrits qui portent les noms de Bérosee et de Manethon. Par E. Havet. (Hachette et Cie., 1873).

M. LENORMANT'S indefatigable energy in presenting to the world the latest discoveries of historical and philological science, and drawing from them new and striking conclusions of his own, is certainly matter for astonishment. Hardly have we laid down his works on the history of the Phœnician alphabet and the language of ancient Babylonia, when we are called upon to read the two charming volumes which the new year has produced. They contain, it is true, only reprints of papers already published elsewhere; but the papers have been enlarged and corrected in accordance with the most recent knowledge. This is especially the case with the chapter on "The Deluge and the Babylonian Epopœe," which was reviewed in the ACADEMY a year ago in its original form.

The book is a most interesting and important contribution to archaeology, and we may safely predict for it the same popularity that the author's *Manual of Ancient History* has enjoyed. Some idea of its varied character may be gained from a list of the contents. The first chapter takes for its text M. Hamy's *Précis de Paléontologie Humaine*, and gives an account of the rapidly accumulating proofs of the great antiquity of man, which is referred back as far as the Miocene period on the strength of the discoveries of M. l'Abbé Bourgeois, and his friend M. l'Abbé Delaunay. Then follows "The Neolithic Epoch and the First Use of Metals," full of ingenious suggestions; and so we pass on to a sketch of the art and dynasties of Egypt and the Poem of Pentaur, an Egyptian Homer of the thirteenth century B.C. After that come "Researches on the History of Animals," on which so much light has been thrown by the decipherment of the monuments of the ancient world. Thus we find that whereas the ass was originally domesticated in Egypt, and was introduced by the Semites to the Greeks, the horse, on the contrary, was first tamed by our Aryan ancestors on the plateau of the Hindu-Kush, and did not make its appearance in Egypt until about 2500 B.C.

The domestic cat, again, caught its first mice for the Nubians of Africa, not appearing in Egypt until the period of the twelfth dynasty, so that the Pyramids had grown grey with time before a Juvenal could have reproached the inhabitants of the Nile valley with their worship of the sacred cat. The very name of the animal still bears witness to its African origin, and we may even now trace its kindred in the Bornu *gûda* and the Nuba *kaliska*. It is curious how almost entirely ignored it was by those nations of antiquity with which we are best acquainted. Not once is it mentioned in the Bible, the apocryphal Book of Baruch excepted, and the rare appearance of the animal on Greek and Roman works of art has long been a subject of remark. M. Lenormant, however, is mistaken in saying that it has been found only on a coin of Tarentum, and a sepulchral stone at Rome, since one of the Pompeian frescoes in the Museum of Naples represents a fine specimen of the domestic cat.

The first volume concludes with the Egyptian "Romance of the Two Brothers," which bears some similarity to the story of Joseph in Genesis. M. Lenormant points out its Semitic origin and connexion with the myths of Adonis, of Atys, and of Dionysus Zagreus.

The second volume deals chiefly with Chaldaea and Assyria. Those who wish to read about the ancient Babylonian Epic, with its twelve legends, answering each to the signs of the Zodiac and the months of the year, and introduced as episodes in the history of the solar hero, Gisdhubar, will have their curiosity abundantly satisfied. Two of the legends have been recovered in almost a complete form; one of them being the now famous story of the Deluge and the passage of the Sun-god, Tam-zi, or Noah, over the floods of winter, the other, the descent of Istar or Astarte into Hades in search of her dead husband, the Assyrian Adonis. Fragments of others of the legends are in our hands, but we must await the result of further explorations in the East before we can possess the whole of an artificial epic, which is at least as old as the sixteenth century B.C.

The chapter on this early epic is followed by one entitled "The Chaldaean Veda." This gives translations of certain ancient Babylonian hymns, addressed to the chief gods of the Pantheon, and not unlike those of the Hindu Rig-Veda. The hymns formed the basis of the ritual of the Accadians—the Primitive non-Semitic population of Chaldaea—as well as of that which the Assyrians borrowed from them, and have come down from the most remote antiquity. Some of them are marked by a highly poetical spirit, and afford us curious glances into the religious beliefs of the pioneers of civilisation in Western Asia.

The following fragment of one which is dedicated to Merodach will give an idea of their character:—

"Before thy hail who can withdraw himself?
Thy will is a supreme decree, which thou determinest in Heaven and Earth.
Towards the sea I turn myself, and the sea is calm.
Towards the plant I turn myself, and the plant is withered.

Towards the bounds of the Euphrates I turn myself, and
The will of Merodach has overthrown its bed.
O Lord, thou art Supreme; who can equal thee?
Merodach, among the gods, the prophet of all glory."

M. Lenormant next describes the stirring events that characterised the long life of Merodach-Baladan, whom he calls "a Babylonian patriot of the eighth century." It was the period of the consolidation of the Assyrian power, and the subjugation of Chaldaea, as well as of Assyrian influence upon the course of Jewish history. The chapter is an extremely interesting one; but I do not think that the attempt to harmonise the monumental and Scriptural accounts of Sennacherib's campaign against Hezekiah will be considered successful.

The last chapter of the book is upon "the Legend of Kadmus and the Phœnician Settlements in Greece." A large mass of curious information bearing upon this subject has been brought together; but modern criticism will hardly be disposed to discover the same amount of historical truth in the doubtful myths of Greek antiquaries as our author. Ingenious combination too often leads him into the perilous path of historical divination, and we wish that he had refrained from comparing Ophir with Ephyre, "The Watch-tower," the ancient name of Akrokorinthus, or from making chronological calculations on the assumed reality of a Trojan war and rival dynasties at Thebes, or from seeing in the Homeric poems the production of an individual poet who lived shortly after the mythical age.

M. Havet has no wish to question the historic truthfulness of the writers known as Berosus and Manetho. That, indeed, has been too signally confirmed by Assyrian and Egyptian discovery for such an attempt to be any longer possible; but it is quite otherwise as regards the dates traditionally assigned to them. Both Berosus and Manetho are said to have lived in the third century B.C., the one under Antiochus Soter, the other under Ptolemy Philadelphus; and we have to depend upon third and fourth-hand writers for the miserable fragments of their works which have come down to us. M. Havet starts with assuming the improbability that the two authors who translated the native records of Chaldaea and Egypt into Greek should have been contemporaneous, at a time, too, when the priesthood of those ancient nations had not yet been sufficiently Hellenised to dream of such a work; and he goes on to subject the various notices that we have of them to a critical examination. He points out that Josephus is the first who gives extracts from them, and that they seem utterly unknown to Diodorus, who specially concerned himself with the history of Egypt and Babylonia, while Jewish leanings show themselves in both. But his strongest argument unquestionably is that the *Epitome of Alexander Polyhistor*, from which the various quotations of Berosus that we possess have all been originally derived, was really the work of a Jewish forger, who was acquainted with the Third Book of the Sibylline verses.

M. Havet's criticism is able and ingenious, but I confess that it does not convince

me. Diodorus, at least, was acquainted with the astrological work of Berossus, and the silence of the writers anterior to Josephus may easily be accounted for, partly by their not troubling themselves with the early annals of foreign nations, partly by their preference for Hellenised legends, partly by the scantiness of the literature of that period which has been preserved. Still less can I agree with the constructive portion of M. Havet's monograph, in which he seeks to place Manetho shortly before the Christian era, and Berossus even later. In any case, however, his arguments deserve consideration; and the confidence with which the traditional age of the two authors has been repeated by writer after writer will no longer be justified. A. H. SAYCE.

NOTES AND NEWS.

THE first volume of Dr. Corssen's great work, *The Language of the Etruscans*, has just reached us. As it contains 1,016 well-covered pages, it will require careful study before it is possible to pronounce an opinion of its merits. One thing, however, is clear at first sight: it is the work of a scholar, and contains the results of nearly thirty years of hard labour. As was sufficiently clear from his earlier publications, Dr. Corssen considers the language of the Etruscans as an Arvan language, and as an old Italian dialect, which during centuries has suffered much from phonetic decay. He translates in the first volume all important inscriptions, not excluding the *Cippus Perusinus*, and he promises in the second volume to give a complete grammatical analysis of the Etruscan language. This second volume, therefore, will be the most important for a systematic study of the language of ancient Etruria, and we hope that Dr. Corssen will not keep us long waiting for it. In the meantime, as a specimen of his treatment of Etruscan inscriptions, we give an abstract of his remarks on the dice which have lately attracted so much attention. (See *ACADEMY*, 1874, p. 15; 372; *Annual Address, Philological Society*, 1873, p. 10).

"The pronominal form *huth* is likewise found in the inscription of two dice, made of ivory or bone, which were discovered in 1848 by Campanari. Neither the place where they were discovered, nor the place where they are preserved is given, and I have looked for them in vain in the Etruscan Museum of the Vatican and other Italian collections.* On the six sides the brothers Sec. and Dom. Campanari read the following inscription:—

Mach thu zal huth ci sa.

As the inscription exists twice, we cannot doubt that it was read correctly. Dom. Campanari asserted that these six groups of letters or syllables were the six Etruscan numerals from one to six. This guess has since been accepted as a fact by many scholars. But one ought to have considered, from the beginning, that the use of numerals, instead of figures or pips, would be extremely inconvenient for the practical purposes of dice. Secondly, those who held such a view ought at least to have produced other ancient dice, in which numerals are used instead of figures. Nowhere have I been able to discover such dice. But, thirdly, if the syllables were to be considered as numerals, a real proof was required that they could be nothing else but numerals. Instead of this, we have had nothing but guesses and theories, which require no refutation. Lately Mr. Isaac Taylor has read the groups on the six sides of those fatal dice, as follows:—

Mach = 1,	Se = 4,
Ci = 2,	Thu = 5,
Zal = 3,	Huth = 6,

and has declared these six numerals to be identical with those of one of the Altaic branches of the Turanian family.

* They have since been discovered at Paris. See *ACADEMY* (vol. v. p. 522).

Max Müller (*ACADEMY*, 1874, Jan. 3, p. 14; April 4, p. 473) has shown, that even if these Etruscan words were numerals, their Finno-Altaic origin would by no means be certain. But out of the twenty-two so-called numerals which Mr. Taylor imagines he has found, eighteen are no Etruscan words at all, but mere rags of words and lumps of letters, put together at random by Mr. Taylor, who is not so far master of Etruscan epigraphy as to be able to read or divide Etruscan words correctly. Out of the remaining four words, *huth ci sa mach*, three are pronominal forms, the last a proper name.

"Twenty years before Campanari's find, Grotefend had discovered the true Etruscan numerals, which are in the main the same as in Latin. I give the following preliminary list:—

- | | |
|-------------------------|---------------------------|
| 1. <i>Eka</i> , Un-i. | 8. <i>Uhtav-o</i> . |
| 2. <i>Tei-s</i> . | 9. <i>Nu-na-s</i> . |
| 3. <i>Tri-na-ch-o</i> . | 10. <i>Tes-n-s</i> . |
| 4. <i>Chvar-thy</i> . | <i>Tecu-m-n-al</i> . |
| 5. <i>Cvin-te</i> . | 11. <i>Tes-ne-eca</i> . |
| 6. <i>Ses-th-s</i> . | 12. <i>Tes-n-s teis</i> . |
| 7. <i>Situ-me</i> . | |

The real inscription on the dice I read as follows:—

Mach thuzal huth ci sa.

Magus donarium hoc cisorio fecit.

Mach is nom. sing., shortened form of *Mach-u-s*, like *Ruma-ch* = *Romanus*, from *Ruma-chu-s*, *fruntee* from *frunta-cu-s*. The same stem occurs in Lat. *Mag-u-s* and *Mac-s-tr-na* = Lat. *Ma-s-tar-na*, cognate with Lat. *mag-is-ter*.

Thu-z-al is acc. sing. neuter, stem *thu-z-ali*, assimilated form of *thu-ti-ali*, corresponding to a Latin *do-ti-ali*, from *thu-ti*, i.e. Lat. *do-ti*, Gr. *δω-τι*, gift.

Huth, acc. sing. neuter = Lat. *hoc*.

Ci-s-ā, 3 pers. sing. ind. pres. act., for *ci-s-ā-t*, with final *t* lost, as usual. The root is the same as Lat. *card-ere*, *incid-ere*, *lap-scid-ius*, engraver.

The dice were an offering, and, like other votive offerings, never intended for practical use.

AMONG the numerous vegetable remains which represent the flora of the coal measures, some of the most interesting are those bodies which are generally known as fossil fruits. Perhaps the most common of these fossils is the *Trigonocarpum*, which was generally regarded as the fruit of a palm until Dr. Hooker pointed out its relations to the conifers. Some remarkable fossils of a similar character, from the coal basin of St. Etienne in France, have been recently described by M. Adolphe Brongniart. They appear to represent the naked seeds of plants allied to the cycads and conifers; hence they are strictly described, not as fossil fruits, but as *graines fossiles*. They occur, in a silicified condition, in the pebbles of a conglomerate in the coal measures, where they were discovered by M. Grand'Eury. All the seeds are orthotropous, the testa of each presenting a hilum and a chalaza at the base, and a micropyle at the opposite extremity; the structure of the nucleus cannot be well studied, since its tissues have been altered by silicification, and the internal cavities are studded with crystals of quartz, like true geodes. Although the general structure of the seed resembles that of existing gymnosperms, yet many of the fossils present characters which clearly separate them from existing genera; indeed, M. Brongniart's studies have led to the recognition of as many as seventeen genera and twenty-four species from this single locality. The technical characters of these genera and species have been given by the author in a memoir presented to the Academy of Sciences of Paris.

It was by no means an easy task that Mr. Judd set before him in attempting to work out the geological history of the Secondary rocks of Scotland, scattered as they are in isolated masses amid the older formations. In the second part of Mr. Judd's memoir on this subject, which has recently been published by the Geological Society, the author discusses the mutual relations of the secondary and volcanic rocks of the western coast of Scotland. The mesozoic period was both preceded and followed by violent volcanic disturbances. Probably the first period of activity

extended from the time of the Old Red Sandstone down to the close of the Palaeozoic era, and the second period appears to have lasted throughout Tertiary times—felspathic or acid rocks having been erupted from the Eocene volcanoes, and augitic or basic rocks from those of Miocene age. The distribution of these volcanic rocks in the Isle of Mull is clearly shown by a coloured sketch-map accompanying the paper. The continuation of Mr. Judd's researches will be looked for with much interest by all who are occupied with the study of Scottish geology.

In a paper entitled "Des Stations Celtiques au point de vue Géologique," M. Eugène Robert connects the distribution of these early stations with the geological features of the country. A supply of flint was of all things most necessary to the old stone-using folk, and consequently it was by no means a matter of indifference whether they settled in this district or in that. In France flints are very common, both in the chalk and in certain fresh-water limestones; but those from the latter rocks are the better fitted for tool-making. Rolled flint pebbles are excessively common, but these are generally too brittle, although in some cases they have been largely employed.

EAST ANGLIA offers peculiar attraction to the student of British geology, since some of the Upper Tertiaries are limited to this area. The county of Suffolk is specially favoured in this respect, for the richly fossiliferous beds known as the Coralline and Red Craggs are scarcely to be found beyond the limits of the county. Mr. J. E. Taylor, the Curator of the Ipswich Museum, has written an excellent sketch of the geology of Suffolk, which has been reprinted from White's *County History and Gazetteer*. The writer concisely describes the several formations from the chalk upwards, giving special prominence to the crags and the series of glacial deposits. Peculiar facilities are afforded for studying the Suffolk crags in the numerous pits which have been opened for working the phosphatic nodules, so largely used in the manufacture of mineral manures.

In 1865 a volume was issued by the Geological Survey of Canada, containing descriptions of new Silurian fossils by Mr. Billings, the palaeontologist of the survey. The first part of a new volume of this work has just appeared. Mr. Billings here describes a large number of new species from palaeozoic rocks in various parts of the Dominion, including the Silurian and Devonian rocks of Gaspé, the "primordial rocks" of Newfoundland, and the Upper Silurians of Arisaig, in Nova Scotia.

A SPLENDID example of the aid which the microscope may afford to the student of petrology is furnished by Dr. Möhl's memoir on the Basalts and Phonolites of Saxony, published in the Dresden *Nova Acta*. Nearly six hundred sections have been prepared for this memoir, but the author tells us that he has cut and studied, altogether, no fewer than five thousand sections of the tertiary and younger eruptive rocks. In the present essay the mineralogical characters of a large number of Saxon basalts are minutely described, while the more important preparations are figured in some excellent chromo-lithographed plates which accompany the memoir.

SOME notes on the occurrence of ores of mercury in several localities in Carinthia and Carniola have been contributed by Bergdirector von Lipold to the Austrian *Zeitschrift für Bergwesen*.

A PAPER on the zeolitic minerals which occur in the cavities of a vesicular basalt quarried near Buchholz, east of the Siebengebirge, has been published in Leonhard and Geinitz's *Jahrbuch*. In this paper Professor A. Streng describes the crystallographic and chemical characters of phillipsite, apophyllite, faujasite, and gismondine.

SOME time ago Dr. von Stache, of Vienna, published the first part of his researches in the palaeo-

zoic rocks of the Alps, and having since continued his studies in this area, he has lately published a second paper in the *Jahrbuch d. k.k. Geolog. Reichsanstalt*. This elaborate memoir is devoted to an examination of the older rocks of the Eastern Alps. The *Reichsanstalt* has also recently issued two fine monographs—one on the palaeozoic rocks and fossils of Podolia, by Dr. von Alth; and the other on the triassic genera *Daonella* and *Halobia*, by Dr. von Mojsvar.

M. LECONTE, referring to the utilisation of water power in the compressed air-engines employed in making the Mont Cenis tunnel, proposes to make the tidal movements available for a similar purpose in excavating the projected tunnel under the Dover Straits.

A REUTER's telegram states that, it has been decided to establish a museum in Madrid for objects coming from Spanish colonies.

A MONUMENT to Albert von Graefe, the oculist, is shortly to be unveiled at Berlin. It is situated in the middle of a garden, facing the principal entrance to the Charité.

THE question of cremation or inhumation, which has long been a puzzle to those interested in the ancient cemeteries of Etruria, as at Villanova and Poggio Renzo, will be placed in an entirely new light if the theory can be made good which M. Bertrande, on the part of Count Conestabile, its originator, announces in the September number of the *Revue Archéologique*, pp. 155-7. Details are promised at an early date. For the present we are told that the Etruscans proper followed only the process of inhumation, and that the tombs where evidence of cremation has been found belonged to a native population, towards which the Tusci stood in the relation of conquerors and of an aristocracy. This native population would adhere for a time to its primitive custom, and this would account for the presence of the two methods of burial side by side in the same cemeteries. Count Conestabile has earned a splendid reputation by his services to Etruscan archaeology, and, therefore, while waiting for his explanation, it is only right that we should anticipate a solid foundation for his theory.

FINE ART.

PRIVATE COLLECTIONS OF ANCIENT SCULPTURE.

It is curious to observe how the rapid growth of National Museums in the principal countries of Europe has affected the passion with which our nobility and others of station and means had been wont to collect about them works of Greek and Roman art. So far as sculpture is concerned, that passion has practically died out, owing partly to the keenness of competition, but more perhaps to the shade which is cast on all enterprise of the kind by the absorbing interest of national collections. It is small credit to be the possessor of a gallery of ancient sculptures in this country now, when the mind at first thought of such a subject turns always to the British Museum. But while it is true that the collection of that institution represents the finest treasures of ancient sculpture which have been brought to this country, and safe to assume that for the future no private competitor will distance it in the acquisition of any object of monumental importance, there remain these two facts, that many private collections—some of them formed when the Museum as yet was not—still exist in scattered places of this country, and that these collections are, for the purposes of study, unknown. Of the general interest which they excite it may be judged, when we say that it has been left to Professor Michaelis, of Strassburg, to make a catalogue of them—not for our wants, but for the wants of students in Germany. If this neglect were likely to have weight in inducing the owners of these treasures to offer them to the Museum at their

proper value, it might be defended on principle. But such a prospect is hardly to be encouraged. Meantime we may as well know what really exists, and for this purpose the catalogue just mentioned—it will appear in the forthcoming number of the *Archäologische Zeitung* of Berlin—will be invaluable. It does not, however, pretend to be complete, one object in publishing it having been to show the number and importance of the specimens of sculpture in comparatively known collections, and so to draw out information, first, about collections, if any, which may have escaped notice; and, secondly, about certain sculptures which are known to have been in this country once, but are not now discoverable. Omitted from the catalogue are, further, all sepulchral bas-reliefs and sculptured sarcophagi, which are reserved for separate publication at the instance of the Roman Institute—the former by Professors Couze and Michaelis, the latter by Professor Matz.

Preliminary to his catalogue, Professor Michaelis gives a sketch of the formation of the chief English collections, which, while it cannot be read without sometimes suggesting the overpowering influence of fashion, yet in the main is calculated to leave feelings of pride at the unconquerable zeal with which for about two centuries the ancient world was ransacked to furnish the galleries of our men of note. It was not till a comparatively late period that the passion took root in this country, owing, perhaps more to political than to geographical isolation. It began with Thomas Howard, Earl of Arundel (1585-1646), "to whose liberal charge and magnificence," says Peacham, an admiring contemporary, "this angle of the world owed the first sight of Greek and Roman statues, with whose admired presence he began to honour the gardens and galleries at Arundel House about twenty years ago, and hath ever since continued to transplant old Greece into England." The pursuit was now taken up by Charles I. and the Duke of Buckingham, with an activity which may be partly estimated from the fact that the sale of the King's collection, numbering 450 specimens, realised 16,000*l*. The search for such objects was no longer confined to Italy: the fleet in the Mediterranean, the ambassador at the Porte, and private agents in Greece and Asia Minor being looked to for a constant supply of new specimens of sculpture and inscriptions. Unscrupulousness seems to have been the first merit of an agent in this matter, and accordingly we have some fine tales of their exploits, as, for instance, when Petty, the agent of the Earl of Arundel, obtained for his master, among other things, the famous Parian Chronicle, by contriving that its former owner, a certain luckless Mr. Sampson, should at the right moment be conveyed to prison in Smyrna (1627). Critical judgment was an accomplishment which was not insisted on. The agent's business was to obtain, fairly or not, all that came in his way, and to send it home. Nothing, however, was so genuinely welcome as portrait busts, which, with their stamp of past greatness, seldom fail to interest ambitious minds. We can easily conceive, to come to more recent times, the source of the pleasure with which Burke contemplated his imperial Roman busts. But our collectors have not always been men of this mould. At times, indeed, they have been men—as in the case of Dr. Mead, physician to George II., and in large practice—fully occupied with duties between which and this pursuit there appears to be no rational connexion. Towards the end of last century, the rapacious agents of former times were succeeded by men who, like Gavin Hamilton, had nothing at heart but the interests of ancient sculpture, or, like Jenkins and Byres, who, if dealers by business, had yet excellent taste. The scene of their activity was Rome and its neighbourhood. The Roman villas and palaces full of ancient sculptures opened their doors to the auctioneer freely, and not content with this, Hamilton obtained

leave to excavate numerous ancient sites near Rome, and carried on his work with unparalleled success. Naturally, most of the figures so found were more or less mutilated, and as such, deemed unfit for the market until they had been subjected to the vilest process of restoration. Take, for example, what Nollekens says in the following passage from his life:—

"Why, do you know, I got all the first and best of my money by putting antiques together. Hamilton and I and Jenkins generally used to go shares in what we bought; and as I had to match the pieces as well as I could and clean 'em, I had the best part of the profits. Gavin Hamilton was a good fellow, but as for Jenkins, he followed the trade of supplying the foreign visitors with intaglios and cameos made by his own people that he kept in a part of the ruins of the Coliseum fitted up for 'em to work in slyly by themselves. I saw 'em at work though, and Jenkins gave a whole handful of 'em to me to say nothing about the matter to anybody else but myself. Bless your heart! he sold 'em as fast as they made 'em."

Among the principal purchasers in this quarter were Charles Townley, whose collection is in the British Museum; Henry Blundell, of Ince, near Liverpool; and the Marquis of Lansdowne. There were many others less conspicuous, as the halls of England testify. But again the desires of collectors turned to Greece itself under the influence of the Dilettanti Society, of travellers like Sir Richard Worsley and Clarke of Cambridge, but especially after Lord Elgin had obtained for his treasures a resting-place in the British Museum. For a time the rooted liking for pretty specimens of Græco-Roman art, which found a powerful defender in Payne Knight, offered stubborn resistance, but the tide was too strong for him in the end.

So far we have touched only on a very few of the points raised by the introduction prefixed by Professor Michaelis to his catalogue. For the rest, we must refer to the *Archäologische Zeitung*; and we would conclude by suggesting that we should now ask ourselves whether it is wiser, as we seem to be doing, to wait for some possibly very distant day when these private collections will become public and easily accessible property, or at once to take all the advantages that are offered to become acquainted with them.

A. S. MURRAY.

NOTES AND NEWS.

SIR RICHARD WALLACE has offered to the Grand Chancellor of the Legion of Honour, for the decoration of the great salon of the Palace, a magnificent *garniture de cheminée*, formerly the property of Marshal Davoust, to whom it was given by Napoleon I. To this he has added some fine vases and candelabras of bronze gilt, from Malmaison, where they ornamented the *cabinet de travail* of Napoleon, then First Consul, who was the founder of the Order.

SOME valuable paintings have perished, writes the *Précurseur*, of Antwerp, in consequence of a fire at a coachmaker's, over which was the workshop of Van der Haeghen, a picture liner, who had at the time several important pictures confided to him, among which were two large pieces of Rubens, one representing the *Triumph of Love*, the other, *Children at Play*, encircled by wreaths of fruit in Snyder's best manner. Also, the *Last Supper*, by Cornelis de Wael, the younger, belonging to the church of St. James, at Antwerp. But the greatest loss caused by the fire is, considering the rarity of works of this painter, the masterpiece of Wenceslaus Roeberger, representing the *Martyrdom of St. Sebastian*, ordered by the brotherhood of that name to ornament the chapel of St. Sebastian, in the cathedral of Antwerp. The painting disappeared, with many others, at the time of the French invasion, and after passing through several hands, was purchased in 1833 by M. Verlinden, an amateur of pictures at Antwerp, who had given it to Van der Haeghen for some necessary repairs to the framework.

At a recent sitting of the Academy of Inscriptions, M. Adrien de Longpérier read a letter he had received from M. de Villefosse, at Constantine, accompanied by photographs of a terra-cotta mask, painted red, discovered in the tanks of Malquâ, at Carthage. The colour scales easily, and in places where it has been removed, shows the thickness of the mask. The hair, which falls back in long plaits down the neck, is, as well as the eyebrows, painted black. The ears are each pierced with six holes, three above and three below, probably to suspend earrings or other ornaments. Round the mask are seven holes much larger, three on the upper part of the head, with one above and another below each ear. These were probably used to fix the mask. M. de Villefosse inclines to consider it a funeral mask, but M. de Longpérier refutes the idea, on account of its small size, insufficient to cover the face. This is the first specimen, he says, of an object in full relief (*de ronde bosse*) of Carthaginian art, offering all the characteristics of Phœnician art. The same red colour of the face exists on figures on the great tomb of Caere, and also in another sculpture of Asiatic work, a head painted red, with black hair, brought from Edessa, and both now in the Louvre. If, therefore, we compare this mask with the terra-cottas of Phœnicia, we recognise an analogy, a similitude of workmanship which warrants our attributing to the works of stone, marble, and bronze found in Carthage the style of the Semitic monuments left to us of the same material.

THE municipality of Nîmes have decided upon erecting a statue of M. Guizot in one of the gardens of the new museum.

A MOST valuable discovery has been lately made at Herculaneum—that of a female bust, life-size, of pure silver, in admirable preservation. What is curious is, that at first it was thought to be only of bronze, of which metal so many are found at Herculaneum and Pompeii. The scorise charged with sulphur, with which it was surrounded, have superficially altered the precious metal of this work of art, and the sulphuret of silver which has formed on its surface gives it the appearance of a black figure of ordinary metal. It was only when it was taken to the museum that one of the keepers, struck by its colour, which differed so greatly from that of the bronzes, thought of scratching the surface, when the silver reappeared in all its brilliancy. This superb work of art is the only one of its kind that has been yet discovered in the buried cities. It weighs rather more than 42 lb.

ONE hundred cartoons by Schwind, Schnorr, Kaulbach, and others, the original drawings to many beautiful church windows executed at the Royal Institution for Glass-painting (Königliche Glasmalerei) in Munich, will shortly arrive in London. These cartoons are the property of Herren Merkel and Bachmaier, the directors of the Munich Gallery, who intend to exhibit them at the Crystal Palace, as no other place large enough for them can be found.

WE have very good authority for stating that there need be no serious apprehension of a refusal on the part of the Greek Chamber to ratify the convention entered into between the Government and the Prussians for the excavation of Olympia.

THE new Paris Synagogue (opened on the 9th of last month) in the Rue de la Victoire is exciting considerable attention by the peculiarity of its external architecture, and the dimensions and gorgeous character of the interior. In style it is mixed Byzantine and Moorish, and it is to be regretted that the narrowness of the street in which it stands, and the generally unfavourable nature of the site, mar the imposing character of the building, and prevent it from being seen to advantage. The main aisle, which is twice as broad and nearly as lofty as that of Notre Dame, forms a suitable approach to the noble "Théba," or high altar, from which the scriptures are read, and on

which stands a seven-armed massive silver candelabrum six feet high, which is in itself a most admirable work of art, and, like the marble columns and other decorative portions of the building, the gift of private individuals. From its originality and simple grandeur, the design reflects honour on the architect, M. Aldrophe.

IN the numismatic cabinet of the Royal Mint at Rome, bronze copies are sold of the great medal commemorative of Rome becoming the capital of Italy.

Two exhibitions have recently been held in Boston which, although not of much importance in themselves, may possibly point to significant results in the future. Education in drawing has for some time past been made compulsory in America, and public Art Schools have been established by the State; moreover, every town of more than 10,000 inhabitants is now bound to support an evening school of art for the instruction of adults. It is the works of the pupils in these schools—the public Art schools and the normal Art schools of Massachusetts—that form the exhibitions in question: crude works enough, no doubt, but interesting as showing the fruits of a mode of instruction differing in many respects from that usually pursued in the Art schools of other countries. The chief features in the American mode of teaching are: drawing from memory, drawing from dictation, and original composition, which is permitted at a much earlier period than in our English Art schools. Drawing from memory is easy to understand. It accustoms the pupil to observe the forms of things and fix them in the mind. Drawing from dictation needs more explanation. The teacher stands before his class without any kind of paper, slate, or board on which to execute a drawing. He simply *dictates* the subject to be drawn, line by line, point by point, and, as the pupils do not know beforehand what the final result of these lines, &c., will be, their attention and interest are excited far more than if a model were placed before them to copy. Of course such practice can only be of use for conventional subjects that have certain definite proportions, more especially geometrical figures, but one can well understand that the following such dictation must rouse the powers of attention in the pupils and produce a certain quickness of comprehension and expression.

That it does in fact do so is warmly asserted by a Boston correspondent of the *Beiblatt zur Zeitschrift für Bildende Kunst*, from whose letter on the subject we have gained much information. In the exhibition of the pupils of the public schools, it is astonishing, he says, to note the firmness of hand in drawings of children of eight and nine years old, and the understanding evinced of conventional ornament. America has, it is true, not as yet revealed any remarkable artistic genius, but who knows but that the art of the future may belong to her, instead of to France which so confidently claims it; at all events it is evident that she is doing her best to foster in her children a love and a knowledge of art that cannot fail to lead to useful if not great results.

The rapidity with which works of art are executed in America is another remarkable fact. If life is as short there, art, at all events does not seem to be so long as on this side of the Atlantic. American painters think nothing of covering miles of canvas in an incredibly short space of time, and it would seem that it only requires six months' study of art to be able to set up as a teacher. In a review of one of the exhibitions above mentioned, namely, that of the normal Art schools of Massachusetts, an American paper states that most of the candidates for the position of teacher had executed the series of twenty-four drawings required of them as a test of their powers within the space of six months, and that one among the candidates absolutely knew nothing of drawing before that time! One would infer from this that the knowledge required for the profession of art-teacher in America was not very profound, but,

on the other hand, we find that these twenty-four drawings must exhibit a knowledge of drawing in most of its branches, and that the candidates are required to pass in drawing from set copies, shaded drawing from models, perspective construction, shadow construction, perspective drawing from nature, botanic analysis to aid in the composition of ornament, history of ornament, applied ornament, architectural drawing, machine drawing, construction of building, water-colour painting, &c.—altogether a formidable amount of knowledge, that no one but an American would suppose it possible to attain in a space of six months. It is not said whether this prodigy of an art-scholar passed, only that he sent in his twenty-four drawings for exhibition with the other candidates.

THE *Observateur d'Avesnes* mentions the recent discovery, on the site of the old Porte de France, at Avesnes, of a little cannon, which, to judge from its form, belongs to the fifteenth century. It therefore probably served in the defence of that town in 1477. Two curious coins were found at the same time and place: one a silver piece, of Louis de Bourbon, Bishop of Liège, brother of Charles the Bold—the bishop whose assassination by Guillaume de la Marck was used by Scott as an incident of *Quentin Durward*; the other, a gold piece, of Jean de Hornes, provost of Saint-Lambert, elected Bishop of Liège in 1484. He died in 1505.

M. WINCKLER, architect at Strassburg, has lately discovered a *reliquaire* which doubtless was formerly placed behind the high altar of the church of Marsal. It is in stone of Tonnerre, extremely richly carved, and is supposed to be early fifteenth century work—work, that is, of a period when many of the sculptures at Rheims were executed, and some of these sculptures it appears to imitate. This old church of Marsal possesses a clock, of the early part of the sixteenth century, which bears this inscription:—

Zu Marcel gnaodich bin ich

Maister Conrat von Vich gos mich.

(Anno 1518).

Je suis à Marcel par la grace de Dieu,

Maitre Conrad de Vic m'a fondue en ce lieu.

THE STAGE.

THE ACTING IN "TWO ROSES."

THE revival of *Two Roses*—especially in the absence of the man of genius who played its principal part—was an audacious experiment by the managers of the Vaudeville, but an experiment that has proved entirely successful. Not only do we, now that after a three years' interval the piece receives a second setting, the more easily persuade ourselves of its permanent merits; but we see in its present performance an excellence rarely attained. The piece was acted capitally at first; so well that though some merits of its own lay on the surface, it was not certain how much merit lay beneath, nor how large a measure of its success was due to its interpreters, and inseparable from their own personality. But now a second company—for only Mr. Thorne remains, to repeat his representation of the blind man, Caleb Deecie—has taken it up, and on the whole with even greater success, and it has obtained this success by a representation wholly independent of and often wholly unlike anything that has gone before. No one can see *Two Roses* played by this second and very different cast, without discerning that the comedy has something more than a passing strength. It is built out of wit and feeling and close observation. As literary work it reflects a bit of English society with the accuracy with which the work of M. Émile Augier reflects a wider and more important society in France; and the author, while leaving traditional for natural sources of humour, keeps the play natural without making it trivial, so that the fun is other than that which has been found in a miscarried milk-

jug, and the sentiment other than that which clusters round a swing in a playground.

Of course there are two or three things in the treatment of the subject to which one may reasonably take exception. The character of "Our Mr. Jenkins," the commercial traveller who is always relieving a well-born family now fallen and poor, is newer in its conception than in its treatment; and, while true enough in the first act, this good fellow becomes distinctly farcical in the third. When he remarks, with momentary piety, that he has "put off the Old Man," it is capital for Caleb Deecie to ask, "What! had you an appointment with him?"—and Mr. Thorne asks this with so much solicitude that you feel his own anxiety that the appointment, even if it be with the "Old Man," shall be punctually kept. But some of the allusions—that to "the tents of Shem" for instance—are entirely forced. The merry bagman would never have caught up this pious slang as rapidly as Mr. Alberty fancies. And the bit of stage-business with the croquet-mallet, when "R is a rook, with a sanctified look," gains only one of the untimely laughs condemned by that soundest of theatrical critics—Hamlet, when he is advising the players. Again, in the character of Lottie—not so clearly conceived, by the bye, as that of Ida—there are one or two points which make it difficult to play the part with entire consistency. The words in the last act, which describe her childish attempt to make her rose grow like her sister's, would have done very well for the first act, but are only a difficulty in the place where they occur, for during the lapse of eighteen months the girl's character has obviously grown. A great love and a long illness have not come to leave no sign.

And in bringing into new prominence the greatness of the love, Miss Amy Roselle is after all quite right. It entails a little difficulty—the childishness, which was natural in the beginning, having become unnatural to this love in the end. But it accords with the strength of Jack Wyatt's own care for the girl; and moreover, it accords with the main action of the heroine throughout the piece—with her solicitude, her forethought for Wyatt in his illness; with her own illness afterwards; and with the words, which, spoken at the end of the play, echo the promise made at its beginning. The child's seriousness of Miss Fawsitt's Lottie, in making this promise, had a charm and touch of pathos in it, but it is Miss Roselle's Lottie that remembers the promise best;—or rather, this new Lottie improves upon the promise, for her feeling grows gradually stronger to the end. One thing, however, she does badly—the little realistic bit of business over the lover's smoky pipe. Too much is made of it; it is too long drawn; too much emphasised. I remember Miss Fawsitt disposed of this business with a touch. One natural gesture, and the thing was past. But in the main Miss Roselle loses nothing of the bright side of the character. And from a very graceful humour, in the Kentish parlour scene, she rises to genuine intensity of feeling in the second act; intensity of feeling which would indeed be unfitted for drawing-room comedy if it sought or found any melodramatic, any over-wrought, expression; but the merit of it is, that it is not only very strong, but very quiet too. There may be nothing perhaps in Miss Roselle's performance to take our public by storm, but the more closely we have watched the best French acting—the art which considers the *ensemble* as well as the individual; and knows where to stop as well as where to begin—the more shall we be satisfied with this acting of hers. For Miss Roselle is particularly admirable in incidental moments: in fleeting expressions which the bare words of the piece have done nothing to prompt. She is generally best where acting is really most difficult; that is, where the author has done least for the artist, and where the spectator is naturally least expectant of effect.

Mr. Farren, who now, in place of Mr. Irving, is

Digby Grant, has given us many picturesque performances: none better than that of the old city merchant in Holcroft's *Road to Ruin*. His present performance is full of discretion and carefulness: perhaps it is not as clearly individual as some others of his, though I am not sure that it is less true; for here, indeed, Mr. Farren's Grant is not the visible humbug that Mr. Irving made him. With Mr. Farren, it is conceivable that the heroine should still believe in her father—a point throughout insisted on—while with Mr. Irving this was only conceivable on the supposition that the heroine was a fool. While, therefore, it may be thought that Mr. Irving's performance was the more salient and the more immediately effective, it will be allowed that Mr. Farren's is thoroughly studied, and that it is full of points to which much meaning is given. The new Digby Grant is a calmer man than the old. He is surer of his purposes, if he is less ingenious in reaching them. He is master of his means from the beginning, for his nerves are no longer shattered, and nothing annoys him very much.

The Jack Wyatt of Mr. Charles Warner is a manly fellow, who allows himself to be rather more wretched than his predecessor on account of separation from his love. It is quite in vain that he persuades himself that it is pleasant to be a bachelor—even the misery of Mr. Jenkins with his wife is not an appreciable comfort to him, and he fairly breaks down at least once. But yet he half despises himself for his despair, and is a very workaday young fellow, after all: less fascinating, they tell me, than Mr. Montagu was; but then you give him your undivided attention, and while commiserating his misfortunes you are not distracted by the anxious consideration as to whether his coat is the result of the art of Maddox Street or the art of Savile Row. Mr. Thorne's Caleb Deecie is an accurate study of the particularly hopeful and cheery character of this one blind man, and not so much, as has been said, a study of the characteristics of many. There is often a high calm about the blind, and this Caleb Deecie hasn't got. But he is devoted to his friend—he takes his blindness very much as a matter of fact, that has no romance in it, and so is rightly enough no pendant at all to the Nydia of Lord Lytton's story. He has no raptures, but little dissatisfaction. He accepts to-day, and takes no thought for the morrow, and is chiefly occupied with his next step but one. Mr. David James by his representation of the generous bagman has added to the list of good performances of comedy which succeeds to the earlier list of amusing performances in burlesque. His present representation, being entirely comic, does not give him the opportunity of displaying any new power which was afforded by the more mixed representation of the country brother Coke in *Old Heads and Young Hearts*; but it is genuinely funny from the first to the last, and true to life into the bargain. Miss Larkin is ecstatic in her reminiscences of the oratory of Exeter Hall; and Miss Kate Bishop, as the sister of Lottie, acts better than she has acted before. There is more of vigour in her performance, along with the intelligence that keeps her natural.

There is a lawyer in the piece—one Mr. Furnival—and he is played this time by Mr. Edward Righton. Fancy a puffy indomitable man, entirely good natured—the sort of lawyer who heals a quarrel instead of making it worse. He belongs, you may be sure, to a very good club, and though full of business contrives to get his rubber there, and his chat. He is just as sorry for other people's misfortunes as a considerate surgeon is for other people's maladies—just as sorry and no more. He is invariably cheery and continually energetic. His mind is ten years younger than his body, for he has been seized in middle age with some complaint or other in his back—I think it is rheumatism, but it may be lumbago, or even a more deeply seated malady—which gives him a peculiar and an awkward walk. His life is not very good for an in-

surance company, but he will keep on his legs to the end; and will drop down suddenly some dozen years to come, during office hours, in a passage between Gray's Inn and Ely Place. That is the gentleman Mr. Righton represents, with a completeness so absolute that you expect to meet him in the street, and find it difficult to connect him only with the stage of a theatre. The portrait is of such uncommon excellence that by it Mr. Righton has made a jump into the front rank of his profession.

So much to praise! and yet one has been looking for points to blame. But the truth is, that the playgoer may witness—at the Vaudeville—a performance of well-nigh unbroken excellence by a little society of artists. Coming back from moors and coast, he may enjoy it as a boy enjoys a pantomime. For many a year there has been no better thing. All the town should go to see it.

FREDERICK WEDMORE.

THE NEW PIECE AT THE STRAND.

SINCE the curtain dropped for the first time on *Nemesis*, Mr. H. B. Farnie, the author of that *bouffonnerie*, has been a favourite with those who relish a laugh after dinner. Although his next Strand burlesque, *Eldorado*, was rather disappointing, Mr. Farnie has now, with the *bouffonnerie musicale* of *Loo, or the Party who Took Miss*, produced last Monday at the above-named theatre, again hit the mark. The plot—and there are, by the way, not many pieces of that character where such a thing is to be met with—presents the following incidents. Tabardon (Mr. Harry Cox), a retired notary, now wine grower, intends to marry his only daughter Louisa (Miss Lottie Venn) on commercial principles, and has taken into his house a round dozen of suitors, all young vine growers, for a twelve-month's trial. The most stupid of them, Emilion (Mr. Terry), of course wins the father's favour, very much to the discomfort of Louisa (Miss Lottie Venn), whose heart has been touched by the cracked *uts-de-poitrine* of Fiasco di Gamut (Mr. H. St. Maur), the tenor of a travelling opera-bouffe company. The scene opens on the eve of the day on which Louisa is to be united with Emilion, and we find the two lovers, as well as the rejected suitors, in great despair. The tenor confesses his sorrow to Bagatelle, the prima donna of his troupe (Miss Angelina Claude), who promises help. Two ladies of the travelling opera-bouffe troupe in disguise induce Tabardon—who thinks himself still *un homme à bonnes fortunes*—to come to a fair lady who is expecting him at the Café du Théâtre in Bordeaux, and by the same means "lead astray" Emilion. Their plans, of course, are successful, and we see in the third scene Louisa married to the tenor, and Bagatelle to Rimbambo, the last Prince of the Abruzzi (M. Marius), who bequeaths his estates in the Abruzzi to Bagatelle, annulling the bequest at the same time in a codicil. This light canvas Mr. Farnie has filled up with much humour, many very funny scenes, so that the audience laughs from the beginning to the end—except, indeed, in the rather slow third scene, which will gain by being shortened. Miss Angelina Claude has the most prominent part. Those whom Miss Claude disappointed in *Eldorado*, after her great success in *Nemesis*, will be pleased to restore her to their favour by her cleverness in this. Miss Lottie Venn fills the secondary part of Louisa, Mr. Harry Cox is funny, and Mr. Terry's humour is excellent. M. Marius is as amusing as he was in *Nemesis*, and this is quite enough. Mr. H. St. Maur, who plays Fiasco, is stiffer than ever real tenors are upon their own stage, but some minor characters are well filled by Mr. H. Carter, Miss Kate Philippe, and Miss La Feuillade. The music is cleverly arranged by Mr. John Fitzgerald, and Mr. Hall has painted some pretty scenes. At the end of the burlesque Mr.

Farnie was called for, but the stage-manager, Mr. C. H. Stephenson, appeared before the curtain for him, "Mr. Farnie being absent and supposed to be in Brighton." Some of the honours bestowed upon the absent gentleman for whom Mr. Stephenson appeared were due to the stage-manager himself. Mr. Farnie was fortunate enough to come back from Brighton directly after his absence was announced—in time, in fact, to shake hands with a few critical friends. SIGMUND MENKES.

NOTES AND NEWS.

THEY produced Mr. Halliday's adaptation of the *Talisman* at Drury Lane, on Saturday. A correspondent was able to give us, in our last number, some account of the way in which the adapter has dealt with the original work. The way has been found satisfactory by a Drury Lane audience, and the fact that it has been so found answers, as we conceive, more than one of the objections that might possibly be made to it. Mr. Halliday has been perhaps too often condemned because his work has not the eloquence of poetry and because it does not sparkle with unnumbered epigrams. Did he ever intend it to? You must judge a work surely, in some measure, by the standard which the author proposes to himself. Well, Mr. Halliday has, among other things, proposed to popularise in the fullest sense, on the boards of the theatre, the work of two men of genius who were novel-writers—the greatest England and Scotland have produced. In the main, he has succeeded in his task. No doubt he has found it profitable; and, considered practically, we cannot see that it has been unworthy. What if, in the case of adaptations from Sir Walter, pageantry has counted for much?—a vast theatre is made in part for pageantry. This particular adaptation now being performed at Drury Lane is, it is true, in some respects a less considerable and successful performance than some others. Really too much room is allowed for revels which look very like a Christmas pantomime; all this breaks in too much, it seems, upon the interest of the story. But after all, Mr. Halliday has found his British public, and not made it. Moreover, the piece affords to several popular actors the kind of parts that are suited to them. Messrs. Terriss and Creswick and Miss Wallis enact some of the principal characters, and appear to be the performers who acquit themselves the best.

Faded Flowers—the little work of Mr. Arthur A'Becket—produced at the Haymarket by Mdlle. Beatrice's company a few nights ago, would be worthy of some notice, even were it only because it is one of the very few attempts ever made to seriously interest us in a story that is told in a single act. But some of the details of the little story are ingenious, and much of the language is nervous and good. The main fault appears to be the improbability at the root, not so much of the subject as of the general treatment—the wife, brought face to face with the old lover, could hardly fail to recognise him. She does not see him for a minute only. She talks to him much, and confides in him, and believes all along that he is her old lover's friend. By voice, by manner, if not by face, she would surely have recognised him. But if we forget for a moment this chief improbability, the piece is an interesting one. It wants more finished acting to give it reality. Mr. Frank Harvey, who plays the principal part—that of the lover who has come back to find his sweetheart married to his friend—is extremely unequal; a judgment, which it must be recollected is half praise. Miss Edwards acts the wife with ease and pleasantness, but without subtlety or real force. As the husband, Mr. Gayton is by no means to be commended.

THE Lyceum opened its doors on Monday for its regular season under the management of Mr. Bateman. The main piece enacted was *The Bells*, which will perhaps continue to be performed till

the production of *Hamlet*. The best part of the public knows already that while it is a most effective drama, it does not afford to Mr. Irving his best character. An actress, with a merry wit, said lately that it reminded her of the *Dumb Man of Manchester*, and when asked what was the *Dumb Man of Manchester*, explained that it was a sensational piece of the utmost wildness, in which all the characters were murdered; that it was played by the pantaloons sometimes for his Benefit, in country towns, when Christmas gaieties were over, and that *The Bells* was "a burlesque upon it." But that is only one way of looking at an effective drama, which, though it does not afford to Mr. Irving room for his more delicate effects and subtler suggestions, does enable him to give a representation of amazing power. *The Bells* is just now followed by the well-known farce, *Fish out of Water*, in which Mr. Compton, who is a new acquisition at the Lyceum, acts with his wonted skill.

THE Globe has opened with *East Lynne* and *Vert-Vert*—the programme we announced last week. Miss Ada Ward, who may be inclined to be melodramatic, but who has intelligence to boot, now represents the heroine. To this performance, on the whole creditably sustained, the *opéra bouffe* succeeds. In it Mr. George Barrett displays a fair share of dry humour; but it is the actresses who have the most to do. Mdlle. Camille Dubois is a very efficient actress of the kind of part she here assumes. She is assisted by Miss Marie Parselle, Miss N. Jordan, and many other young ladies—by one especially, whose name, after long and diligent (not to say exhausting) study of the play-bill we are still unable to divine; for the play-bill is rather a curiosity in its way; being so bafflingly replete with the names of numberless young persons all more or less attractive, but some of them still, alas! unknown to fame. It is an *embarras de richesses*.

MISS ISABEL BATEMAN was ill last week at Bristol, and unable to act with Mr. Irving in *Richelieu*.

THE *Love Apple* is the latest musical addition to the programme of the Gaiety. Mr. Taylor, Miss Alice Cook, and Miss Monroe (a *débutante*) have appeared in it.

THIS evening will be the first of *Giroflé-Girofla* in English. It will draw people—at all events from curiosity to begin with—to the Philharmonic Theatre.

THE reappearance of Mr. Sothorn at the Haymarket, and the beginning of the regular season there, is fixed for next Saturday.

ON Monday Mdlle. Celeste appears at the Adelphi in *Green Bushes*—evergreens themselves, yet hardly so indestructible, seemingly, as the actress who is associated with them. At this theatre during the week, the American Mr. Clarke has been giving his performance of Dr. Pangloss in *The Heir-at-Law*.

WE chronicled last week the new success of Mdlle. Delaporte in Paris, and are pleased to be able to say now, that partly in consequence of this success, the eminent actress, too long lost to France, is not likely to renew the engagement which will take her to St. Petersburg during the present month. This Russian engagement, which, with brief intermissions for holidays, such as the present, has taken up many years, approaches its conclusion; and it is with the intention of appearing more frequently in Paris that Mdlle. Delaporte hesitates to renew it.

AN actor named Martin, who performed with notable power a part about three lines long in *Monsieur Alphonse*, has had a more remarkable success in *Gilberte*. In the new comedy of MM. Gondimet and Deslandes, he pays a morning call: no one recognises him: he stays ten minutes; smiles responsively when spoken to, but never

speaks, and then retires. There is a burst of laughter all over the theatre; and it is felt that, barring just that little exaggeration which is permissible for theatrical effect, the actor has given point to the observation of a trait with which most of us are more or less familiar.

THE point of the *Ingénue*, by Meilhac and Halévy, is not a new one. It is to prove, or rather to show (for it is not much that Meilhac and Halévy trouble themselves to *prove*), that a young girl "unschooled, unpractised"—a true *ingénue*, in fine—falls far more easily into temptation than a girl who has been taught betimes that the world is not a very good place. Molière pointed a similar lesson in his character of Agnes; but then Mdlle. Chaumont couldn't act Agnes, and can very well act the *Ingénue*. And she does act it, with great point, and shocks people not a little.

THE death knell may be said to have tolled over the reputation of Favart—great for twenty years—M. Sarcy, the boldest and keenest of theatrical critics, having announced, quite tranquilly and incidentally, in the *feuilleton* which all Paris reads, "the talent of Mademoiselle Favart being now on the decline." And the actress has the hardihood still to remain upon the stage!

THE September number of the *Preussische Jahrbücher* contains the first of a series of critiques on Shakespeare's Plays by Herr Julian Schmidt. His remarks have been called forth by the recent performances at the Meininger Theatre at Berlin of *As You Like It*, which is to be the first of a series of Shakesperian representations. The directors of the theatre have ventured upon a questionable innovation in representing the piece in an entirely novel manner, altering the order and the arrangements of the scenes, on which the drop-curtain is made to fall with a hitherto unknown frequency. Some of the songs and allusions—which, however well they may have been received in the sixteenth century, are certainly no longer in harmony with the canons of our nineteenth-century taste—have been excised, and general alterations made in regard to costume and minor details, which have the effect of imparting a more decidedly realistic tone to the piece. These innovations have raised a storm of angry discussion, but the success of the experiment may be fairly assumed from the fact that, although the piece was given in the dull season, the house was well filled at every performance, while amongst the audience were an unusually large proportion of the *élite* of the literary world of Berlin.

AN HUNGARIAN adaptation of Shakspeare's *Tempest* is now being rehearsed at the National Theatre in Pesth. It is a fact that even the Hungarians see more of Shakspeare's plays performed than we do in England. No week passes without at least one or two Shakspearian comedies being named on the playbills in Pesth, and even in provincial towns. We have seen in a Russian theatre at Odessa, in one week, *Hamlet*, the *Merchant of Venice*, and *Othello*—the latter adapted from a German translation.

HOFRATH DR. DINGELSTÄDT, the Director of the Vienna Burgtheater, and one of the most prominent German Shaksperians, is staying at Scarborough, whence he will shortly return to Vienna and resume his office.

IT may be mentioned that Dr. Laube, whose departure from the Stadttheater at Vienna we noticed last week, was one of the most intimate friends of Heinrich Heine. One of the last works of the latter, *Der Rabbi von Bacherach*, is dedicated to "my dear friend Heinrich Laube." Like Heine, Laube belonged to the clique of "Das junge Deutschland." He suffered persecution and imprisonment, and had even been condemned to death. Amongst his dramatic works, *Die Karlschüler* (treating a period of Schiller's youth) and *Gruf Essex* are the best; and among his novels, *Der Deutsche Krieg* has proved the most

attractive Dr. Laube is nearly seventy years of age, and both his physical and mental powers were still those of a man of forty when we saw him last, some fourteen months ago.

MUSIC.

LIVERPOOL MUSICAL FESTIVAL.

Liverpool: September 29, 1874.

BEFORE entering into any details concerning the festival which commenced this morning, a few particulars as to the previous musical performances which have taken place in this town will probably not be without interest. As the present is announced as a "Triennial" festival, it is to be presumed that they are in future to be held regularly; but hitherto Liverpool has only occasionally been favoured with performances on a large scale. True, it possesses an excellent Philharmonic Society, under the direction of Sir Julius Benedict; but up to the present time no periodical festivals have been held here, as for example at Birmingham or Norwich.

The first musical festival at Liverpool, held, like the present, in aid of local charities, took place in the year 1784, the music given being of a miscellaneous character. Similar meetings were also held in 1790 and 1799. The next did not take place until 1823, when Sir George Smart conducted, and Miss Stephens (the present Dowager Countess of Essex), Mr. Braham and Mr. Henry Phillips were among the principal vocalists. On this occasion the music was very largely selected from Handel's works. The profits of this festival amounted to 6,000*l.* It was not until 1830 that another festival was given, again with Sir George Smart as conductor; the most noticeable features on this occasion being the performance of Spohr's *Last Judgment*—the music of which had only shortly before been introduced to the English musical public at Norwich—and the first production in Liverpool of the *Midsummer Night's Dream* overture. The last festival previous to the present one took place in 1836; and was also musically the most memorable of the series, as on that occasion Mendelssohn's *St. Paul* was heard for the first time in this country. The solo parts in the oratorio were sung by Mdme. Caradori, Mrs. Wood, Mrs. Shaw, Mr. Braham, and Mr. Phillips.

The present festival could not have been more appropriately opened than by a performance of the same grand work which Liverpool had the honour of being the first to produce in this country. *St. Paul* was first performed at the Lower Rhine Musical Festival at Düsseldorf, on May 22, 1836, under the direction of its composer, and with the greatest success. But Mendelssohn was always fastidious to a degree with regard to his own works, and he subsequently rejected or rewrote no fewer than fourteen numbers of the oratorio. The whole of the alterations were completed by October of the same year; for it was on the 7th of that month that the work was produced at Liverpool, as already mentioned; and on that occasion it was given in the shape in which we now know it.

Though less popular than the great composer's second oratio *Elijah* (a fact probably to be largely attributed to the smaller dramatic interest of the libretto), *St. Paul* is from an abstractly musical point of view in no way inferior to the later work; indeed, considered as sacred music, it is even superior. In none of Mendelssohn's sacred works is the influence of Bach so clearly discernible as here. Not only is the old Lutheran choral introduced much as we find it in the *Passion Music*, but the contrapuntal style so largely used throughout the oratorio shows a distinct reflection, though without plagiarism, of the manner of the old master. The chorus "But our God abideth in Heaven," in which the old choral "Wir glauben all' an einen Gott" is so effectively and ingeniously introduced, might have been written by Bach himself; while the more dramatic choruses, such as

"Stone him to death," or "Is this he?" are, as it were, the modernization, or "Mendelssohnization" (if one may coin such a word), of the "Crucify Him," or "Prophecy unto us, O Christ" of the *Matthew Passion*. In calling attention to these points no disparagement is intended of one of the noblest oratorios ever written; but it is always interesting to trace the influence of one master mind upon another; and in certain portions of this work such influence is plainly to be seen. On the other hand, nothing can be more individual than such choruses as "Happy and blest are they," or "See what love hath the Father," in which the strictest counterpoint is so happily united to the loveliest and most flowing melody. There is about the work as a whole a sustained breadth of style, a dignity of conception, and an artistic finish in the details of the workmanship, that entitle it to rank among the finest works of its class.

The performance this morning was in every way worthy of the music. When it is mentioned that the solo parts were in such competent hands as those of Miss Edith Wynne, Mdme. Patey, Mr. E. Lloyd, and Mr. Santley, further detail becomes almost superfluous; but it would be unjust not to make special mention of Mr. Lloyd's singing of the tenor music, as that gentleman at a very short notice replaced Mr. Sims Reeves, who was prevented by indisposition from appearing, in such a manner as to leave but little cause to regret the substitution.

The orchestra, especially in the stringed department, was admirable, and the Liverpool chorus singers performed their task with a precision, an attention to light and shade, and, above all, a fire and spirit, which were the more praiseworthy as they had yesterday two very long and fatiguing rehearsals, the results of which might have been reasonably expected to show themselves in the performance this morning. A word of special praise must also be given to Mr. Best for his tasteful management of a by no means first-class organ. Mr. Best played the organ part exactly as written by Mendelssohn himself. This part is not given in the published score of the work, but is printed separately, and is, therefore, not always heard at performances of the oratorio. So far as my memory serves me, it has only once before been given in this country—when Mr. Manns, some two years since, produced the work at the Crystal Palace. Sir Julius Benedict's reading of the oratorio, as regards the *tempi* of the different movements, was excellent, and left absolutely nothing to desire. The attendance was by no means so good as might have been wished, in spite of the attraction of the presence of the Duke of Edinburgh, who, to his credit be it said, showed his good taste, and set an excellent example to the audience, by remaining to the last note of the final chorus.

Wednesday, September 30.

My notice of the first miscellaneous concert, which took place last night, must be confined to a few of the most important items. Foremost among these should certainly be placed Mr. G. A. Macfarren's new "Festival Overture," in the key of F, which has been specially composed for the present occasion. It is difficult to pronounce any decided opinion on a work of such dimensions and so highly elaborated after a single hearing, and without having seen the music. Moreover, last night's performance suffered sadly from the unaccountable vagaries of the two trumpets—their execution of the various military flourishes, which so frequently occur in the work, affording an admirable illustration of "how not to do it." A somewhat amply developed introduction, abundant in pleasing and graceful melody, and most tastefully instrumented, leads to an allegro, the principal subject of which has a somewhat martial and decidedly festal character. The second subject, in good contrast with the first, is very elegant and flowing, with a slight tinge of Weber in it. The sub-

sequent developments of the music are both skilful and interesting, and the scoring throughout shows the hand of a master. I am inclined to consider the work one of Mr. Macfarren's most successful efforts; and the coldness with which it was received by the audience was not a little surprising. The second novelty brought forward last night was a Festal March entitled "Edinburgh," composed by Professor Oakeley, of Edinburgh University. The march is constructed on very pleasing and melodious, though not strikingly original subjects; and the instrumentation is very brilliant, but somewhat noisy, even for a "festal" march, the percussion instruments being unduly prominent. One would almost have fancied that the players on the various drums were to be paid according to the noise they made, and were bent upon earning a very liberal salary. The Duke of Edinburgh, who was again present last night, sent for Professor Oakeley at the end of the march, and complimented him upon the composition.

Passing by the performance of Mozart's symphony in G minor, which opened the concert, with the remark that it was simply perfect, and that the magnificent strings of the band were heard in it to great advantage, mention must be made of the first appearance as pianist of Miss Dora Schirmacher, a Liverpool young lady, only fourteen years of age, a student of the Leipzig Conservatorium, who played Mendelssohn's G minor concerto from memory in a manner which promises well for her future. Her touch is excellent, her execution very neat, and her "reading," especially in the slow movement, very good; by no means cold, and at the same time free from exaggeration. There is, however, a want of power about her playing, doubtless attributable to her extreme youth; and Mendelssohn's concerto requires great power of endurance, and more physical strength than can reasonably be looked for in one who is little more than a child. Miss Schirmacher has the prospect of a brilliant future before her.

The vocal music was in the hands of Mdme. Patti, Mdle. Albani, and Herr Conrad Behrens, all of whom are so well known to the London public that it is needless to say more than that the pieces selected were for the most part old favourites. Herr Strauss and Miss Schirmacher gave a cavatina by Raff, and three Hungarian dances for piano and violin by Brahms, and the overture to *Tannhäuser* concluded the concert.

The rather long concert of this morning comprised the first and second parts of Haydn's *Creation*, Gounod's new Mass, entitled "SS. Angeli Custodes," and a miscellaneous selection from Handel's oratorios. With regard to the first, named work, it will be enough to say that the solo parts were taken by Mdle. Albani, Mr. Bentham (who seems in better voice than when he sang at the Gloucester Festival), and Herr Behrens, and that both band and chorus were quite as satisfactory as yesterday.

M. Gounod's new Mass, produced last season in London, and heard this morning for the first time in Liverpool, is a very pleasing but by no means a very great work. It is on a small scale, having no "Credo," and the "Benedictus" is replaced by a setting of the "O salutaris." There is very little scientific writing, for the composer has relied for his effects more on harmonic progressions than on contrapuntal devices. The mass is less theatrical and more devotional than the "Cecilian" mass of the composer, which it resembles, nevertheless, in the gorgeousness of its orchestral colouring. The most interesting movements are the quartet, "Domine fili," sung by Miss Wynne, Mdme. Patey, Messrs. Lloyd and Behrens, and the "O salutaris," a charming chorus, which the Liverpool choir gave with excellent taste and great attention to light and shade. The least successful portions are the "Sanctus," in which the constant modulation destroys the unity of the music, and the concluding

"Communion" march for orchestra, which consists largely of a series of somewhat vague harmonic sequences, the effect of which is rendered more mysterious by the employment of the muted strings.

An enumeration of the pieces given in the selection from Handel will be all that is needful to conclude the notice of this morning's concert. The "Pastoral Symphony," from the *Messiah*, was followed by "Sound an alarm" (*Judas Maccabaeus*), capitolly sung by Mr. Lloyd, and fortunately without the abominably noisy additional accompaniments too frequently heard. Mdme. Patey and Miss Wynne sang "He shall feed his flock," the former lady taking the first, and the latter the second verse. Miss Wynne also gave "From mighty kings," and (with remarkable power) the short solo "Sing ye to the Lord," from *Israel*; and the remaining pieces were the "Hailstone" chorus, and "The horse and his rider," from *Israel*, and the "Hallelujah" from the *Messiah*.

EBENEZER PROUT.

We learn that Mr. Arthur Chappell will give the first of his annual series of Monday Popular Concerts on Monday, November 11; Herr von Bülow, the eminent pianist, will make his first appearance in London this season on the same occasion, when M. Sainton will be the first violin, and Signor Piatti play the violoncello. Herr von Bülow will be the pianist at these concerts till the end of this year; and in January Mdme. Marie Krebs, who is now at home, in Dresden, will make her first appearance at the Monday Popular Concerts. Herr Joachim is also promised to appear, and also is Mdme. Schumann.

MR. ARTHUR CHAPPELL informs us that Herr Carl Meyder's project of giving Wednesday afternoon concerts in St. James's Hall next season, which we mentioned three weeks back, is to remain "a project."

THE fate of the Komische Oper in Vienna is now finally decided. Herr Hasemann, who has leased the building, as we mentioned last week, will reopen on October 6 with *Don Caesar*, by Massenot, a work which met with great success when produced at the Paris Opéra Comique. The new capellmeister, Herr Bossenberger (from Hamburg, we believe), will begin his office with the charming opera *Maurer und Schlosser*, after which the second novelty of the season, Auber's *Le Jour du Bonheur*, will be brought out. The director has engaged four or five performers for every part, so that the public can make their own choice.

GREAT excitement is caused in German musical circles by the rumour that the Ministry of Public Instruction in Baden intends to found a "Rhenish Musical Academy" in Wiesbaden. It is reported that Mdme. Jenny Lind, her husband Herr Otto Goldschmidt, and the violinist Professor August Wilhelmj, have already given in their adhesion to this scheme, and Joachim Raff and Mdme. Schumann take great interest in the new foundation. We must add that this news, which we take from the *Kölnische Zeitung*, has not been confirmed yet by any other papers.

WEBER'S *Preciosa*, which for many years has been a constant inhabitant of the "Archives," has been revived at the Stadttheater in Cologne, but without great success, on account of the incompleteness of the performance. The charming ballet music alone aroused enthusiasm.

THE new Stadttheater in Hamburg was opened on the 16th ult. with a performance of *Lohengrin*, preceded by a prologue written by Rudolph Löwenstein, and Weber's "Jubilee" overture.

WE are requested definitely to contradict the report which has lately been circulated that Mdme. Arabella Goddard is on her way back to this country. The talented pianist is at present, we understand, in New Zealand, whence she will proceed to California.

THE American prima donna Mdme. Minnie Hauck appears now for a two months' season at the National Theater in Pesth.

THE great event of this season at the Imperial Opera in Vienna will be the representation of Gluck's *Iphigenia in Aulis*, which will be produced with magnificent sceneries. Gluck's (perhaps) best opera has not been heard in Vienna for a number of years; its revival, therefore, excites nearly as much interest amongst the Vienna amateurs as an absolute novelty.

YESTERDAY week (the 25th ult.) the ceremony of unveiling a statue of the late Michael Balfe in the vestibule of Drury Lane Theatre was performed by Sir Michael Costa. The statue is the work of a young Belgian sculptor, M. Malempré, and is very well executed. The chair was taken by Mr. Gruneisen, who delivered a short address, giving a brief sketch of Balfe's artistic career, and relating the circumstances which had led to the erection of the memorial. After the more formal part of the proceedings were concluded, a *déjeuner* was given to those present by Mr. Chatterton, the lessee of the theatre.

M. LECOCQ, the popular composer of *La Fille de Madame Angot*, and *Giroflé-Girofla*, is at present engaged upon a new operetta, commissioned by M. Humbert, of Brussels. The libretto, by MM. Saint-Albin and Jules Pravel, is entitled *Frederick the Great*. The scene of the operetta is laid in Holland, and the flute-playing monarch is, of course, the principal character.

It is stated by the *Signale* that Mdme. Pauline Lucca has accepted an engagement for the first performances at the new Paris Opera, which is to be opened on January 1, 1875.

A PERFORMANCE given at the Leipzig Stadttheater, for the benefit of the sufferers from the recent fire at Meiningen, has realised the sum of over 600 thalers (904.).

Zoological Society's Latest Publications.

PROCEEDINGS of the SCIENTIFIC MEETINGS of the SOCIETY for 1874. Part III., containing the Papers read at the Scientific Meetings in May and June, 1874. With 20 Plates, mostly coloured, 12s.; with Plates, uncoloured, 3s.

NOTICE.—Commencing from January of the present year the PROCEEDINGS will be issued in Four Parts as follows:—

Part I., containing papers read in Jan. and Feb., on June 1.
" II., " " " " March and April, on Aug. 1.
" III., " " " " May and June, on Oct. 1.
" IV., " " " " Nov. and Dec., on April 1.

The price will be 12s. per part for the Edition with coloured, and 3s. per part for that with uncoloured Plates.

TRANSACTIONS of the SOCIETY. Vol. VIII.

Part IX., price 42s. (completing the volume), containing "Researches upon the Anatomy of the Pinnipedia (Part III.); Descriptive Anatomy of the Sea-Lion (*Otaria jubata*)." By JAMES MURIE, M.D., &c. (Eight Plates.)

These publications may be obtained at the Society's Office, 11 Hanover Square, W.; at Messrs. LONGMANS, the Society's publishers, Paternoster Row, E.C., or through any Bookseller.

Just published, price 3s. 6d.

ON PROTOPLASM; being an Examination of Dr. James Hutchinson Stirling's Criticism of Professor Huxley's Views. By JAMES ROSS, M.D.

London: ROBERT HARDWICKE, 192 Piccadilly.

Established 1834, and Incorporated by Royal Charter.

SCOTTISH UNION FIRE and LIFE INSURANCE COMPANY.

London: 3 Cornhill; Edinburgh and Dublin.

TO LITERARY MEN.

SIGHT IS THE GREATEST GEM OF NATURE.

Save your Eyes. Restore your Sight.

EDE'S PATENT AMERICAN EYE

LIQUID, worth 30 guineas per bottle, has been proved by thousands to be the best ever afforded to the public. Dimness, aged, weak, watery, sore, blood-shot, kells, specks, colds, inflamed, near-sighted, over-worked, and every disease of the eyes, cured in a few dressings. Thousands of Testimonials can be seen. Send a stamped envelope for testimonials, and judge for yourself. Some of the most wonderful cures ever witnessed in men, women, and children, all well known in Birmingham and district; some who had been in hospitals, and under the best medical men of the day. Not the slightest pain in using it. Sold in bottles at 1s. 1d. and 2s. 9d. Prepared only by John Ede, Snowball Villa, Birchfield Road, Birmingham. Sent free by post for 1s and 2s stamps.

NOW COMPLETE.

ANCIENT CLASSICS for ENGLISH READERS. Edited by the Rev. LUCAS COLLINS, M.A. In 20 Vols. crown 8vo, cloth, 2s. 6d. each; or in 10 Vols., neatly bound with calf or vellum back, price £2 10s.

CONTENTS OF THE SERIES.

HOMER: THE ILIAD. By the Editor.
HOMER: THE ODYSSEY. By the Editor.
HERODOTUS. By George C. Swaine, M.A.
ÆSCHYLUS. By Reginald S. Copleston, B.A.
XENOPHON. By Sir Alexander Grant, Bart.
SOPHOCLES. By Clifton W. Collins, M.A.
EURIPIDES. By W. B. Donne.
ARISTOPHANES. By the Editor.
HESIOD AND THEOGNIS. By the Rev. J. Davis, M.A.
THE COMMENTARIES of CÆSAR. By Anthony Trollope.
VIRGIL. By the Editor.
HORACE. By Theodore Martin.
CICERO. By the Editor.
PLINY'S LETTERS. By the Rev. Alfred Church, M.A., and the Rev. W. J. Brodribb, M.A.
JUVENAL. By Edward Walford, M.A.
TACITUS. By W. B. Donne.
LUCIAN. By the Editor.
PLAUTUS AND TERENCE. By the Editor.
PLATO. By Clifton W. Collins, M.A.
GREEK ANTHOLOGY. By Lord Neaves.

"On the whole, the series is well done; from beginning to end a piece of good honest work, without, as far as we can see, any signs of slovenliness or shirking."—*Times*, September 21.
"It is difficult to estimate too highly the value of such a series as this in giving 'English readers' an insight, exact as far as it goes, into those olden times which are so remote and yet to many of us so close."

—*Saturday Review*.
"A series which has done, and is doing, so much towards spreading among Englishmen intelligent and appreciative views of the chief classical authors."—*Standard*.

DALDY, ISBISTER AND CO.'S

FORTHCOMING BOOKS.

LIFE of NORMAN MACLEOD, D.D. By his Brother, the Rev. DONALD MACLEOD, one of Her Majesty's Chaplains, and Editor of *Good Words*. With Two Portraits and numerous Illustrations. 2 vols. demy 8vo.

COMPANION WORK TO "WALKS IN ROME."

DAYS NEAR ROME. By AUGUSTUS J. C. HARE, Author of "Walks in Rome," "Memorials of a Quiet Life," &c. With more than 100 Illustrations by the Author. 2 vols. crown 8vo.

ASHES to ASHES: a Cremation Prelude. By the Rev. H. R. HAWLIS, M.A., Author of "Music and Morals." Small 8vo.

RIVER LEGENDS; or, Father Thames and Father Rhine. By the Right Hon. E. H. KNATCHBULL-HUGESSEN, M.P., Author of "Moonshine," &c. With 40 Illustrations by Gustave Dore. Large post 8vo, cloth gilt extra.

The GREAT ARMY. Sketches of Life and Character in a Thames-side District. By the RIVERSIDE VISITOR. 2 vols. post 8vo.

The LITTLE LAME PRINCE. By the Author of "John Halifax, Gentleman." With 24 Illustrations by J. M'L. Ralston. Crown 8vo, cloth gilt extra.

GEOLOGY, for Students and General Readers, embodying the most recent Theories and Discoveries. By A. H. GREEN, M.A., Professor of Geology and Mining in the Yorkshire College of Science.

PART I. The ELEMENTS of PHYSICAL GEOLOGY. With upwards of 100 Illustrations by the Author. Demy 8vo.

PART II. The ELEMENTS of STRATIGRAPHICAL GEOLOGY. With upwards of 100 Illustrations by the Author. Demy 8vo.

NOBLE WORKERS: a Book of Examples for Young Men. By H. A. PAGE, Author of "Golden Lives." With Portraits. Crown 8vo, cloth extra.

FIRESIDE HOMILIES. By the late HENRY ALFORD, D.D., Dean of Canterbury. Edited by his Widow. Small 8vo.

The CHILDREN'S SERVICE, for CHURCH and HOME. With Selected Hymns and Tunes, and Short Sermons. By the Rev. H. MARTYN-HART, M.A. Square 8vo.

TREATISE on MINING. By LOTTNER and SERLO, of the Berlin Academy of Mining. Translated from the German by Professor L. E. NEVE FOSTER and Mr. GALLOWAY. With 268 Illustrations and Diagrams. Demy 8vo.

THERESA. By GEORGIANA M. CRAIK, Author of "Sylvia's Choice." Post 8vo.

ETYMOLOGICAL GEOGRAPHY. By E. M. BLACKIE. Edited, with an Introduction, by JOHN STUART BLACKIE, Professor of Greek in the University of Edinburgh. Crown 8vo.

CAMERA OBSCURA. A New Volume of Poems. By DORA GREENWELL. Crown 8vo.

The HISTORY of CERAMIC ART. By LLEWELLYN JEWITT, F.S.A. Profusely Illustrated. Medium 8vo.

The SCIENCE of GEMS, JEWELS, COINS, and MEDALS, Ancient and Modern. By ARCHIBALD B. LING, M.D., A.M., F.R.S. With Illustrations. New Edition, Revised and Corrected. Demy 8vo.

PRINCIPLES of the INTERIOR or HIDDEN LIFE. Designed particularly for the consideration of those who are seeking assurance of faith and perfect love. By THOMAS C. UPHAM, D.D. With a Preface by R. PEAR-SALL SMITH. Crown 8vo.

MY OWN PEOPLE: a Family Chronicle. By Mrs. VESEY. With Illustrations. Post 8vo.

The CHILDREN'S PASTIME. With 100 Full-page Illustrations by Eminent Artists, and Descriptive Stories by E. SEGUIN. Post 8vo, cloth extra.

SONGS of OUR YOUTH. By the Author of "John Halifax, Gentleman." Set to Music, and handsomely bound. Demy 4to, cloth gilt extra.

A NEW WORK. By SIR ARTHUR HELPS, K.C.B., Author of "Friends in Council," "Ivan de Biron," &c. Post 8vo.

MAN and BEAST, HERE and HEREAFTER. With Illustrative Anecdotes. By the Rev. J. G. WOOD, M.A., Author of "Homes without Hands," &c. 2 vols. post 8vo.

GEOLOGICAL CLIMATE and TIME. A Theory of Secular Changes of the Earth's Climate. By JAMES CROLL, of H.M. Geological Survey. With Illustrations. Demy 8vo.

The AUTOBIOGRAPHY of THOMAS GUTHRIE, D.D., and Memoir by his Sons, the Rev. DAVID K. GUTHRIE and CHARLES J. GUTHRIE, M.A. Vol. II., completing the work, with Portrait; and Photograph of Dr. Guthrie Preaching in a Highland Glen, from the Painting by Sir George Harvey, P.R.S.A. Post 8vo.

ENGLISH PORTRAITS. By C. A. SAINTE-BEUVE, of the French Academy. Collected and Translated from the "Causeries du Lundi," by W. F. RAE, Editor of "Taine's Notes on England," &c. With Biographical and Critical Introduction. Crown 8vo.

CONTENTS:—Mary Queen of Scots—Lord Chesterfield—Benjamin Franklin—Edward Gibbon—William Cowper—English Literature by H. Taine, and Pope as a Poet.

The GOSAU SMITHY, and other Stories. By Mrs. PARR, Author of "Dorothy Fox." 2 vols. post 8vo.

The MANOR HOUSE, and other Poems. By ADA CAMBRIDGE. Small 8vo.

SHAKSPEARE DIVERSIONS. By FRANCIS JACOX, B.A., Author of "Cues from all Quarters." Post 8vo.

MUSICAL COMPOSERS and their WORKS. For the Use of Schools and Students. By SARAH TYTLER. Crown 8vo. Uniform with the Author's "Old Masters" and "Modern Painters."

ULRICH VON HUTTEN: his Life and Times. By DAVID FRIEDRICH STRAUSS. Translated, with the Author's permission, by Mrs. STURGE. Post 8vo.

The PROPHET HOSEA. By the Rev. STANLEY LEATHES, M.A., Professor of Divinity, King's College, London. Crown 8vo.

LIFE in the OUTER HEBRIDES. By G. ANDERSON SMITH, Author of "Off the Chain." With Illustrations. Post 8vo.

The PILGRIM PSALMS. By the Rev. SAMUEL COX, Author of "The Quest of the Chief Good." Crown 8vo.

MY MOTHER and I. By the Author of "John Halifax, Gentleman." New and Cheaper Edition. With Illustrations by J. M'L. Ralston. Post 8vo, cloth extra.

The HUGUENOTS in FRANCE, after the Revocation of the Edict of Nantes; with a Visit to the Country of the Vandois. By SAMUEL SMILES. New and Cheaper Edition. Uniform with "Self-Help." Crown 8vo.

ANIMALS and their MASTERS. By the Author of "Friends in Council." New and Cheaper Edition. Crown 8vo.

The CREATION; or, Dynamical System of the Earth's Formation. In accordance with the Mosiac Record and the latest Discoveries of Science. By ARCHIBALD T. RITCHIE. Demy 8vo.

GOOD WOODS for 1874. In one handsome royal 8vo. volume, beautifully illustrated. Cloth gilt extra, 7s. 6d.

SATURDAY, OCTOBER 10, 1874.

No. 127, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

LITERATURE.

The Letters and the Life of Francis Bacon.
By James Spedding. Vol. VII. (London: Longmans, 1874.)

WHEN Bacon bequeathed his "name and memory . . . to men's charitable speeches, and to foreign nations, and the next ages," he gave one more evidence of that sanguine temperament which led him to imagine that the work of building up a scientific knowledge of the universe was one comparatively easy of accomplishment. It was hardly possible for any generation earlier than the present one to take other than a prejudiced view of the career of a statesman whose more prominent political views lay athwart the political current of the two centuries which followed his life, and in which historical writing was more political and less scientific than it is at present.

How Mr. Spedding has acquitted himself of his task is known to all to whom the subject has the slightest interest. Differences of opinion on points of detail there may be; but there can be no difference of opinion on the main point, that these volumes enable us for the first time to know what Bacon was, and to appreciate his moral as well as his intellectual qualities. Readers of the concluding volume will naturally ask whether anything has been added to their knowledge of the circumstances of Bacon's disgrace. But though Mr. Spedding never touches anything without adding something to our power of understanding it, and his remarks on the incompetency of the House of Lords as a judicial body bring into relief a hitherto neglected side of the story, he has hardly been able to throw much new light upon the subject, except for those who have taken the utter darkness of Macaulay's essay for light. After all, as Mr. Spedding shows, Bacon's own confession forms the only satisfactory evidence against him, and when we leave the question of legal guilt to enquire into the moral side of the fault committed, we are landed in a difficulty which can never be solved with absolute certainty, but on which Mr. Spedding's explanation may be accepted as being as near the truth as it is possible for us to arrive.

"I know," he says, (vii. 211), "nothing more inexplicable than Bacon's unconsciousness of the state of his own case, unless it be the case itself. That he, of all men, whose fault had always been too much carelessness about money—who, though always too ready to borrow, to give, to lend, and to spend, had never been either a bargainer, or a grasper, or a hoarder, and whose professional experience must have continually reminded him of the peril of meddling with anything that could be construed into corruption—that he should have allowed himself on any account to accept money from suitors while their cases were before him, is wonderful. That he should have done it without feeling at the time that he was laying himself open to a charge of what in law would be called

bribery, is more wonderful still. That he should have done it often, and not lived under an abiding sense of insecurity—from the consciousness that he had secrets to conceal, of which the disclosure would be fatal to his reputation, yet the safe keeping did not rest solely with himself—is most wonderful of all. Give him credit for nothing more than ordinary intelligence and ordinary prudence—wisdom for a man's self—and it seems almost incredible. And yet I believe it was the fact. The whole course of his behaviour, from the first rumour to the final sentence, convinces me that not the discovery of the thing only, but the thing itself, came upon him as a surprise; and that if anybody had told him the day before that he stood in danger of a charge of taking bribes, he would have received the suggestion with unaffected incredulity. How far I am justified in thinking so, the reader shall judge for himself; for the impression is derived solely from the tenor of the correspondence which will be laid before him in due order."

Those at least who, like myself, take Mr. Spedding's view of Bacon's conduct in this matter, may be excused if they turn aside, as if relieved from a weight, to that which is of far greater historical importance than any question of Bacon's moral guilt or innocence, namely, to the relation between his political views and those held by others of his day. In this respect Bacon's position seems to stand out in terrible isolation.

"Cui neque apud Dannos usquam locus; et super ipsi Dardanidae infensi poenas cum sanguine poseunt."

The Greeks of the Court reject his advice; the Trojans of the Commons attack him as an enemy. That he had no intellectual foothold in the Court may be looked on as certain. Again and again his counsels are tendered on matters of high political importance. But neither James nor Buckingham care to follow them. It is equally certain that he saw with distrust the rising authority of the Commons, and had no wish to accord to them larger constitutional powers than they had possessed in the days of his youth. But is it equally certain that he was separated from the House of Commons by as wide a gulf as Mr. Spedding appears to imagine?

The picture which Mr. Spedding draws of the House of Commons is indeed a dark one. Not content with pointing out that they were as yet in many respects unfit to exercise power, that they sometimes found objections to a policy when they were called to pay for it, which had not occurred to them as long as they had only to talk about it, and that their anxiety to go to war was less ardent in 1625 than it was in 1621, he speaks of them as ready to talk of fighting for the Palatinate, but always shrinking from carrying their words into deeds, and leaving the King in the lurch on every occasion when he had a right to call upon them for support. The only thing that they really cared about was the extension of their own privileges, an object which they pursued with such ardour that, by dint of their possession of the power of the purse, they at last succeeded in making themselves practically the sovereigns of England.

Is this true as a whole, or has Mr. Spedding left out of consideration facts which would considerably modify his very harsh judgment? In the first place, we know by experience that a political assembly without leadership of some kind is at its worst, and

if the King failed in supplying that leadership, part of the blame must naturally fall upon him. Let us see now how far such leadership was supplied. At the beginning of the matter when Parliament met in 1621, Mr. Spedding seems quite clear that the King was not in fault. James, he holds, wished to make peace with a sword in his hand. On February 15, the Commons were told (vii. 180) that an army for the Palatinate "would require" 500,000*l.* per annum at the least, which was more than six subsidies would come to. They voted, however, only two subsidies; "which were given" as Coke explained "none gain-saying, and freely: not on any consideration or condition for or concerning the Palatinate."

This Mr. Spedding holds to imply, "that upon the question of raising and supporting an army for the recovery of the Palatinate they made no engagement whatever, so that the advantage of being known to be prepared for war was lost."

This is true enough, but is it certain that the blame was all on the side of the Commons? In the first place, there is nothing to show that they meant to refuse such an engagement if they were properly required to give one. The King had asked for money, first for his own needs, secondly for the Palatinate. In moving for the vote of two subsidies, Sir Thomas Roe explained that they were "to relieve the King's wants in these times of necessity," that is to say, to meet the first demand and not the second. If we had the whole of the debates in committee, we should doubtless know more about the feelings of the House than we do. As it is, there is no reason to suppose that James intended to levy an army at once. We know that Calvert merely explained what an army would cost, without saying that the King meant to send one. We know too that a few weeks later, when Christian IV. wanted James to negotiate with an army in the field, he positively refused to do so, and that when the two subsidies were offered him he spoke of them as "giving him honour and credit abroad." If, then, all that James wanted was not to levy an army, but to have money enough in the Exchequer to levy an army at some future time, it is easy to understand that the Commons, with the never-ending negotiations of the past years in their minds, would be reasonably reluctant to grant money till they knew exactly what was to be done with it. At all events, there was nothing to prevent James, if he felt the urgent necessity of a larger grant, from coming forward to say so.

At last, however, before the House adjourned, they did make the engagement which Mr. Spedding thinks they ought to have made in February, to adventure their lives and fortunes for the recovery of the Palatinate. But though in November they were ready to vote the money needed during the winter, they (vii. 331) "coupled it with a petition setting forth their own view of what should be done, which being in direct opposition to the course to which the Government had committed itself, brought up the old dispute on the question of abstract political right."

It is a pity that Mr. Spedding has passed over all this so briefly. The clauses of the petition relating to the war recommended the King to re-unite the princes of the union, "and not to rest upon a war in those parts only, which will consume your treasure, and discourage the hearts of your subjects," and asking that the point of the King's sword "may be against that prince (what opinion of potency soever he hath) who first diverted and hath since maintained the war in the Palatinate."

The advice thus tendered, not as a condition of the subsidy immediately needed, but plainly as a condition of the future subsidies which would be required for the war in the next summer campaign, would appear to deserve more respect than Mr. Spedding accords it to. It may have been wise or unwise. But a biographer of Bacon should have pointed out that, so far, it was substantially Bacon's policy. Mr. Spedding has presented us with an unpublished paper of Bacon's about war with Spain, and he has, for the first time, given us the whole of the "Considerations touching a war with Spain," Bacon's most elaborate expression of opinion on the subject. It is impossible to read these papers without seeing that in this matter Bacon was with the Commons and not with James. He cared about war with Spain and he cared little or nothing about war with the Emperor or the Duke of Bavaria. Spain was the author of the mischief, and from her reparation must be sought. Writing in 1624, he distinctly says:—

"Lastly, let there be no mistaking, as if when I speak of a war for the recovery of the Palatinate I meant that it must be in *linea recta* upon the place."

This thought, which neither he nor the Commons would probably have expressed so deliberately in 1621, when the Palatinate was still unsubdued, was the leading idea of the Commons in 1624. Failing to see this, Mr. Spedding is still harder upon the fourth than he is upon the third Parliament of James I. He argues all through (vii. 467) as if it were impossible for any one to believe that the Palatinate could be recovered without sending an English army to Heidelberg, or that an attack upon Spain by sea would not be completely efficacious. Yet, unless we have grasped the idea that two utterly distinct methods of warfare were at issue in the Parliament of 1624, we are always liable to interpret as the result of mere parsimony that which was, in great part at least, the consequence of dissatisfaction with the designs of those who would have the spending of the money. If the Commons objected to mention the recovery of the Palatinate in the Subsidy Bill, it may fairly be attributed to the fact that it was known that James proposed to set about recovering it in a way of which they disapproved. Why are we to be asked to regard them as careless of keeping their engagement, because they believed that the money which the King wanted would simply be thrown away if it were employed as he proposed to employ it?

In the same way Mr. Spedding's interpretation of Coke's speech of March 19, 1624, on which he lays great stress, showing that Coke knew that the war would cost

900,000*l.*, and yet only wished to see 300,000*l.* voted, is given in forgetfulness, that already on the 14th the King had stated, that before entering upon the recovery of the Palatinate, he "must not only deal with" his "own people, but with" his "neighbours and allies." The House was not asked even by the Government speakers to vote the whole sum at once, but only to declare their readiness to do so at a future time. I do not see, therefore, that the Commons were wrong if they wished not to make such an engagement before James was ready to inform them what his plan of action was. Mr. Spedding forgets that neither the House nor the King himself knew whether there was to be an invasion of the Palatinate at all; and that James reserved that disclosure for the future session, which was to take place in November.

Yet, after all has been said, it must be acknowledged that the parsimony of which Mr. Spedding complains was there. The question is whether it was the main cause of the reluctance of the House to vote money, or whether it only came to the surface when the depths were stirred by other and higher motives.

Mr. Spedding's other point, that the leaders of the country party cared less about the war in 1625 than in 1621, is fairly made out, though the reason which he suggested, that they had come to look upon it as Buckingham's war, is not a probable one. It is more likely that they cared less even for an attack upon Spain after all danger of seeing an Infanta in England was at an end; and the mismanagement had been so great that they may well have despaired of seeing any war successfully carried on under the existing management.

However this may be, the concordance between Bacon's views and the policy of the Commons in this matter is a fact of no inconsiderable importance in any general view of his political position. The impression left upon the careful reader of Mr. Spedding's volumes is that, though the ordinary coarse explanation of Bacon's life is entirely untrue, he was nevertheless on the wrong side in politics. He served a monarch who was unable to understand his greatness, and he had to pay court to a favourite who, with many brilliant qualities, was quite incapable of guiding a State. We know that with Bacon's education and antecedents it could not have been otherwise. But if the hope of the nation was with the House of Commons in spite of all its faults, we may regret that his life's work did not lie in guiding their efforts and moderating their extravagances, rather than in throwing out words of wisdom to be embalmed in libraries till a future generation thought it worth while to disentomb them.

In his preface Mr. Spedding thinks it necessary to explain that it was impossible to accomplish his task in less than seven volumes. Those who care to understand Bacon will not wish that he had shortened his work by a single line. But there can be no doubt that those whose enthusiasm will lead them to read through seven volumes will not be many. Mr. Spedding must at present be content with "audience fit, though few." But now that his great task is ac-

complished, and has become a treasure for all time, cannot he be induced to employ his leisure upon a more exoteric rendering of the life-story of his hero. A compendious life of Bacon, which is at the same time true and readable, is a desideratum in our literature? Till Mr. Spedding's seven volumes were completed no one could fill the void. And now, he alone who has cut through the tangled wood of prejudice and falsehood, is capable of tracing out the smooth road on which the feet of other travellers may step firmly in the future.

It is impossible to take leave of Mr. Spedding—to meet him again, it is to be hoped, in some other field—without such regret as can hardly be stirred by any other writer. It is not merely that his great contribution to English history has no rival for accuracy of judgment, and for industry carried to its extreme point; or that he has taught us to know in his true character one of the greatest statesmen of a land fertile in statesmanship. His book is more than a history, more than a biography. It is a moral school, teaching historical writers to combat the sin which most easily besets them, the tendency to put their own interpretation upon doubtful facts, and their own thoughts into the minds of men of other ages.

SAMUEL R. GARDINER.

Livingstone in Africa. By Hon. Roden Noel. (London: Sampson Low & Co.)

In *Livingstone in Africa* Mr. Roden Noel has found a subject admirably suited to develop his qualities as a poet. These qualities appear to be a passionate and catholic sympathy with human life, a power of seeing the romance of contemporary history, a faculty for describing grandiose effects of tropical scenery, and a peculiar skill in the employment of strange and sonorous local names. Words "for which no rhyme our language yields," words like Tanganyika, "Congo, and Nile, and long Leeambayee," Ngami, Bemba, Moero, Nyassa, give a barbaric splendour to the verse. Few poets have used scientific guesses or discoveries more felicitously than Mr. Noel in this passage on the hoar antiquity of the African continent:—

"Most ancient realm of all this ancient earth,
Thought fain to sound thine hoar antiquity!
Europe and Asia were not, when thy form
Brooded in solemn grandeur, as to-day,
Over dark ocean, when Diynodon,
Ancestor of thy huge Leviathan,
Ruled over mighty seas and estuaries;
When melancholy vapours veil'd strange stars,
Ere man's wan yearning unavailing eyes
Awoke to wonder!"

This sense of the antique secret of Africa makes a background of mystery to the poem, it is the dream with which Livingstone's life is rounded, as other men's are shadowed with the elder mystery of death.

"Ye mountains, hiding undiscovered worlds,
So mused in spirit the lone wanderer,
I hunger till I pass your mighty doors,
And lay my hand upon the Mystery!
African Andes, vast, inviolate,
Crowned with the cloud, robed round with sombre forest,
Whose virgin snow no human feet profane
Have swept, but only the wild eagle's wing,
Of old your ghost on Rumour's shadowy breath,
Wandered abroad, oh Mountains of the Moon!"

And still ye are no more than a dim name :
Of old the Egyptian, from your loins that loom
Large in far realms of rumour drew the Nile.
Ye, couchant o'er the sultry continent,
Seem the great guardian Lion of Africa,
Who from primeval ages all alone
Silently stern, confronts a crimson dawn
Over fair Indian seas, with face that towers
Sunward, supreme."

This is surely stately and admirable verse, and it would be easy to find many passages to match it in the long soliloquy in which Livingstone reviews his life, his hopes, his love of humanity, of mystery, and adventure. He sees in a kind of vision, how "all the land is full of monstrous wrong," he watches a pageant of the African races flit before him—Egyptians, the masters of the race in wisdom; Negroes, the slaves of slaves; Dwarfs, the jest of the world; and still lower forms of human life—

Dark, unimaginable human lives;
Wearing what uncouth forms, allied to some
Misshapen horrors of the forest wild—
Weird startling mockery of immortal man;
Shocking the soul with chill mistrustful fear,
And doubt of her pre-eminent destiny.

In reference to these races, Mr. Noel has brought out some of the merits of a new subject for poetry,—the earlier superstitions and usages of the savage. The scenes in which he describes the death of a young brave; the desolation of his father, who must wander into the wild, "plucking the berries, pulling up the roots, a living skeleton;" the anger of the tribe, which, as usual, believes the dead warrior to have been bewitched; the apparition of the seer from his cavern in the hills, his denunciation of a girl, and her ordeal and death, are pictures of the greatest originality. The account of a savage execution has the *verve* and colour of Henri Regnault's best-known work. Yet, in spite of these merits, it must be admitted that *Livingstone in Africa* has some of the *longueurs* which seem necessary evils in every book on Africa. The tropic scenery is too hot, too sultry, and lush; too entangled, and gorgeous. And it is a pity that Mr. Noel, either from inadvertence, or of set purpose, has permitted himself lines that are most scrannel, and expressions that shock the calm majesty of grammar. What is meant by saying that "dews of slumber rustle rainbow rain," or that "the shadow with declining day fades rainbow splendour of the forest far"? When Mr. Noel makes Livingstone say—

"I hear my father at our evening prayer,
And wild Gael singing of my grandmother,"

the reader can but suppose that some Celtic admirer chanted an ode in praise of the explorer's respectable relative. "Gael" is not an adjective. It is not possible to praise the few scattered lyrics in this work; the best is the imitation of an African folksong:—

"Oh, moon! Ilogo! spirit of the moon!"

and so on.

There is not much that is new in Mr. Noel's preface on the merits of past and present life as themes for poetry. Mr. Matthew Arnold has summed the matter up for this generation at least. All great action and noble passion are stuff for poetry, and Mr. Noel has shown that even the emissary of the *New York Herald* can be treated of

with propriety in blank verse. It is improbable that any of the French prize poems on Livingstone will prove superior to this spirited composition. And there unluckily is the blot. There is something in a poem on events of the day before yesterday which suggests the notion of a prize poem. But this association of ideas may be peculiar to people whom Mr. Noel scorns as "superfine collegians." A. LANG.

The Englishman's Illustrated Guide Book to the United States and Canada, &c., &c.
(London: Longmans & Co., 1874.)

THE only excuse for the existence of a guide book of travel is the shallow one that travellers in general neither know what they go out to see, nor are animated by the healthy spirit of adventure and discovery, which are the soul of voyaging, but are mainly willing to be told what they shall look for, and what they shall think of it when found. The guide book traveller is after all only a more independent Cook's tourist, in whom the desire not to omit any notable object in the circuit of his voyage is stronger than any other motive of travel. The "tourist" has become the antithesis of the travelled man, as the examined of the educated—and from the nervous and hurried American who rushes from London to Moscow and back again in six weeks, looks at everything and sees nothing, to the humblest sheep in a Cook's flock, who is led in muffled economy through a stated tour for a stipulated price, the gradation is one merely of different measures of ignorance.

But however genuine and complete the satisfaction of finding for oneself, as one might before guide books were invented, the old world marvels, however great the charm of unexpectedness, lost to the guide-book-worm, it is not to be expected that anyone nowadays will go abroad without Murray or Baedeker. No man in the least affected by modern views will prefer to find and enjoy for himself what may be found in a limited field of research to going thoroughly through the programme of the grand tour, and knowing when he gets back that he has seen it all—that no stone with a mark on it was forgotten.

And as we must have the guide book, we have a right to demand something better than the *Englishman's Illustrated Guide Book to the New World*—as weak a bit of book-making as critic ever set his face against—too weak for serious criticism, and too incomplete for use. Various internal indications point to an American authorship, not the least being the general assumption that what Americans are most proud of is that which an Englishman is most anxious to see—that because Mushroom City is a marvel amongst mushrooms, it is therefore that which best repays the assiduous study of what the American reporter calls the "intelligent foreigner." New York, which is of all cities in the United States the least American, occupies a large space, about thirty pages, Boston one page, Philadelphia ditto, Washington less than three, and all the new prosperous cities and towns, which are the evidences merely of the business

energy of the American community, are noted in all the emphasis of the national self-congratulation; we are not told that in the large majority of them there is not an object worth stopping to see, or a hotel that one would stop comfortably at, or find a dinner fit to eat; while the great features of the country that would have most charm for an inhabitant of the Old World—the grand wild nature, the primeval forest—(with the exception of the Far West, Yosemite, and the Yellowstone, which few foreigners comparatively are able to reach) are entirely unnoticed. What man versed in the European variety of his species could suppose that the results of the century-old civilisation of America could excite more than the passing curiosity of travellers habituated to the Old World; and leave out of account, as has the compiler of this Guide Book, those regions which still, within easy access of the great lines of travel, preserve the charms of primeval nature? A few paragraphs are given to the western plains; a tolerably full description of the Yosemite valley, borrowed from Professor Whitney; an epitome of the report of N. P. Langford, Superintendent of the Yellowstone National Park; but of original observation or experience not a word; the author scarcely deigns indeed to mention the only less interesting but perfectly accessible districts where nature is still supreme, and where at small expense and with little time, an Englishman may see a landscape unscarred by human conquest, and better worth his time and study than wildernesses of brick and mortar, which only recall in impotent emulation the things he left behind him. Of the Adirondacks, a vast wilderness in the north of New York State, full of the grandest passages of natural beauty, a maze of lakes and rivers, a forest Venice traversed by skiff and canoe only, a single paragraph (in brackets) informs us that fishing and shooting are to be had there; four lines tell us of the still wild regions of the Saguenay in Canada, and the great "Maine woods" are unnoticed. And there is perhaps in the whole itinerary of the English tourist nothing so easily accessible, which so abundantly repays the time and expense, as a trip into this region. The railway carries him within a few miles of Moosehead lake, the principal sheet of water among the many there, and a comfortable hotel, on a breezy point jutting out into the middle of the lake, commands on every side views of mountains clad in the primeval forest; while a solitude, absolutely unbroken by human foot, may, for months together, be reached in a few hours' paddle—a solitude so vast that were the visitors to it an hundred fold more numerous than they are, they could still find room to lose sight of each other. There is not, indeed, among all those numerous wild retreats, now becoming so attractive even to Americans, one which possesses the charm of unexpectedness and contrast to the extent that this does. A tiny steamer twice a day carries its passengers from the end of the land journey up to the Mount Kines House, and there leaves him face to face with the wilderness. A guide with bark-canoe is at hand, and a push into one of the rivers that empty themselves into the lake

brings him into a trackless forest, which, save for a tree lost here and there, is such as the sun, and rain, and winds made it, untold centuries ago. It is not the Alps, nor Italy indeed, nor beautiful or picturesque perhaps but grand and impressive, as nothing else but the open sea and Sahara can be—one of the mightiest objects of human interest, and one which no man or woman bred in the amenities of antique culture should omit to see—worth all the Chicagos, and Denvers, and Cincinnati, and Washingtons put together.

Of Canada there is almost nothing in our guide book; of Florida and of the Southern States nothing, with the exception of a few pages on Virginia; but nearly the half of it, in the form of appendix, is filled with eulogiums of certain districts of the United States as eligible for settlers; and there is this tone and substance of a land-agency circular, which taints the book with suspicion of a purpose not altogether in the interest of the tourist. After the complete and admirable guidebooks to the whole of North America published by Osgood of Boston, there is no excuse whatever for the appearance of this incomplete epitome—at least, none which appears to the disinterested public.

It is perhaps hardly worth while to say that its style and grammar are such as few American newspapers would be guilty of, and its statements of detail sometimes of a ludicrous inaccuracy. In the midst of a description of Quebec we are treated to the following sentence, sublime in its comprehensiveness, if unintelligible to anyone not versed in Canadian history: "At the foot of the citadel (*sic*) stands a tower over which now floats the British flag, on the spot where Montgomery and his soldiers all fell, swept by the grape-shot of a single gun manned by a Canadian artillerist." This passage of history puts the story of David and Goliath utterly to shame.

Perhaps the worst fault among the book's many is its utter want of coherence and system. It attains compactness by omission of needful information, and redeems its fault of style by copious quotation.

W. J. STILLMAN.

OUR PRISONS AND PENAL LAWS.

Il Sistema Penitenziario d'Inghilterra e d'Irlanda. Relazione di Martino Beltrani Scalia, Ispettore Generale delle Carceri d'Italia. 2ª Edizione. (Roma, 1874.)

LIVING in a land where law is so well administered that the majority of us have little to fear for ourselves or our possessions from personal violence and depredation, we are apt to let the veil of ignorance hide from us the thought of the miserable criminal population which nevertheless exists in our midst. But to the honour of our country it may be affirmed that for the last hundred years—and it is just one hundred years since Howard laid his first statement before the House of Commons—followers of the great philanthropist who began the work of prison reform have not been wanting, and our Government has persevered in its endeavours to find out the best method of dealing with crime, sparing neither money

nor labour in the great work which, to quote the words with which Signor Scalia closes the volume before us, will not be reckoned the least of the glories of our nation.

Italy in the last century was in advance of us in its theories and practice as regards prisons. As early as 1704 a prison reformatory for youthful offenders had been established in Rome. Howard visited it and copied the sentence inscribed over the door: "*Pope Clement XI. For the correction and instruction of profligate youth, that they who when idle were injurious, when instructed might be useful to the State.*" Within was written: "*It is of little advantage to restrain the bad by punishment, unless you render them good by discipline.*"—"an admirable sentence," remarks Howard, "in which the grand purpose of all civil policy relative to criminals is expressed." The word "*Silentium*" was inscribed in the middle of the room, which, when Howard saw it, was occupied by fifty boys engaged in spinning.*

Beccaria published his celebrated treatise on *Crimes and Punishments* at Milan in 1764. His humane and enlightened views led to many improvements in the criminal codes of his own and other continental nations. His work was extensively read, and, including translations, has passed through as many as fifty editions. He contended against the use of cruel punishments, saying that, "as a fluid rises to the same height as that which surrounds it, so, in proportion as punishments become cruel, the minds of men grow hardened and insensible." Not in the severity but in the certainty of punishment, as we now fully recognise, lies the chief deterrent force for the suppression of crime and protection of society. And further, Beccaria pointed to "the perfecting of the system of education" as "the most certain method of preventing crimes"—the method which we in England are now earnestly endeavouring to pursue.

The volume before us, as its title indicates, is an account of our own prison system. Consequently to those already familiar with the subject and with the important and interesting discussions to which it has given rise, this work of Signor Scalia's can give no fresh information; but it is interesting to know how the state of our country as regards crime and the principles which guide our treatment of it strike a foreigner of ability and intelligence, who from his position as Inspector General of Prisons in Italy is intimately acquainted with the working of the penal code of his own land. The problems to be dealt with, in any rational and humane consideration of the subject, are such as must be of interest to all students of human nature, considered in its aspects, physical, mental, and moral: the effects of the various systems of treatment on the body, and through the body on the mind and disposition, have to be examined in order to determine what regulations respecting food, labour, amount of intercourse with, or separation from others, &c., prove most efficacious for the attainment of the great end of subduing evil, and rendering the guilty amenable to better influences,

* See the account of Howard's visit to San Michele, *The Works of Howard*, vol. i. page 114 of the 4th edition, published in 1792.

while sanity of mind is not risked nor health of body sacrificed.

Signor Beltrani Scalia having been invited in 1868 by Sir Walter Crofton to attend the Social Science meetings at Birmingham, was commissioned by the Italian Government to study the penal system carried out in Ireland. His researches, however, were not limited to the present; he felt that the institutions of a people ought to be studied in their historical development, and that the lessons to be gathered from the history of the past were specially necessary for the object he had in view.

In the first section of the book Signor Scalia gives an admirable and interesting summary of our penal laws during the last two and a half centuries. He shows how the simple idea of our rough and vigorous forefathers was to strike terror into the minds of evil-doers by the severity of the punishments, their rigour—"cruelty" is Signor Scalia's expression—exceeding that of the statutes of most of the other European nations. The corporal punishments used—such as stripes and chains, the pillory and stocks, and death, which was the award of many crimes—having as their object to make an example of the guilty, which should deter others from evil courses; the reformation of the offender was not the object in view. The prisons served as places of detention, in which were kept malefactors condemned to death and accused persons, and unhappily debtors and political offenders also, but they were not places to which the guilty were sentenced. The first prison arranged with a different intention, viz., as a house of correction, was Bridewell. A great many idle people having been thrown on society by the destruction of the convents in the days of Henry VIII., it was deemed advisable to enforce work on vagabonds and destitute persons who were able to work. The old statute of Edward VI. respecting Bridewell says that it was destined "to destroy idleness, which is the enemy of all virtues, and to encourage industry, which conquers all vices." A statute of Elizabeth passed in 1597 commanded the erection of similar houses of correction in all the principal towns of the country, and ordained that "such rogues as were dangerous . . . should be banished from the land." Thus began the system of transportation—and horrible it was as then carried out, for the unhappy prisoners became the slaves of speculators, who saved the country the expense of transporting them to America, and who trafficked in them as afterward in negroes. It is not surprising that some preferred the sentence of death to such a fate as this.

Passing over a dark period in the history of English prisons, we come at last to the noble figure of John Howard. He, like another true friend of prisoners, St. Vincent de Paul, had known something of their sufferings by personal experience, the vessel in which he was sailing for Lisbon in 1756 having been captured by the French; but it was, as he himself states in the simple words with which his great work on prisons begins, his duties as sheriff in the county of Bedford that made him acquainted with the wrongs and miseries of prisoners, and "ex-

cited him to activity" on their behalf. The special circumstance which arrested his attention and roused the sense of justice, which is strong in our race, was "the seeing some who by the verdict of the juries were not guilty, dragged back to gaol and locked up again till they should pay sundry fees to the gaoler." He applied to the justices for a salary for the gaoler in lieu of his fees; but a precedent, they replied, was needed, before they could grant it. He accordingly rode through the neighbouring counties in search of one, but in vain. The scenes of misery he witnessed in the county gaols determined the whole future of his life. Before turning to the pages in which he relates these horrors—the overcrowding, the mixing of the untried and innocent with the guilty, and in many places of the male with the female prisoners, the starvation, uncleanness, degradation, diseases and vice, which made our prisons a disgrace to the human race—it is pleasant to read the dedication to the House of Commons, in which Howard expresses his gratitude for the encouragement they had given to his design; pleasant to remember that when his statement was first laid before them, in March 1774, he received a vote of thanks; and pleasant to think that, in spite of all abuses, brutality, slowness to amend, and relapses into evil, England since the days her eyes were opened has worked on in the sorely needed reformation, until now the question of the treatment of prisoners may be considered to a great extent satisfactorily solved.

The matter of pressing importance* now is, how to provide for the rising generation so that none may be driven through neglect, ignorance, or want into the ranks of the criminal class, or that, if in childhood a wrong step has been taken, the young offenders may be subjected to such discipline as shall correct their bad propensities, and at the same time be taught how to gain an honest livelihood. Signor Scalia points out our Reformatories, Industrial Schools, Discharged Prisoners' Aid Society, and Homes where female prisoners may pass the last six months of their sentence—all these institutions originating in efforts of private benevolence, and being subsequently adopted and aided by the State. He notices as a marked feature in our national character, the spirit of independent and individual enterprise which prepared these schemes of public utility—so that our Government has followed rather than led in the movement. The success of this method of action he attributes to our practical sense, which never lost itself in search of unrealisable theories; to our honesty in seeking to find out the evil in its full extent; and to the number of philanthropic and able men and women who freely give their services to the cause. And so long as this is the case, the result is healthy and good. But it is well to be reminded that our plan—in which private activity is the motive power, public opinion the ruling power in all social reforms—

throws some portion of the responsibility of the well-being of society on each member of the community: no Englishman may say, "Am I my brother's keeper?"

Howard was not alone in his efforts on behalf of the prisoner. The humanising influence of Christianity was at work in the nation, impressing on the one hand the preciousness of each individual life, and on the other the sanctity of the bond which unites together each member of the human family. The year before Howard's labours began, in 1772, a society for the relief of persons imprisoned for small debts had been formed. In 1776, a book on Prison Discipline had been published by Jonas Hanway (misspelt Honway), a man whom Signor Scalia says has been overlooked, though his views agreed with those of Beccaria and Howard.

Signor Scalia also mentions Holmes, who presided over a Commission for examining into the state of Irish prisons, and who has been called the Howard of Ireland; and Jeremy Fitzpatrick, who, in 1784, published in Dublin an essay on gaol abuses, &c.

In 1779 Howard's Penitentiary Act was passed, and then a fresh subject had to be considered in the plans for prisoners, for the war with our colonies in America having broken out, the former outlet for transportation was stopped. For a time the convicts were sentenced to the hulks, but in 1787 the first batch of convicts, 800 in number, was sent to Botany Bay.

The plan of transportation, which ceased only ten years ago, was from the first opposed by Howard and Hanway, and then by Jeremy Bentham, whose clear and powerful mind saw and pointed out the evils incident to the system, and the wrong of letting the foundations of a new colony be laid by a criminal population. Signor Scalia's judgment is against transportation, and he records how strongly many of the most enlightened and worthy men of the country—Mackintosh, Brongham, and others—protested against it, through the whole period during which the Government—"yielding to selfish considerations"—adopted it. "Justice," he writes, "has now won the day; it is recognised that as for individuals so for nations, it is unwarrantable to seek relief from their own burdens by casting them on others." Bentham proposed the construction of a prison for convicts on a plan which was to some extent adopted in the building of Millbank Prison, the object being that the governor from his place in the centre should have under his eye the cells arranged around it.

To write a full history of Prison Reform, pointing out the causes which led to the various improvements, would involve, as Signor Scalia justly remarks, a history of civilisation in England. It is quite beyond the limits of this review to note even the most important steps in the progress. The reaction from the horrors of mixing criminals together, and shutting them up unemployed, led to the experiment of the silent system, solitary confinement, and the enforcing of even unremunerative labour. Experience soon showed that lengthened isolation endangered the mind; the "mixed" system now prevails, and industrial labour is carried on by the convicts.

Our present plan, as explained by Colonel Du Cane in his paper prepared for the Prison Congress held in London in 1872, is the following: If a prisoner be sentenced to a short term, he is sent to a county or borough gaol managed by local magistrates; if sentenced to penal servitude, he goes to the convict prison of Pentonville or to that of Millbank, in one of which he passes the first part of his term—viz., nine months—in solitude and with labour. He is then removed for the second term to a prison where he is employed in public works, farming, clearing, and reclaiming land, as at Dartmoor—quarrying work, as in Portland Prison. He works in association, but sleeps and eats alone. During the third term he is conditionally released from prison, but kept under the supervision of the police. The system of marks devised by Captain Maconochie—a name, writes Signor Scalia, which will ever be dear to the students of prison reform—is adopted to this extent: every man has to earn a certain number of marks: if earned at the lowest rate, he serves out the whole of his sentence; if at the highest, one-fourth of the time is remitted. The good results of the present system may be seen from the following statistics furnished by Colonel Du Cane:—

The average of sentences to penal servitude for the five years ending in 1859	3.042
The actual number in 1871	1.818

Signor Scalia describes at some length, and with evident sympathy and interest, the system proposed by Captain Maconochie,* which was introduced into and carried out to a great extent in Ireland by Sir Walter Crofton, and which now, as stated above, forms part of our own English system. The fact from which Captain Maconochie started, and which he said was generally admitted at the time he wrote—1846—was that "the punishments then used, resembling as they did everything most deteriorating in ordinary life, did deteriorate the prisoners, and were directly opposed to those forms of adversity which, under Providence, reform character and invigorate it." Every condition, he maintained, which leaves no choice of action, affords no stimulus to exertion, deteriorates the man. "What improves is a condition of adversity from which there is no escape but by continuous effort and something more—prudence, self-command," &c. He proposed that labour, instead of time, should measure the sentence; the labour to be done being represented by marks, misconduct punished by fines in them, the balance carried to the account towards liberation. He believed that "there is more virtue in hard labour, stimulated so as to be willingly performed, than in almost all other penal agencies put together." Archbishop Whately warmly approved the mark system, and wrote to Earl Grey a letter in its favour which is quoted by Signor Scalia. "Criminals," he said, "would then attach an agreeable idea to labour. Each additional step they took on the treadmill, they would be walking out of prison;

* It is computed that "the time of life to which the greatest amount of crime falls is between fifteen and twenty years of age. The sum of crime at that period being nearly a quarter of the whole."—See *Juvenile Crime*, by S. P. Day, 1858.

* *Crime and Punishment: the Mark System*. By Captain Maconochie, late Superintendent of Norfolk Island. (London, 1846.) A small volume of only seventy-two pages, and well worth reading.

by each additional cut of the spade, they would be cutting a way to return to society."

From the time when these ideas were brought before the public, a change in the character of the punishments used in our prisons gradually took place—a change which originated, as Signor Scalia points out, in the recognition of the moral nature of man. From dealing with him as a brute, we have passed on to a system humane, intelligent, and just. We aim at surrounding the prisoner, as Captain Maconochie expresses it, "with motives as well as with walls." "The prison is no longer a grave for the living, writes Signor Scalia,—it is transformed instead into a place in which beings dead to virtue may begin a new life."

MARY E. MAYO.

Leaves of Grass. (Washington.) (London: Chatto & Windus.)

SEVERAL years have now passed since Walt Whitman's poetical works and claims were first brought before the notice of Englishmen of letters, yet it is more than doubtful whether, even among this class, there is any clear and decided view of his merits to be found prevailing. His poems have suffered the usual fate of such abnormal productions; it has been considered that admiration of them must be a kind of voluntary eccentricity, a gratuitous flourish in the face of respectability and orthodoxy. And it cannot be denied that he has not altogether escaped that worst of all calamities to a literary man, the admiration of the incompetent. It is true that he has been praised, with discrimination as well as with emphasis, by Mr. Swinburne; but unfortunately Mr. Swinburne's praise is mainly a passport to the favour of those who would be likely to appreciate Whitman without any passport at all. The testimony of his other panegyrists has been not a little weakened: in some by supposed national or political prejudices; in others, as already mentioned, by notorious literary incompetence.

It is very much to be hoped that the publication of this new edition of the '*Leaves of Grass*' may be the occasion of a deeper and wider study of the American poet, a study which may be carried on purely as a matter of literature, and not with any lurking intention to illustrate preconceived ideas as to the merits or demerits of Walt Whitman's principles, practice, or mode of expression.

The volume now before us is very different in outward appearance from the edition of fourteen years ago, which has so long caught the eye by its dissimilarity to its brother occupants of the bookshelf. The old cloth boards, deeply and mystically stamped with strange emblems, have given way to an outer coat of sober and decent green suitable to any modern English poem. Thick paper and bold type have yielded to the exigencies of increased matter. The very titles of some of the poems have made concessions to conventionality. "*Enfants d'Adam*" have transplanted themselves into plain English; "*Proto-Leaf*" has disappeared from the contents; and "*A Boston Ballad* the 78th year T. S.," which used to excite vague and uncomfortable chronological uncertainties, has

become, to the great solace of the reader, "*A Boston Ballad*, 1854." Altogether the book might seem to a too-fanciful critic to have abandoned, at least in externals, its former air of youthful and exuberant provocation, and to demand, more soberly if not less confidently, the maturer consideration of the student of letters.

But it is still as ever far more easy to argue for or against the book than to convey a clear account of it to persons not acquainted with it. Although the contents are divided and subdivided by the headings which the author has prefixed, yet these headings convey but little idea of what comes under them, sometimes indeed have very little reference to it. Nor is the connection of the different divisions of the work and their interdependence more obvious. It may be easy to explain the meaning of "*Children of Adam*," of "*Passage to India*," and some others; but what shall we make of "*Calamus*," or of '*Leaves of Grass*' itself? For the answers we must refer the reader to the book that it may give its own reply.

Moreover, the poet has in this edition availed himself of the incorporation of "*Drum-taps*" and other recently published matter, to dispose the whole contents of the volume in a new order, and to make many additions, alterations, and transpositions in individual poems. These changes are for the most part, as it appears to us, decided improvements, and the whole work possesses at present a unity and a completeness which are no small advantage. There are few poets who require to be studied as a whole so much as Walt Whitman—quotations and even tolerably extensive selections will not do—and it is a great gain to be directed by the author himself as to the order in which he would have us conduct the study.

It is not difficult to point out the central thesis of Walt Whitman's poetical gospel. It is briefly this: the necessity of the establishment of a universal republic, or rather brotherhood of men. And to this is closely joined another, or rather a series of others, indicating the type of man of which this universal republic is to consist, or perhaps which it is to produce. The poet's language in treating the former of these two positions is not entirely uniform; sometimes he speaks as of a federation of nations, sometimes as if mankind at large were to gravitate towards the United States, and to find in them the desired Utopia. But the constitution of the United States, at least that constitution as it ought to be, is always and uniformly represented as a sufficient and the only sufficient political means of attaining this Utopia, nay, as having to some extent already presented Utopia as a fact. Moreover, passing to the second point, the ideal man is imaged as the ideal Yankee, understanding that word of course as it is understood in America, not in Europe. He is to be a rather magnificent animal, almost entirely uncultured (this is not an unfair representation, although there are to be found certain vague panegyrics on art, and especially on music), possessing a perfect *physique*, well nourished and clothed, affectionate towards his kind, and above all things firmly resolved to admit no superior. As is the ideal man, so is the ideal woman to be. Now it may be admitted frankly and at

once, that this is neither the creed nor the man likely to prove attractive to many persons east of the Atlantic. If it be said that the creed is a vague creed, and the man a detestable man, there will be very little answer attempted. Many wonderful things will doubtless happen "when," as the poet says, "through these States walk a hundred millions of superb persons;" but it must be allowed that there is small prospect of any such procession. One is inclined for very many sound reasons, and after discarding all prejudices, to opine that whatever salvation may await the world may possibly come from quarters other than from America. Fortunately, however, admiration for a creed is easily separable from admiration for the utterance and expression of that creed, and Walt Whitman as a poet is not difficult to disengage from Walt Whitman as an evangelist and politician. The keyword of all his ideas and of all his writings is universality. His Utopia is one which shall be open to everybody; his ideal of man and woman one which shall be attainable by everybody; his favourite scenes, ideas, subjects, those which everybody, at least to some extent, can enjoy and appreciate. He cares not that by this limitation he may exclude thoughts and feelings, at any rate phases of thought and feeling, infinitely choicer and higher than any which he admits. To express this striving after universality he has recourse to methods both unusual and (to most readers) unwelcome. The extraordinary jumbles and strings of names, places, employments, which deface his pages, and which have encouraged the profane to liken them to auctioneers' catalogues or indexes of encyclopædias, have no other object than to express this universal sympathy, reaching to the highest and penetrating to the lowest forms of life. The exclusion of culture, philosophy, manners, is owing also to this desire to admit nothing but what is open to every human being of ordinary faculty and opportunities. Moreover it is to this that we may fairly trace the prominence in Whitman's writings of the sexual passion, a prominence which has given rise, and probably will yet give rise, to much unphilosophical hubbub. This passion, as the poet has no doubt observed, is almost the only one which is peculiar to man as man, the presence of which denotes virility if not humanity, the absence of which is a sign of abnormal temperament. Hence he elevates it to almost the principal place, and treats of it in a manner somewhat shocking to those who are accustomed to speak of such subjects (we owe the word to Southey) *enfarinhadamente*. As a matter of fact, however, the treatment, though outspoken, is eminently "clean," to use the poet's own word; there is not a vestige of prurient thought, not a syllable of prurient language. Yet it would be a great mistake to suppose that sexual passion occupies the chief place in Whitman's estimation. There is according to him something above it, something which in any ecstasies he fails not to realize, something which seems more intimately connected in his mind with the welfare of mankind, and the promotion of his ideal republic. This is what he calls "robust American love." He is never tired of repeating "I am the poet of comrades"—

Socrates himself seems renescent in this apostle of friendship. In the ears of a world (at least on this side the Atlantic) incredulous of such things, he reiterates the expressions of Plato to Aster, of Socrates respecting Charmides, and in this respect fully justifies (making allowance for altered manners) Mr. Symonds' assertion of his essentially Greek character, an assertion which most students of Whitman will heartily endorse. But we must again repeat that it is not so much in the matter as in the manner of his Evangel that the strength of Whitman lies. It is impossible not to notice his exquisite descriptive faculty, and his singular felicity in its use. Forced as he is, both by natural inclination and in the carrying out of his main idea, to take note of "the actual earth's equalities," he has literally filled his pages with the song of birds, the hushed murmur of waves, the quiet and multiform life of the forest and the meadow. And in these descriptions he succeeds in doing what is most difficult, in giving us the actual scene or circumstance as it impressed him, and not merely the impression itself. This is what none but the greatest poets have ever save by accident done, and what Whitman does constantly and with a sure hand. "You shall," he says at the beginning of his book:

"You shall no longer take things at second or third hand, nor look through the eyes of the dead, nor feed on the spectres in books:

"You shall not look through my eyes either, nor take things from me:

"You shall listen to all sides and filter them from yourself."

But affluent as his descriptions are, there are two subjects on which he is especially eloquent, which seem indeed to intoxicate and inspire him the moment he approaches them. These are Death and the sea. In the latter respect he is not, indeed, peculiar, but accords with all poets of all times, and especially of this time. But in his connection of the two ideas (for the one always seems to suggest the other to him), and in his special devotion to Death, he is more singular. The combined influence of the two has produced what is certainly the most perfect specimen of his work, the "Word out of the Sea" (in this edition it has, we are sorry to see, lost its special title, and become the first merely of "Sea-Shore Memories"). Unfortunately it is indivisible, and its length precludes the possibility of quotation. But there is another poem almost equally beautiful, which forms part of "President Lincoln's Burial Hymn," and for this space may perhaps be found:—

"DEATH-CAROL.

Come, lovely and soothing Death,
Undulate round the world serenely arriving, arriving,
In the day, in the night, to all, to each,
Sooner or later, delicate Death.

Prais'd be the fathomless universe,
For life and joy, and for objects and knowledge curious;
And for love, sweet love. But praise! praise! praise!
For the sure-enwinding arms of cool-enfolding Death.

Dark Mother, always gliding near, with soft feet,
Have none chanted for thee a chant of fullest welcome?

Then I chant it for thee—I glorify thee above all;
I bring thee a song that when thou must indeed come,
come unfalteringly.

Approach, strong Deliveress!

When it is so—when thou hast taken them, I joyously
sing the dead,
Lost in the loving, floating ocean of thee,
Laved in the flood of thy bliss, O Death.

From me to thee glad serenades,
Dances for thee I propose, saluting thee—adornments
and feastings for thee;
And the sights of the open landscape and the high
spread sky are fitting,
And life and the fields and the huge and thoughtful
night.

The night, in silence under many a star;
The ocean-shore, and the husky whispering wave
whose voice I know;
And the soul turning to thee, O vast and well-veiled
death,
And the body gratefully nestling close to thee.

Over the tree-tops I float thee a song!
Over the rising and sinking waves—over the myriad
fields and the prairies wide;
Over the dense-packed cities all and the teeming
wharves and ways,
I float this carol with joy, with joy to thee, O Death!"

It is easy enough to connect this cultus of Death, and the pantheism which necessarily accompanies it, with the main articles of Whitman's creed. Death is viewed as the one event of great solemnity and importance which is common to all—the one inevitable, yet not commonplace incident in every life, however commonplace; and, further, it must not be overlooked that Death is pre-eminently valuable in such a system as this, in the capacity of reconciler, ready to accommodate all difficulties, to sweep away all rubbish. The cheeriest of optimists with the lowest of standards cannot pretend to assert or expect that everyone will live the ideal life—but Death pays all scores and obliterates all mistakes.

There remains, however, still to be considered a point not least in importance—the vehicle which Whitman has chosen for the conveyance of these thoughts. He employs, as most people know who know anything at all about him, neither rhyme nor even regular metre; the exceptions to this rule occurring among his more recent poems are few and insignificant. A page of his work has little or no look of poetry about it; it is not, indeed, printed continuously, but it consists of versicles, often less in extent than a line, sometimes extending to many lines. Only after reading these for some time does it become apparent that, though rhyme and metre have been abandoned, rhythm has not; and, moreover, that certain figures and tricks of language occur which are generally considered more appropriate to poetry than to prose. The total effect produced is dissimilar to that of any of the various attempts which have been made to evade the shackles of metre and rhyme, while retaining the other advantages of poetical form and diction. Whitman's style differs very much from that of such efforts as Baudelaire's 'Petits Poèmes en Prose,' for from these all rhythm, diction, and so forth not strictly appropriate to prose is conscientiously excluded. It is more like the polymeters of the poet's namesake Walt in Richter's 'Flegeljahre,' except that these latter being limited to the expression of a single thought are not divided into separate limbs or verses. Perhaps the likeness which is presented to the mind most strongly, is that which exists between our author and the verse divisions of the English Bible, es-

pecially in the poetical books, and it is not unlikely that the latter did actually exercise some influence in moulding the poet's work. It is hard to give a fair specimen of it in the way of quotation—that already given is not representative, being too avowedly lyrical—and the rhythm is as a rule too varying, complex, and subtle to be readily seized except from a comparison of many instances. Perhaps, however, the following stanza from "Children of Adam" may convey some idea of it:—

"I have perceived that to be with those I like is enough;

To stop in company with the rest at evening is enough;

To be surrounded by beautiful, curious, breathing, laughing flesh is enough;

To pass among them, or touch any one, or rest my arm ever so lightly round his or her neck for a moment—what is this then?

I do not ask any more delight—I swim in it as in a sea.

There is something in staying close to men and women, and looking on them, and in the contact and odour of them, that pleases the soul well;

All things please the soul—but these please the soul well."

It will be observed that the rhythm is many-centred, that it takes fresh departures as it goes on. The poet uses freely alliteration, chiasmus, antithesis, and especially the retention of the same word or words to begin and end successive lines, but none of these so freely as to render it characteristic. The result, though perhaps uncouth at first sight and hearing, is a medium of expression by no means wanting in excellence, and certainly well adapted for Whitman's purposes. Strange as it appears to a reader familiarised with the exquisite versification of modern England or France, it is by no means in disagreeable contrast therewith, being at least in its earlier forms (for in some of the later poems reminiscences of the English heroic, of Longfellow's hexameters, and even of Poe's stanzas occur) singularly fresh, light, and vigorous. Nor should the language pass unmentioned—for though of course somewhat Transatlantic in construction and vocabulary, it is not offensively American. The chief blemish in the eyes of a sensitive critic is an ugly trick of using foreign words, such as "Libertad" for liberty, "habitan of the Alleghanies," "to become élève of mine," "with reference to ensemble," and so forth; but even this does not occur very frequently. Few books abound more in "jewels five words long;" it is hardly possible to open a page without lighting upon some happy and memorable conceit, expression, thought, such as this of the grass:

"It is the handkerchief of the Lord;
A scented gift and remembrance designedly dropt,
Bearing the owner's name someway in the corners,
that we may see and remark, and say Whose?"

Or this of children's love to a father:

"They did not love him by allowance, they loved him
with personal love."

Or again of the grass:

"And now it seems to me the beautiful uncut hair of graves."

Such in matter and in manner are Walt Whitman's 'Leaves of Grass,' and there only remains to be added one recommendation to their study. The book, aggressive and vain-glorious as it seems, is in reality remarkably

free from vituperativeness of tone. Hardly to some "eunuchs, consumptive and genteel persons" is strong language used, and after all it rests with every reader whether he chooses to class himself with these. Amid all the ecstatic praise of America there is no abuse of England; amid all the excitement of the poems on the War there is little personal abuse of the Secessionists. No Englishman, no one indeed, whether American or Englishman, need be deterred from reading this book, a book the most unquestionable in originality, if not the most unquestioned in excellence, that the United States have yet sent us. GEORGE SAINTSBURY.

A Dialogue describing the orgynall ground of these Lutheran faccyons, and many of theyr abusys, compiled by syr Wylliam Barlow, chanon. 28 July, 1531. printed by W. Rastell with privilege for 7 years.

A GREAT deal has lately been said about the scoundrel who wrote this book, in relation to the controversy about the succession of the Anglican Episcopate. He was the principal consecrator of Matthew Parker, who, upon the death of Cardinal Pole, was appointed by Elizabeth to succeed him in the see of Canterbury. Probably all that can be said as regards the doubt that has been thrown upon his own consecration to the office of a bishop has already been said, and it is needless to say anything of the character of the man as affecting his own consecration, or that of Parker. What we are concerned with now, is the very scarce, and perhaps unique copy of the work the title of which has been placed at the head of this article. It was reprinted in 1553, and Strype may certainly be excused for not having seen the original edition, though it perhaps was not so scarce in his day as it has become now; but if he had read the reprint of 1553, he might probably have found out that it was not written, as he supposed, in that year, and that when Barlow's friend, Dr. Turner, accused Gardiner of showing up Barlow, "which wrote a naughty and a false lying book, compelled for fear to do so" (*Eccles. Mem.* iii. 153), he meant that Gardiner had republished Barlow's reasons for returning from Lutheranism, partly to expose the tenets of Luther and Zwingli, by the description of one who knew them well, and partly to discredit Barlow himself for having become a Lutheran, returned to Catholicism, and then having adopted the Zwinglian form of religion established by Edward. He afterwards offered to conform under Mary, and finally relapsed into Calvinism. Burnet, who had read, or partially read the book, considers it a forgery put out in Barlow's name to disgrace the Reformation, being, as he alleges, one of the most virulent invectives against the Reformation that was written at that time.

That Strype and Burnet were altogether in the wrong in their assertions and conjectures, is proved by the actual existence of a copy of the original edition of the *Dyaloge* with its date, July 28, 1531, and the name of its printer on the last leaf, in the Bodleian Library. Whether there is any other copy we do not know—there is none in the British Museum or at Lambeth; but possibly this

notice may elicit tidings of some other copy. The edition of 1553 is described by various writers, and is probably common. It is reprinted *verbatim* but not *literatim*; both are in black letter and of very small size; the lines of the latter occasionally conforming to those of the earlier edition, as if they had been printed from the same type; but the variations both of spelling and arrangement of type are so great as to enable any one to decide, from comparing a single leaf of the two copies, that they are two distinct editions. The only additions to be found in the second issue are the insertion on the title-page, after Barlow's name, of his designation, as "late Bishop of Bathe;" and a leaf which contains a preface, the first sentence of which is here transcribed as a specimen of the whole. It runs as follows:—

"In this present treatise following (gentle reader) is not only uttered and disclosed the beastly beginning of Luther's furious faction in Saxony, with the seditious scismes of the sacramentaries, Swynglius, Oecolampadius, and other of Swyzerlande, but also very plainly here is shewed their monstrous manners and mutability, their cankered contentions and horrible ipocrisy, their devilish devices and bitter blasphemy, with infinite like reliques of that railing religion; whereby the Christian reader shall right well perceive what filthy fruit buddeth out of this frantic fraternity and sinful synagogue of Satan infernally invented to seduce simple souls."

Who the writer of the preface is, it is not easy to determine. Whoever he was, he outdoes even John Bale, the scurrilous Bishop of Ossory, in his power of finding alliterative epithets of abuse. About a year after its publication, Barlow and Cardmaker were sent to the Fleet prison; Cardmaker was afterwards burnt for obstinate adherence to his opinions. Barlow acted successfully on the principle that "He who fights and runs away, will live to fight another day." He lived, as the reader knows, to play an important part in ecclesiastical matters at the commencement of Elizabeth's reign; and perhaps no turn-coat of that day feathered his nest so completely as the man who, in defiance of the vow of celibacy which he had taken as an Austin canon, married in the face of the Act of the Six Articles, and subsequently got the four daughters, who were the fruit of the marriage, married to four of the Elizabethan bishops.

What has been said of these two editions, then, is not merely a curious piece of bibliography, but it is of historical importance, as it fixes the number of times that Barlow changed his religious profession. He began by being a Catholic, and in June, 1531, had, after joining the Lutherans, become a Catholic again. Under Henry the Eighth he was promoted to the bishopric of St. Asaph and thence translated to St. Davids. In Edward the Sixth's reign he was translated to Bath and Wells, as being a Protestant of the Zwinglian school, who could quite be depended on. In Mary's reign he offered to conform, and though he submitted to the republication of his treatise against Luther and Oecolampadius, he failed to regain his bishopric, and went beyond sea, where he remained till the accession of Elizabeth, when he appears again on the scene as a full-blown Protestant, and was made bishop of Chichester. Nothing more was

to be gained either by hypocrisy or servility; but he held his own, and died at a very advanced age, having obtained as much of this world's goods for himself and his family as in his most sanguine expectations he could ever have hoped for.

But we have not yet touched upon the contents of the book, which, after all, are very curious and well worth reading. It is in the form of a dialogue between Nycholas, who is inclined toward Lutheranism, and Wylliam, *i.e.* Barlow himself, who has been a convert to their tenets, and, having seen the mischief of their doctrines and the wickedness of their lives, has returned to the true faith. The argument conducted between the two interlocutors is chiefly valuable as it shows how, as early as 1531, the idea of adopting Scripture interpreted by each individual for himself had carried people far beyond what has since been called Lutheranism. Though no credit can be given to its author for sincerity of belief in what he professes, he is an undoubted authority as to the amount of the development of Protestantism at the time of his writing; and it is plain that the form of religion he had fallen in with, both at home and abroad, much more resembled Calvinism than the tenets professed by Luther and his followers. When, therefore, the author uses the words—

"I mean not that fleshly word, nor their gospel which say, ye have no free will, your good deeds shall not save you, nor your ill deeds shall not damn you, the sacraments of the church be nothing of necessity, ye need not to be confessed to a priest, ye are not bound to obey the laws of the church," &c.,

he is plainly describing an existing state of belief which Luther, in 1531, would not have adopted, and offering a substantial contribution in proof of what has only lately begun to dawn on the minds of English readers of history, that Lutheranism never had any hold on the religious mind of England, but that the reading of Tyndale's translation of the New Testament had already borne ample fruit in the propagation of what was afterwards designated Calvinism.

The professors of these opinions were indeed roughly classed as "Lutherians" in the indictments laid against them, and Barlow heads his tract with the title of *Lutheran Faccyons*, because he looked upon Luther as the origin of all the numerous sects that had already sprung up. But he was perfectly well acquainted both with their varieties of opinion and their internecine quarrels, as the volume itself sufficiently shows; and he makes use of their differences—which, perhaps, he somewhat exaggerates—as an argument against their teaching. We may believe that there were many sects of Anabaptists, without assenting to the exact number of forty which he assigns; and when he speaks of three hundred different sects in Germany, he probably alludes to the variety of opinions he had met with in individuals who were classed by the world in general under the head of Lutherans, Oecolampadians, and Zwinglians. One thing is remarkable, that whereas the name of Zwingli has survived, while that of Oecolampadius is only known to the learned, Barlow

seems to speak of the latter as of more importance than the well-known "Bishop of Zurich." And, unquestionably, his testimony to the irreproachable life and morals of many of the Anabaptists is unimpeachable, for it was his interest at that time to run them down as much as he does those whom he calls Lutherans and Oecolampadians, who were described by these Anabaptists "as worse than the clergy whom they call Papists, for because they have the gospel in their mouths, and frame their lives nothing thereafter, showing none amendment of their lewd conversation, but continue still in vicious excesses after the common rate of mis-believers."

This enumeration which follows of their errors of belief and practice is interesting as coming from an ear- and eye-witness:—

"There be some which hold opinion that all devils and damned souls shall be saved at the day of doom. Some of them persuade that the serpent which deceived Eve was Christ. Some of them grant to every man and woman two souls. Some affirm lechery to be no sin, and that one may use another man's wife without offence. Some take upon them to be soothsayers and prophets of wonderful things to come, and have prophesied the day of judgment to be at hand, some within three months, some within one month, some within six days. Some of them, both men and women, at their congregation for a mystery shew themselves naked, affirming that they be in the state of innocence. Also, some hold that no man ought to be punished or suffer execution for any crime or trespass, be it ever so horrible."

The description of what Barlow professes to have seen, first in Saxony and afterwards in Switzerland, among Zwinglians and Anabaptists, is of the highest interest. And it is remarkable that many of the obscure facts of history which he mentions are either borne out by narratives of other historians which nearly resemble them, or, at least, are not inconsistent with them. Neither is it likely that the charges which he brings against so many of the Protestant party are altogether groundless, because they were made at a time when it would have been easy to contradict them if they had been false. Thus, the death of the reformer, Ulric Hutten, in Switzerland, by a loathsome disease contracted by his profligacy, is matter of history, though it has been entirely ignored by his Protestant biographers. Barlow caps the story by saying that he had previously been cured of the same disease seven times.

With regard to himself Barlow takes care to notice the charges of insincerity and affections to worldly interest which would be laid at his door, and alleges that what he had done in leaving the church was done in ignorance, and that he is thankful that, through God's undeserved mercy, he had been restored. His virulent invective against friars who had gone over to Protestantism, and married one or more wives in violation of their vows of celibacy, is perhaps hardly consistent with his having already himself married, and we need not charge him with this additional piece of lying and hypocrisy; but it is certain he must soon after have taken a wife, though Mrs. Barlow was, of course, cautiously kept in the background during the time when the Six Articles were enforced, and did not

make her appearance till the statute of Edward VI. authorised the marriage of priests, and legitimised their children.

Lastly, there is one other curious point in the volume, considering the date of its publication. In objecting to Tyndale's version of the New Testament, now six years old, as having led to the diffusion of heretical opinions, he expresses a decided opinion against any printing of the Bible in English for the present. He was a mere creature of Cromwell's, and was steering his course in such way as should most ingratiate himself with his new patron. And perhaps this passage contains one of the earliest intimations of the possibility of those in authority consenting, as they did within a few years, to an English translation of the Scriptures.

Upon the whole, we should say that this little work would be well worth reprinting, and we should be glad to see it amongst the other scarce tracts for the republication of which we are indebted to Mr. Arber.

NICHOLAS POCOCK.

MINOR BOOKS.

Queen Jane. An Historical Tragedy, by G. Warren Adams. (London: Effingham Wilson.) This play is rather well-intended than well-conceived or executed. The author fails not for want of painstaking, or even ingenuity, but for want of a sufficiently high tone of thinking and feeling: it gives the measure of his whole unfitness to dramatise the story of Lady Jane Grey, that he finds the fundamental tragedy of her life in the fact that Guildford was not like the late Prince Consort.

Philosophers and Fools. By J. Duhring. (London: Triibner & Co.) Miss Duhring, in her volume of essays, has done about as much to solve the practical perplexities of the nineteenth century as the *Rambler* did to solve those of the eighteenth. It goes without saying that she does not write as well or as weightily as Dr. Johnson; but she is well-read, sprightly and sensible, and has something of the ponderous Doctor's talent for gravitating towards helpful commonplaces. Of course any talent of this kind is proportionately more commendable in an age of shifting standpoints like ours, than in an age of fixed convictions like Dr. Johnson's.

Principles of Pantheistic and Atheistic Philosophy. By the Rev. W. Row. (London: Robert Hardwicke.) Prebendary Row's pamphlet, which was originally addressed to the members of the Victoria Institute, is mainly taken up with a reply to the last work of Strauss. Where the writer succeeds best is in showing that Strauss fails as completely as his predecessors in the attempt to construct a subjective synthesis of knowledge which will bear comparison with the traditional synthesis; and as the attempt is never abandoned, every failure is an argument against tendencies which issue in such a result. On the other hand, in dealing with middle principles, the writer is apt to be too stiff in maintaining up to the last moment positions which have been already turned.

Canons of the Church of England. By M. E. C. Walcott. (Oxford and London: Parker & Co.) Prebendary Walcott has illustrated the Canons of 1604, by copious references to sources of ecclesiastical law of an earlier date, with the general object of making the history of the English Church look as continuous as possible. In his Introduction he points out interesting coincidences between the Anglican canons and those passed by Cardinal Borromeo in four provincial councils of Milan. Both the Introduction and the Notes contain a good deal of curious information not very accessible to an indolent reader, but a quotation from

Lyndwoode or Othobon gives an indolent reader no idea of the antiquity of the particular bit of law re-enacted in 1604.

The Hero of Elstow. By the Rev. J. Copner. (Hodder & Stoughton.) The hero of Elstow is John Bunyan, and Mr. Copner is vicar of the parish, and would like his church restored in honour of the illustrious parishioner whose life he has written in a more sensible manner than we should have expected from his title. The few facts known about Bunyan are given clearly and unaffectedly; and this is no small merit, considering the temptations to rhapsodise both about the conversion and the imprisonment.

A Lay to the Last Minstrel. By G. C. Norton. (London: John Murray.) The author of *Lays of Faith and Loyalty* visited Scott's grave in 1860, and was inspired with some very graceful stanzas, setting forth what an accomplished clerical romanticist thought were Scott's titles to immortality. They are published now "to guard a title which was rich before," with a preface to explain the writer's disgust at the one-sided emphasis with which recent criticism has dwelt upon the hearty industry whereby Scott utilised his inspiration in pursuit of aspirations after all not too unpractical to be romantic.

The Shakespeare Argosy. By Capt. A. F. P. Harcourt. (London: H. S. King & Co.) Captain Harcourt has read Shakespeare through in search of quotable things, and marked in the margin some word that he thought supplied a suitable heading for each quotation, and has arranged the quotations under these headings in their alphabetical order: he hopes that his compilation may not only be useful to diners-out in want of quotations, but may contain enough of Shakespeare's wit and wisdom to repay disinterested study. The selection is about as good as might be expected from the plan.

The Golden Treasury of Thought. (Chatto & Windus). *Other Men's Minds.* By G. Davies. (Warne & Co.) The first of these collections is perhaps the most select; the latter is embellished (?) by several plates of steel portraits. Both proceed upon the same plan: distinguished and undistinguished writers, from Sallust to Sala, from George Eliot and Renan to Henry Ward Beecher, are ransacked for quotations which will come home to commonplace readers. Either collection is fitted to supply the secular reading of the class which used to resort for spiritual sustenance to Bogatzky.

The Earth and its Story. By Frances Pimm. (London: Whittaker, 1874.) The poem before us is written somewhat "after" *Paradise Regained*. It is a composition in "unrimed" decasyllabic verse, and appears to form a part of a whole which has not yet been given to the world, for its heading "Book V.," would lead us to suppose that four other books are to come at some future time. The authoress possesses a considerable power of versifying, that is, her metre and (in the Prologue) "rimes" are good. The chief faults are diffuseness and sameness in the use of epithets, a certain ungainliness in the breaking-up of sentences into lines, and occasional perversions of English. We are only speaking of the form: of the matter perhaps the less said the better. There is a total absence of real thought in the poem. Its subject—the Rise of Christianity—is treated from the narrowest traditional standpoint. Yet here and there we meet with bits of no little grace, and some of the thoughts, though never profound, evince originality, and seem to promise something better. But Miss Pimm is not equal to her subject, which in its scope far out-reaches both the *Paradises* of Milton put together and needs another Milton to tell it. She may do something in lighter verse: but to begin with a sort of epic (of which the fifth Book alone contains 1,200 lines) is an inversion of a poet's, still more a poetaster's course.

The Heart's Great Rulers. By N. Michell. (London: Sampson Low & Co.) Mr. Michell is a business-like, hard-working, not unsuccessful poetaster. His work bears about the same resemblance to poetry that a panorama bears to painting; the emphatic passages are daubed, the intermediate passages are blurred, and yet we get something of a general effect, perhaps even something of a sense that the workman felt his subject better than he rendered it. The work which gives a title to Mr. Michell's last volume is something between a poem on the passions, with illustrative tales, and a series of tales with introductory stanzas.

Poems. By A. C. Shaw. (Redruth: F. Treaskis, 1874.) Contains one or two pretty thoughts and much crude ambition.

The Angel of Love, and other Poems. By Zero. (Birmingham: Corn, Rylett & Mee, 1874.) "The Angel of Love" makes us regret that the custom of recitation has gone out; it would be exactly the proper publication of these pleasant stanzas, to be read aloud once some fair May Sunday to a congregation of fair souls. The framework of the poem is something like that of the "Paradiso;" several stanzas are as pretty as this:—

"Then straight before a mighty wall of green
Sunk in a valley, we delighted stood;
And oh! the soothing solace of the scene
After the lustre we had passed, was good!
More than delight!—it was an emerald rest
With sweet faint visions of flower fancies blest."

Bubbles from the Deep. By A. Greaves. (Dean & Co.) The bubbles consist of 205 sonnets in the metre of Shakespeare's, and on the same class of subject—they are rather empty and rather tawdry; and some dozen miscellaneous poems, most of which savour of the imbecile romanticism of the last quarter of the eighteenth century. One, which is called "Mother Monkford's Meeting," is not so bad: it is a quasi-dramatic idyll, in which a lot of girls consult an old crone about their fate in love.

Poems and Sonnets. By B. Johnson. (Simpkin, Marshall & Co.) This volume gives one the impression of a few feeble thoughts and fancies floating in a matrix of real poetical sentiment, but not crystallised yet, or apparently likely to crystallise.

Ich Dien. (London: Moxon, Son & Co.) A blank verse sermon to the Prince of Wales.

A String of Pearls. By W. Watkins Old. (Bemrose & Sons.) This is rather a depressing book: the writer has aimed high, and his workmanship, though not quite faultless, is always thorough, finished, and even delicate. It cannot be said that he is a mere imitator; it is even possible he might have written better in a time when better verse than his own was scarcer; his inspiration is his own, what there is of it; only there is not enough. It might be worth the while of a future Ste. Beuve to explore his circumstances and analyse his character, in order to explain the shortcomings of a talent which, in its present state, is like an apple of a fine stock which has ripened without growing to its full size, though there is no trace of anything that wounded it. In the meantime, readers who see the book in a shop had better read "A Life" at page 8, and "A Student" at page 20.

The Soul Speaks, and other Poems. By F. H. Hemery. (Tinsley.) The writer has "noticed that readable poems at a small price cannot be obtained by the general public." His poems are certainly readable, they have a sort of amplitude and sonorousness which makes one regret the absence of anything rare or special in their substance. He has a natural ear for rhythm, but his metre is often incorrect: technical study would cure this. If he is capable of precise thought, it might enrich the content of his poems to read what he found stimulating, and refuse to rest in vague excitement.

Wayside Wells, or Thoughts from Deepdale. By A. Lamont. (London: Hodder, & Stoughton.) This is a collection of warm-hearted essays and sketches which would be read with pleasure by the large public which reads A. K. H. B. and the *Gentle Life* with admiration. Readers outside that circle will be puzzled whether to find the author silly, tedious, or pleasant.

Eleanor Gone with the Storm, and other poems. By Charlotte M. Griffiths. (Longley.) This very prettily illustrated volume is in the nature of a "survival." It should have been published when Mrs. Hemans was the greatest living poetess. Eleanor is a beautiful girl, whose pious boldness goes beyond the *Gates Ajar*. *Gone with the Storm* is a story that might do for the framework of a Surrey drama, about a persecuted sailor whose baby dies, when his innocence is made clear. The last five lines are pretty:—

"God sent the little sunbeam through the clouds
To cheer a lone sad heart; but now the storm
Was over, and the black clouds chased away,
Glad sunshine lit up all around; but this
One little beam God gathered back to heaven."

EDITOR.

NOTES AND NEWS.

MR. F. B. PEACOCK, of Bottesford Manor, Brigg, Lincolnshire, is hard at work on his *Lincolnshire Glossary* for the English Dialect Society.

DR. RICHARD MORRIS is about to re-edit, for English schools and colleges, the comparative part of Professor W. D. Whitney's work on *Language* separately, with an introduction, notes, and comparative tables by himself.

THE second edition of the third volume of Conington's *Virgil* ("Commentary on *Aeneid*," x.-xii.) will be soon brought out by Mr. H. Nettleship. It will contain a paper on "Madvig's Emendations in *Virgil*," recently published in the second volume of his *Adversaria Critica*, as well as some additional notes, and a list (in the index) of all the passages in the last six books of the *Aeneid*, in which Virgil imitated Ennius, Catullus, and Lucretius.

WE hear that Mrs. Ross Church (Miss Florence Marryat, the writer of novels) is going to give some public readings in the United States.

MESSRS. A. & C. BLACK, of Edinburgh, are preparing for immediate publication an edition, the first complete one, of the works of Edgar Allan Poe. The collection is to be published in four monthly volumes, and will contain a large amount of matter quite unknown to both the English and American publics, and now for the first time collected. Poe's clever papers on "Autography," "Cryptography," and other interesting subjects; his wonderful scientific prose poem *Eureka*; his lengthy romance *Arthur Gordon Pym*, and many other almost unknown productions will be contained in this voluminous edition. An entirely new "Memoir," founded on original matter by John H. Ingram, the editor of the collection, will be prefixed to vol. i. This memoir is written to refute the prevalent idea of Poe's character (as based upon his enemy Griswold's life of him), and will give evidence, collected from the various persons who knew the poet intimately, in favour of the view now taken of his life.

PROFESSOR SEELEY is to give a course of historical lectures to the Ladies' Association at Brighton next term on the State-system of Europe, beginning on Tuesday next. He will also continue his lectures to the Ladies' Classes at Cambridge.

THE French papers say that a posthumous novel by Alexandre Dumas has lately been discovered, and the story is, that it was given as her only portion to an illegitimate child of the author's. For the child's benefit—but she should now be a woman—the novel, they say, is soon to be published.

MR. ABBOTT'S Concordance to Pope's Works is now well forward in the press. It will contain a register of every word and form used in the poet's writings, though it will not give extracts for the commonest words like *and*, *the*. For all other words, every instance of use will be quoted; those for intensions will be put at the end of their crude forms, and when a word like *brick* is used as a verb as well as a noun, the verbal passages will come last in the article.

THE *New York Herald's* discussion on Did Bacon write Shakspeare's Plays? has degenerated into this kind of thing. "Reporter (to the Mayor of New York): 'This article discusses the claims made by Professor Holmes in the interest of Bacon.' Mayor: 'I don't know anything about bacon. I am in the sugar line. . . .'" Reporter: "Do you think this Baconian claim has any foundation?" Mayor: "I haven't studied the subject; I can't say. I might remark that I don't know, and, were I pressed, I would say that I don't care. Shakspeare is good enough for me, and I don't see any good in making a row about it."—*Herald*, Sept. 9, p. 4, col. 3.

HERR ADOLF WOLF has re-edited in Vienna William Royce's *Dialogue between a Christian Father and his stubborn Son*, from the unique copy in the Imperial Library at Vienna. The reprint of this early Reformation tract will be most welcome to English students. Its date must be 1527. Its title is *A lytle Treatous or Dialogue very necessary for all Christian Men to learne and to knowe*; it spells "other" "wother," and is dedicated "To the Right noble Estates, and to all wother of the toune of Cales." Herr A. Wolf has a good Introduction, giving all the facts known about Royce's life, and discussing the book.

AN answer, by Professor Friedrich, to the German Ultramontane journals, who disputed the genuineness of P. Theiner's letters, has appeared in the *Cologne Gazette*. The communication states that a comparison of these letters with others of the Library of the Vatican, has fully established their genuineness.

M. ÉMILE OLLIVIER has been made Chancellor of the Académie Française, and M. Claude Bernard director.

WITH reference to the important discovery of Milton's Common Place Book, noticed in our columns of last week, we are glad to learn that Sir Frederick Graham has given permission for its publication. The work, which will be accompanied by facsimiles of some of the most important pages, will be edited by Mr. A. J. Horwood.

A NEW edition (the 12th) of Brockhaus' *Conversations-Lexicon* is in the press.

THE general meeting of the "Deutsche Schillerstiftung" has just been held at Weimar. The "Schiller-Stiftung" fulfils the double mission of a literary and a charitable institution.

IN the *Atlantic Monthly* for October we may mention a paper of gossip on Mdme. Schumann, Herren, Bülow, Rubinstein, and Tausig. We wonder whether the latter artist has authorised the publication of the impish tricks of his youth. George Cary Eggleston gives some interesting reminiscences of the celebrated Confederate cavalry general, J. E. B. Stuart, entitled "The Chevalier of the Lost Cause." Harriet W. Preston gives an appreciative description of Theodore Aubanel's last volume, interspersed with numerous and creditable translations.

WE regret to learn that serious apprehensions are entertained in regard to the future of the University of Jena, and that in consequence of the great financial difficulties in which it has long been placed, it is feared that it may be necessary to close its lecture-halls and to dismiss its professors. In 1872 the revenues of the university were estimated at 17,000 thaler, a sum which was found

so far inadequate to meet the necessary outlays that extra Government aid had to be sought. The States of Weimar, Meiningen, Altenburg and Coburg-Gotha, of which Jena may be said to be the local University feeder, and whose rulers bear the title of Governors or "Nutritors" of the institution, have since 1865 contributed annually about 34,000 thaler towards its support; and since 1872 they have severally given additional sums for the same purpose, although in very various proportions, Weimar giving 8,000 thaler and Meiningen making a separate grant of 500 thaler. The accounts for 1873, notwithstanding these aids, show a balance of only 100 thaler in favour of the University funds, after all the necessary expenses had been paid. This unfavourable condition of the Jena University finances is certainly not due to excessive liberality in the scale of professional incomes, since we are officially informed that of the twenty-eight professors, twelve alone receive more than 1,000 thaler per annum, the remaining sixteen drawing salaries which vary from 1,000 to 500 thaler. Under these depressing conditions the friends of the University have felt impelled to bring its financial difficulties before the notice of the public, in the hope that the central German States may be induced to take prompt measures for the effectual aid of an institution which has done good service to the cause of science in Germany, and has had no slight influence on the rapid development of culture among Germans of all classes, during the present century.

We are glad to hear that Dr. Brinsley Nicholson has found the author who helped Ben Jonson in the first version of his play of *Sejanus*. This author has been hitherto supposed, even by critics of the best repute, to be Shakspeare; but the notion was ridiculed by Mr. Furnivall at the last meeting of the New Shakspeare Society. Was it likely that a play in which Shakspeare had largely helped Ben Jonson should fail (as it did) while Shakspeare's work was in it, and succeed (as it did) when Ben cut out all the supposed Shakspeare work, and put in his own instead? Of course not. The mere statement of the hypothesis should have refuted it. But as this has not done so, we trust that Dr. Nicholson's discovery—of which we hope soon to give the details—will effectually suppress the prevalent opinion.

ENQUIRIES having been made about the state of Charles and Mary Lamb's tomb in Edmonton churchyard, a correspondent of ours has paid a visit to the grave. He found the plain head and foot stones and the turf-covered grave in good order, as they were set straight, and the inscription repointed, about two years ago, at a cost of two pounds, by order of the editor of a local paper. But no flowers or monument tell of the loving care of any of Lamb's admirers, or those who have been moved by the touching story of his sister's life and his constant affection to her.

AMONG the Essex Poems in Mr. Morfill's forthcoming volume for the Ballad Society will be "A Poem made on the Earle of Essex (being in disgrace with Queene Eliz.) by Mr. Henry Cuffe his Secretary," who was executed on March 13, 1601, and whose dying speech at Tyburn is in the Tanner MS., 76—from the Harleian MS., 6947; an "Elegy on the Earle of Essex," from the Tanner MS., 306, praising his valour and gallant deeds, especially at Cadiz and Lisbon:—

"But at his words they sett but light,
discharging shot at him amaine;
yet ner dismayed our english knight,
but valiantly did still remaine;
drawing his poniard from his side,
wheron a silken scarf he tide.

And on their gate he lefte the same,
returning to his Company:
which deeds be eternized by fame
for noble acts of Cheualry.
Spaine, france and portingall did feele
his fauchions force of tempered steels."

"A Lament for Essex," from Harleian, 6910; his own "Complaint," from MS. Bibl. Reg., 17 B. 1.; and "The Songe of his Honour, songe the nighte before he died," from Harleian, 296, a hymn of repentance and a prayer for grace.

ON the 5th of this month will be re-opened the library of the city of Paris. This library, reconstituted in the Hôtel Carnavalet, Rue de Sévigné, since the burning of the Hôtel de Ville, already numbers above 27,000 volumes, specially relative to the history of Paris, its revolutions, its manners, arts, theatres, and administration. It also possesses an important collection of engravings relating to the topography of old Paris, to the manners, historical events, industrial arts and costume, as well as a series, nearly complete in originals and facsimiles, of the ancient plans of Paris from the sixteenth century.

THE old temple of the Augustines in Mexico has been converted into a national library. It is spoken of as a fine building, ornamented with statues and frescoes by Mexican artists. The library now includes the collections formerly belonging to the dissolved religious corporations, that of the University and that of San Juan de Letian. Near the general library is a smaller one, exclusively for ladies (surely a ridiculous arrangement), and both are surrounded by gardens.

A POPULAR edition of Holtzmann's text of the *Nibelungenlied*, by A. Holder, has just appeared (*Das Nibelungenlied von Holtzmann, Volksausgabe durch A. Holder*. Stuttgart, Metzler, 1874). The text is given without any notes. One of its features deserves praise—the distinction between the two *e's*, which is observed carefully throughout.

HEYNE's well-known revised text of Stamm's *Uffilas* has just reached a sixth edition—a gratifying proof of the popularisation of thorough-going Teutonic philology in Germany. The only alteration in the present edition consists in the addition of the two documents of Naples and Arezzo, of which only specimens were given in the earlier editions.

CONSIDERING the pitch of excitement to which Italy attuned itself to commemorate the sixth centenary of Dante's birth in 1865, and to solemnise in the course of the present summer the four hundredth anniversary of the death of Petrarch, one is inclined to ask why the four hundredth birthday of Ariosto should not have been celebrated with equal patriotic and literary furore on September 8. Surely Reggio and Ferrara might have invoked some little enthusiasm in honour of the poet whose romantic tales of chivalry have fed the fancies, not of Italians only, but of men in all countries of Europe, through every intervening age that separates the time of the creation of his Orlando from our own day. Some recent Italian papers have indeed announced that an Ariosto festival is to be held next spring at Ferrara, but we think that as the appropriate year and day have been allowed to slip by, any so-called commemoration had better now be avoided. Happily Ariosto's memory needs no spurious aids to keep it alive.

THE Hamburg papers announce that the poet and novelist Robert Waldmüller (Edward Duboc) is preparing, under the title of "Leid und Lust," a new series of novelettes, of which two have already appeared at Stuttgart. The first entitled *As a Sutor*, is said to give specially bright and life-like pictures of society in Normandy, reproducing with great vivacity the "causeries" and everyday routine of French provincial society among the upper classes; whilst the second of the tales published is equally successful in its delineations of German character. The scene of this novel, which is entitled *Fashion in the Country*, is laid in the Saxony of the last century, at the time of Gellert, who is introduced into the story and made to cut the Gordian knot of the complications of the plot. The period chosen by the author, the critical one, in which old institutions

were beginning to totter, and the props of society giving way on all sides; and in the judgment of German critics, he has acquitted himself skilfully of his task of annotator and satirist of the by-gone things and thoughts of the age immediately preceding the French Revolution.

The Periodical Literature of the United States of America is the title of a valuable work published by E. Steiger in New York, to whose untiring energy the American department of the Vienna Exhibition was indebted for a collection of examples of the various periodical publications of the Union. In order to prevent his labours from being merely ephemeral, the owner of the collection shown at Vienna has published a catalogue, from which we glean the following facts:—The English language holds the first place in the periodical publications; the second place is taken by German. For the State of Ohio the periodical German press numbers no less than sixty-five organs, but only eighteen in Cincinnati. French is represented by thirty-eight periodicals, twenty-one of which belong to Louisiana. Of the remaining Romance languages, the Spanish boasts the highest number, seventeen; Italian but three; and one paper, published in New York, *O Novo Mundo*, is in Portuguese. Danish, Norwegian, Dutch, and Swedish are more or less represented. Of the Slavonic languages we meet with Czech, Polish, and Russian. Four papers appear in Welsh. Of the numerous German compound dialects, such as those with which Charles Leland's poetry has made us acquainted, Pennsylvania German possesses a periodical journal of an amusing character, *The Pennsylvania Dutchman*, of Lancaster. Lastly, we may mention the *Cherokee Advocate*, in Cherokee and English, brought out in the city of Tahlequah, in the Indian Territory, and the *California China Mail and Flying Dragon*, printed in San Francisco, in English and Chinese. The import of this literature of 8,081 publications is naturally very varied. For instance, one paper from Hinidah in New Hampshire, *The Star-spangled Banner*, is entirely devoted to the disclosures of impostures and swindling transactions. Eighty-seven periodicals belong to the Temperance Societies alone, but only thirty-two to surgery. The same number are devoted to advancing the interests of the Roman Catholic Church, six to the Swedenborgians, five to the Spiritualists; five also are specially dedicated to the Protestant creeds; fifty-one journals call themselves Evangelical, five Mormonitic, fifty-six Methodist, seven follow the lead of Zinzendorf; one, *The Desert Evening News*, in the Salt Lake City, is the official organ of Mormonism, according to Brigham Young's type; whilst the Josephite Mormons in Illinois command three papers.

IN the *Revue des Deux Mondes*, Oct. 1, M. Albert Réville gives a fair and intelligible account of Hartmann's "Philosophy of the Unconscious," which he describes as owing its popularity to anything rather than to the purely metaphysical merit of the speculations. M. Réville exposes the fundamental ambiguity of the system, which consists in assuming every efficient tendency and every perceptible object in the natural universe to have a subject related to it, as the human subject is related to the conscious tendency which is properly called will, and to the conscious perceptions which are the matter of thoughts. The article enters into a few biographical details, from which it appears that the author was born in 1842, so that when the *Philosophie des Unbewussten* was published he was younger even than Schopenhauer when his chief work was written. He entered the army at sixteen, was disabled by an accident, and retired in 1865. It will be news to most English readers that Herr von Hartmann is the author of two tragedies, *Tristan and Isolde*, and *David and Bathsheba*, in addition to his philosophical works and dramatic criticisms.

SINCE its first appearance the ACADEMY has

striven to follow the developments of Scandinavian literature with sympathetic attention, but we have been obliged once and again to point out the sluggishness of thought and the indifference to European progress which mark too many of the phases of Northern literary life in our generation. We have repeatedly expressed surprise that no better organ of literature and art than the worthy but tame *Svensk Tidskrift för Literatur, Politik och Ekonomi* existed at present in Scandinavia. The first number of a new Danish review has just come into our hands, and we are anxious to express at once our satisfaction at the ability with which it is started. It comes from the quarter from which alone any good thing in aesthetics can be expected, the group of young men that cluster round Dr. Brandes, the apostle and martyr of modern intelligence in Copenhagen. It is entitled "The Nineteenth Century," *Det nittende Aarhundrede*, and is edited by Georg Brandes, and his brother, the eminent Orientalist. The October number opens with the earlier part of a study on Paul Heyse, by the first-named editor. The clearness of insight, fearlessness of utterance, and harmony of style, are all that one would expect from the greatest master of modern Danish prose. The paper opens with a general view of Heyse's individuality, in which Dr. Brandes finds a happy blending of two forms of modern character, apparently incompatible. "More than one eminent poet of our day dreads, like Mérimée or Leconte de Lisle, the exposition of his emotions so keenly, that he comes at last to affect an habitual lack of emotion that is not quite natural to him. For Heyse this temptation does not exist. He has never for a moment been able or willing to affect more warmth or coldness than he felt. . . . He strives after neither the flaming impetuosity of a fiery temperament, nor the artificial calm of a man of the world. By the side of Swinburne he seems calm, and by the side of Mérimée naïve." This brilliant essay is followed by a little story of Danish life in the seventeenth century, written by J. P. Jacobsen, the gifted young naturalist who has translated Darwin's *Origin of Species* into Danish. Edvard Brandes gives an account of the results of Mr. George Smith's Babylonian discoveries, and the final paper is occupied with reviews of the two best Norwegian books of the twelvemonth, the *Kejser og Galilæer* of Ibsen, and the *Lødsen og hans Hustru* of Jonas Lie. Altogether there is not a commonplace or dull page in the whole number, and if *Det nittende Aarhundrede* can sustain itself at the present level of excellence, it will take a very high place in the periodical literature of Europe.

AMONGST minor matters written about by Francesco Zonca (Venetian Secretary in London temp. Charles I., copies of whose correspondence have been sent to this country by Mr. Rawdon Brown), is the arrival in London from Madrid of the celebrated beauty and stateswoman, Marie de Rohan, Duchess of Chevreuse, in May, 1638. She brought many curious gifts from the Spanish Queen to her sister, Henrietta Maria, and was entertained after a most liberal fashion by their Majesties. 40*l.* per diem were allowed for her table, and 200*l.* per month pocket-money, whilst the Queen's wardrobe supplied her with apparel; so that "Dame Liseite" (as her contemporaries called her), must have cost the Crown 2,500*l.* monthly. Amongst other occupations, she attempted the conversion to Catholicism of Henry Rich, Earl of Holland, and the arrangement of a match between the Princess Royal and the Prince of Spain. She was allowed to seat herself in the presence of the Queen, much to the mortification of M. de Bellièvre, who could not obtain a like privilege for the French ambassadress. To his remonstrances the Queen answered that were his wife accommodated with a seat, all the chief ladies of England would rebel, and claim a like freedom, which, she added, was denied even to her own daughter, the Princess Royal. The

Duchess of Chevreuse, on the other hand, was a foreign princess, and the King's kinswoman.

With regard to the Venetian manufactures which found sale in England, the Ambassador Correr, Zonca's predecessor, had written much about Sir Robert Mansell's monopoly, as interfering with the importation of Murano glass. In March, 1638, Zonca mentions the arrival in London, from Antwerp, of two Muranese, one of whom made mirrors and the other polished them. Mansell endeavoured to hire these artificers, but Zonca succeeded in sending them back to Venice, and also informs the State that he hoped to do the like by one Gasparo Brunoro, alias "Three Crowns," also a native of Murano, who offered to produce Venetian glass of every form and colour, and to teach his art to six Englishmen. At this time Brunoro was articulated to Sir Robert Mansell, who paid him 5*l.* per week as salary—a heavy sum in those days.

M. LUCE, keeper of the national archives in Paris, has lately read before the Académie des Inscriptions a memoir intended to show that the treaty between Charles the Bad of Navarre and Edward III., given in Rymer as dated August 1, 1351, and providing for the division of the whole of France between the two contracting parties, belongs really to the year 1358, the only date which allows of all its provisions being explained as acceptable on both sides. During the truce which was to terminate at Easter 1359, English troops were allowed to serve under the King of Navarre, and had taken Poissy and Saint Cloud, which, in spite of the truce, when taken, continued to be held for England. By the treaty they were ceded to Charles, together with Champagne and La Brie, while the rest of the country went to his ally. M. Luce's theory, to explain so one-sided an agreement, is that the King of Navarre had just received intelligence of the death (on July 31) of Etienne Marcel, the Provost of Paris, and the consequent failure of the plot by which he had counted on obtaining an entrance to the capital.

In the *Revue des Deux Mondes* (October 1), under the title of *Les conseils d'un constituant de '89 à la France d'aujourd'hui*, M. Saint-René Taillandier treats of the *Memoirs of Malouet*, of which a second edition has recently been issued. Malouet was one of those men, like the Falkland of our revolution, who leave behind them the impression that they ought to have done more than they did. There can be no doubt that France would have been better off if it had shaped its fortunes according to the counsels of Malouet than according to the counsels of Robespierre. A constitutional monarchy guarding freedom and justice would have been a far better thing than a convention caring a great deal for equality, and very little for freedom. But then this was precisely what could not be had. The revolution came about because neither the French aristocracy nor the king were in the least fitted to take the lead of the nation, and Malouet's constitutional schemes requiring that things and men should be otherwise than they were, were condemned in advance. Is France any more suited for such schemes now? Malouet's views, if he had now been alive, would, M. Saint-René Taillandier thinks, have been waived in favour of the Septennate. He would have advised the Assembly to constitute a second chamber, and to vote a just and sincere electoral law. If at last a Republic comes, it would be possible under these conditions to live under it with resignation. The writer does not take the trouble to tell us what sort of electoral law, or what sort of second chamber he would propose. Is this scheme one for giving the country time to know its own mind by imposing temporary checks upon over-hasty action? or is it one for setting up a barrier against the declared wish of the country, so that nothing could be done without the assent of men of certain political views, or of a certain social standing, or still worse, of a certain amount of wealth. If the latter be the case, his constitutional law will

share the fate of the constitutional laws of Malouet and his friends.

THE *Times* states on the authority of the American journals that some old papers have come into the possession of Captain Luther Dame, of Newburyport, Massachusetts, a near relative of his having bought the house formerly occupied by Sir William Pepperell, in Kittery, Maine. The papers range from bills of lading and the indentures of an apprentice to instructions by General Braddock for the conduct of a campaign; and many are of much interest as relating to one of the most prominent men in early New England history. Among them, dated "Camp at Alexandria, April 16, 1755," is an order signed by General Braddock, giving instructions to Colonel William Shirley. The orders to Colonel Shirley are to take command of his own and Sir William Pepperell's regiments, and to proceed "with all convenient expedition to attempt the reduction of the French forts at the straits of Niagara." He is to leave a garrison at a fort at Oswego, and to apply to Governor De Lancey for what money he wants, and to keep General Braddock informed of his situation as far as possible, in order that a junction of the two forces might be made as soon as "the affairs of the Ohio are determined." The reason why Sir William Pepperell did not accompany this expedition is given in a copy of another letter from General Braddock, in which it is said that Sir William, having been appointed a "Major-General in the King's army, a command of those provincial troops would be inconsistent with his rank." There are also papers of previous date relating to the Louisburg expedition. One of date September 7, 1745, directed to Hon. Lieutenant-General Sir William Pepperell, is the account of men employed in works at Louisburg by Colonel Shirley. Another, of November 6, at Louisburg, and addressed also to Sir William Pepperell, speaks of his Excellency Governor Shirley, and is a draught of money to pay workmen. There is also a petition, dated London, July 1, 1746, to the Duke of Newcastle to assist the Louisburg expedition, and signed by Christopher Kilby, agent to his Majesty's Province of the Massachusetts Bay, in New England. The same Christopher Kilby writes from Spring Gardens on May 30, 1747, a long letter, of which the following is the beginning:—"Honoured Sir,—I have delivered to Major Wise, who goes a passenger in one of the men-of-war, your patent for Baronet, in a box, with the broad seal. The grant of arms from the Herald's office in a glass frame, and a small box, containing your own watch and Lady Pepperell's, with a gold chain, an egg, a seal, a crystal heart, and a picture of the Duke. Also your own seal, very neatly cut, and a box with the impression of the three faces." Besides these documents, Captain Dame has the spectacles and a shell snuff-box of Lady Pepperell, and a needle-book in which two of the leaves are made of the scarlet coat and buff facings of the coat which Sir William Pepperell wore at the taking of Louisburg.

THE Swiss Historical Enquiry Association held its assembly on the last two days of September in Solothurn. The first day was mainly devoted to the business affairs of the Society, the second day to its literary objects. About fifty members took part in the proceedings, from the Cantons Bern, Solothurn, St. Gallen, Basel, Geneva, Freiburg, Luzern, Argau, and Vaud. Professor G. von Wyss, of Zurich, presided; he was re-elected for the coming three years by a majority of the members, the only other candidate being Herr Fialä, Dean of the Cathedral of Solothurn. Professor von Wyss referred touchingly by name to each of the members of the society who had been removed by death during the present year; many of these, indeed, were men little known out of Switzerland, two, however, were of European reputation, Professor K. F. Hagenbach, of Basel, and Father August Theiner. A report was given of the state of the

Society as regards its publications, and much time spent over the consideration of its proposed new statutes. It was agreed to restate the object of the Society in the following words:—

"The object of the Swiss Society for historical investigation is, by bringing the students of the History of the Fatherland into connexion with one another, and by offering a point of union to the various Cantonal Societies which devote themselves to that study to forward the progress of Swiss History, by works for which general co-operation is needed."

Many students of our nation, as well as the Germans and the Swiss, know that valuable historical papers are sometimes to be found almost buried and unknown amongst the printed transactions of the local and cantonal societies of the Confederation. A central Historical Society, which shall keep watch over all these local Societies, will be a real benefit to historical enquirers, if it will thoroughly carry out, as this Society promises to do, the plan it has laid down. It is still left undecided whether the next yearly assembly shall be held in Glarus or Luzern; the committee hopes to come to an arrangement with the members of the Fünffürter Historischer Verein to meet at the same time and in the same place. Professor Meyer, of Basel, introduced a subject which led to a long discussion, but did not issue in any distinct resolution. He said that a literary man from Vienna had been compelled to pay three francs and a half for the use, for scientific purposes, of a document at Vicosoprano, in the canton of Graubünden. It was agreed by all that such a practice was blameworthy, and that the principle should be established that no tax should be demanded for the scientific use of any document. This is the case with cantonal archives. Some private possessors dislike copies being made; a severe censure was passed upon such dogs in the manger by the Society.

The literary proceedings of the second day began with a comprehensive address by the president. Professor von Wyss gave a conspectus of the progress of the last three years in the province of Swiss historical enquiry, and the collection of archives. He summarised the most important publications, and coming to lesser details, took notice of the great crowd of minor historical memoirs, and especially of biographies, which have appeared during that interval in the daily and monthly periodicals of Switzerland. "A wonderful zeal for historical research has been stirred up," he said, "and the success corresponds to the zeal." He closed his address with a reference to "Bundesrevision," without which the public speech of a Swiss citizen at this time would be incomplete. Historical research, with scholars of the best modern Swiss type, is not a curious amusement, but a service to the living generation:

"We are desirous of joining together anew to give our common help and furtherance to science and to the feelings of patriotism which it awakens. May the revision of the federal league put forth fresh blossoms in our society."

Several papers were read during the day. Professor Baucher, of Geneva, delivered a lecture upon the *Weisse Buch*. In this so-called *Weisse Buch*, the history of Tell is related by Uri, Schwyz, and Unterwalden; he showed proofs that the author of it had largely used the "Justingersche Chronik." Staatschreiber Annet, of Solothurn, read a paper upon Wilhelm Herter, the hero of the battle of Murten (better known to us as Morat). There is great uncertainty amongst historians about the origin and life of this man, who played so great a part in the battle. The compiler of the history of Switzerland in the old *Cabinet Cyclopaedia*—for so long our only English History of Switzerland—sets him down without hesitation or misgiving as "Herter of Strassburg." The year 1876 will be the fourth centenary of that great battle, and will be observed by the Swiss with much fervour. The work of Mr. Kirk on Charles the Bold has been well read in Switzerland, and no little indignation is felt

on the manner in which he characterises the participation of the Swiss in the Burgundian war. "It was undertaken at the instigation of France, for the interest of France, and in the pay of France." The first of a series of articles on "Die Säcularfeier der Burgunderkriege" appeared in the *Sonntagsblatt* of the Bund of Bern on Sunday last, October 4. The writer feels that he is called upon to prove that he and his countrymen ought not to celebrate a "Busstag," but can honestly keep a "Freudenfest" on the anniversary of Murten. Pfarrer Ochsenbein, of Freiburg, laid before the Society a paper relating to the battle. He is working at a festival lecture, and has thrown himself entirely upon the study of original documents. He hopes to give fuller demonstration than has yet been offered of the part taken by Wilhelm Herter in the battle. Professor Hidber, of Bern, treated the subject of the history of the use of tobacco in Switzerland. There are plentiful materials, we believe, in other cantons for studying the fight of tobacco for toleration amongst the confederates, but Herr Hidber dealt mainly with his own canton, in which the tobacco war was both severe and amusing. Dr. Bachtold, of Solothurn, added some illustrations from this canton. Dr. Wyss, the president of the Society, spoke on the social and national importance of this war. It is an agreeable feature in the constitution of this Society, that in the present bitter divisions of Switzerland, that it is composed of politically heterogeneous elements, and it is still more agreeable to find that they have worked hitherto without difficulty or conflict. Two recent publications were distributed to the members after the closing banquet and the customary toasts and "hoche": 1. *Lorenz Aregger, Sklave in Algier*. Nach seinen eigenen Aufzeichnungen. Edited by Herr Annet, and dedicated by the Society to the Historical Union of the canton of Solothurn. 2. The Urner play of Wilhelm Tell. By Wilhelm Vischer. *Ein hübsch Spyl, gehalten zu Ury in der Eydgnoschaft von dem frommen und ersten Eydgnossen, Wilhelm Tell genannt*.

NOTES OF TRAVEL.

THE conductors of the Austrian expedition to the North Pole have agreed amongst themselves to publish the history of their travels in two books. One of them—the larger one—will contain the scientific results, and the other one a narrative of the adventures of the expedition. The latter is to be written in a more popular style. All the principal members of the expedition will be contributors to these works.

SCHLAGINTWEIT, the traveller, is giving lectures at Königsberg. On the latter days of last week he devoted several lectures to an account of the Pacific railway. Another lecture treated of California and the Chinese settled there; and in another he spoke of the indigenous peoples of America. According to the lecturer, the Redskins are destined to disappear altogether in the course of a few dozen years, because they are impervious to civilisation.

THE correspondent of the Russian *Gazette de l'Académie* writes that an Englishman of the name of Hobham was organising a colossal undertaking which was to cost five million roubles, and was nothing less than the diversion of the waters of the Arpatchai into channels to be cut throughout the length and breadth of the vast desert plain of Sardar Abad, for its thorough fertilisation and cultivation. Mr. Hobham has already obtained the grant of the plain from the Russian Government; the works have commenced, and Mr. Hobham hoped to attract 100,000 Irish and German emigrants to settle on the reclaimed lands.

MR. VICE-CONSUL DUPUIS, in his just issued report on the trade and commerce of Susa (in Tunis), relieves the usually formal nature of such documents with a few notes of a classical nature.

Too familiar from early reminiscence of school-days, he writes, are the accounts of Caesar's exploits for one on the spot of contested sites of towns now no more to forego all comment. Mr. Dupuis then proceeds at some length to connect certain modern towns with those mentioned in Caesar's *Commentaries*. Thapsus, where Scipio and King Juba were defeated, stood unquestionably at Cape Demas, the salt lake spoken of being Sibkha Nen Noon. The ruins here are on a large scale. The amphitheatre, the vast cisterns, and immense quantities of marble fragments, show that a large town once occupied the site. That in the present miserable hamlet of Eldjem we see the ruins of Thysdrus is proved by an inscription, now to be seen at the chapel of St. Louis, at Carthage, which was found among the *débris*. The magnificent amphitheatre, which is in some respects the counterpart of the Colosseum at Rome, is almost intact; remnants of columns and fragments of marble are scattered around. It is possible (thinks Mr. Dupuis), that search on this spot would bring to light more than has been found at Carthage.

OFFICIAL accounts from Aleppo state that the ill-advised measures adopted by the Turkish authorities with the view of making the Arabs of the Desert till the soil have been altogether unsuccessful. Their pastoral propensities are opposed by force, but the only practical result is the impoverishing of the population. A few strips of cultivation are to be seen on the banks of the Euphrates, but those who sow are afraid to return and reap, lest they should again fall into the hands of the Turks. Portions of tribes have been surrounded by cordons of troops, their horses and mares taken from them, their sheep made to die of starvation by being prevented from seeking pasture. These unwilling husbandmen being then compelled to sow a field or two with corn, the troops leave them to settle as they best may, and begin the same process with another tribe.

In a recently published memorandum on Central Asia and its trade with Hindustan, Major Montgomerie states that—

"the chief articles exported from Hindustan to Eastern Turkistan are opium, coarse Amritsar shawls, various kinds of brocades, or kimbab, red leather, cotton, chintzes, sugar, and spices. The chief imports from Chinese territory and Turkistan consist of pushm or shawl wool, tea, charras (extract of hemp), silk (made up and raw), silver, gold, borax, sulphur, ponies, &c. . . . Though the traffic through Ladakh has diminished, a large portion of it has only been diverted to other and more difficult roads, with, of course, an increased cost of carriage, but to what extent I have not the means of knowing, though it is well known that the Chinese send a good many things down the Sutlej, avoiding the Jamu Maharajah's territories altogether. . . . Traffic is at present carried on between the Punjab and Eastern Turkistan, and also with Lhasa; but between Eastern Turkistan, in latitude 36° and longitude 80°, and Lhasa, in latitude 29° and longitude 92°, I know no other place of any great importance at the back or north of the Himalayas that would be likely to afford the base for a large traffic. Kafilas come from Yarkand and Khotan to Leh (Ladakh) every year, and one kafilas or more comes from Lhasa to Leh. . . . Lhasa can be most conveniently reached from Bengal by Darjiling, Assam, &c."

In summing up, the same officer expresses an opinion that trade with Hindustan would suit the people of "Eastern Turkistan best, more especially as they consume many of the products of Hindustan, which are not produced in Russia at any rate—such as opium, sugar, spices, &c. In the first place, the capital, Yarkand, is (as the crow flies) 300 miles from Jhilam; whereas the nearest point of the Caspian is 1,030 miles; any similar point in China is perhaps 3,000 miles, and is separated from Yarkand by the thirty marches across the great desert of Gobi; and consequently there is but little doubt that the routes to Yarkand favour the trade with Hindustan."

MR. BAUERMAN, the gentleman deputed by the Duke of Argyll to examine the iron and coal deposits of India, has issued his report, but it is not very encouraging as regards the prospect of future mineral wealth for India. The best iron ore he has seen is the brown hematite of the Nerbudda valley, which is found in limestone about twenty-five miles north of Gurrawara; and if good coal be discovered in the borings now going on there, that station would form a good site for iron works producing small bar and sheet iron and similar high classed products. There is no locality which answers perfectly all the requirements for iron working, but on the whole Raniganj seems to offer the best site. It is only fair, however, to that distinguished body, the Geological Survey of India, to remark that this conclusion entirely confirms their previously expressed opinions. At the time that they surveyed Raniganj, it was considered unadvisable to recommend the establishment of large ironworks, but since then increased facilities of communication, discoveries of better coals, the possibility of making coke, and the steady rise in the price of imported iron, have made the successful manufacture of iron a less doubtful speculation than before. It is much to be wished in the interests of India that these expectations may be realised.

THE Nile appears from all accounts to have occasioned great anxiety to the Egyptian people during the last fortnight. About the beginning of September news came from the Soudan that the summer rains had abnormally swollen the stream; shortly afterwards, it appeared that at four places in Upper Egypt the river had burst its bounds, and had laid a large extent of country under water, the loss of life and property being very great. In this crisis great energy was displayed by the Government and people. Not less than 200,000 men have been distributed along the course of the river and the great canals in Lower Egypt, and at the weakest points watchmen are posted every fifty or sixty yards. At Damietta, a dyke gave way, but it was promptly repaired, and beyond that caused by infiltration, there now appears to be no prospect of any serious damage. The most recent telegrams state that the subsidence of the waters has actually commenced.

THE *Chicago Tribune* states that General Sheridan, in his recent expedition to the Black Hills (already noticed in our columns), took the precaution to take two experienced gold-seekers with him, and that they were fairly surprised at the abundance of gold in the district. The deposits extend for about 150 miles north and south and 200 miles from east to west. The region is at present occupied by the Sioux Red Skins, and they form such a mixture of hostile and friendly tribes, that some difficulty is anticipated in getting them to "move on" westward without having to resort to force.

COLLEGE FOR MEN AND WOMEN.

AN inaugural meeting of this institution will be held at eight o'clock next Monday evening, at St. George's Hall, Langham Place, under the presidency of Mr. Thomas Hughes. For ten years past it has been known to many good friends as the College for Working Women, 29 Queen's Square, and under this designation it performed a small, but not unimportant, educational function. Here came mothers, that they might be able to teach their children in the course of time. Here came certain brave girls, out of a love of knowledge that was stronger than the love of pleasure or the natural weariness that follows a laborious day. And how constant and unflagging this love of knowledge was! Year after year found the same students following up one course of study after another. It would have been a pity, certainly, had there been a want of opportunity for this fine devotion. For a long time, however, it has been the desire of the managers to realise the idea of the late

Professor Maurice, and so to enlarge the scope of their institution as to throw open classes, library and conversation room, to men as well as to women; and this after long deliberation, and after having assured themselves of the sympathy and co-operation of their old students, they have at last resolved to do.

We are all familiar with the current arguments against mixed classes. Similar classes, however, are already successfully carried on in many institutions alike in London and the country; and there are many special reasons why they should be employed under the circumstances. The council remind their friends generally "of the many evils which arise from the separation of men and women in the worlds of learning and thought, and of the ennobling influence which each sex has upon the other, when both are united in a common work with serious purpose and endeavour." But out of the special circumstances, as I say, there arise special reasons in favour of the scheme now adopted. The number of students with the old system was necessarily so limited that there was a certain waste of power, especially in the higher subjects, which will, it is hoped, be now no longer the case. Again, wives and sisters will be free to come to the College under the new conditions, bringing husband or brother along with them; and the prosecution of some worthy study will no longer entail upon them the discomfort and actual danger of another daily separation, besides that already entailed upon them by their necessary work. Men and women, besides, will thus be brought together by common devotion to culture instead of the usual haphazard juxtaposition and perpetual "handy-dandy" of the world. And once brought together, they will associate in an atmosphere not otherwise attainable for them; their intercourse will take on something of refinement from the example of those among whom they move; and so culture will be begun in them, not only of a deeper kind, but in a manner more intimate and effectual.

Besides increased supervision, and the care which the Council has taken to leaven the life of the college by the presence of those well qualified to do so, the programme will remain as before. The classes will include, as before, those on Mathematics, Literature, Languages, Physical Science, History, Law, and Art. The Saturday evening lectures will be given, for the present session, by Professor Morley, Mr. Furnivall, and Mr. Newton, of the British Museum. To all who have the higher culture of the working-classes truly at heart, this announcement cannot fail to be of interest; and the interest will become more serious and hopeful, I believe, as the facts are more carefully weighed.

ROBERT LOUIS STEVENSON.

HENRIK IBSEN'S RETURN.

Christiania: September 24.

THIS somewhat sedate—not to say dull—capital has during the past few days been the scene of unwonted excitement. This break in our habits is not due, however, as generally is the case at this season to the meeting of any learned congress, or to the more trivial festivities of an international exhibition, but simply to the visit of the national poet—Henrik Ibsen. For many years he has lived in Dresden—turning his back upon his native land because he imagined his countrymen too dull or too careless to give his works the attention they deserved. And it must be allowed that had it not been for the high praise accorded to Ibsen in Germany, and more recently in England, it is probable that many Norwegians would have been even now ignorant of the genius, whom their want of sympathy had banished from the country. Of late years however, and more especially since the revival of the national theatre at Christiania, the works of Ibsen have become better known to his compatriots, and the more they

were known the more were their beauties acknowledged and appreciated.

From Dresden, where Ibsen had been living during the last ten years, he has written one after another in rapid succession five or six pieces, besides a considerable quantity of minor poems, which have obtained for him the undisputed rank of the greatest of living Scandinavian poets. His principal works are *Brand*, *Per Gynt*, *De Unges Forbund*, *Kongemærnerne*, *Kejser og Galilæer*, most of which are accessible to those unacquainted with Norsk through the medium of excellent German translations. In spite, however, of their admiration for his great talents, the Norwegians were too good patriots to be able to pardon their master-singer for having abandoned his native land. It seemed to them as though his works lost some of their value for them by being written in a foreign country. On the other hand, they explained in some degree the satire and irony of his writings to the bitterness with which they thought he regarded his country, and took as pointed against themselves and their former blindness his sharpest and most cutting epigrams.

During the ten years of his self-imposed exile, Ibsen paid frequent visits to both Denmark and Sweden, and in both countries was received with all the honour due to his genius and renown. By degrees a feeling grew up in Norway that he would never put his foot again on his native land, and that he continued to look upon his compatriots as his enemies. That this feeling was wholly without foundation is evident from the events of the last few weeks. Ibsen after passing a short time in some of the remote districts of the country, and revisiting the scenes with which he was once so familiar, arrived in Christiania a few days ago. The anger of his countrymen vanished as if by magic, and Ibsen has been the object of more enthusiasm than it was possible to imagine the lymphatic Norwegian capable of feeling or displaying.

The great fête, however, was that given by the students of the Christiania University. They formed themselves into a vast procession and went to Ibsen's lodgings to offer their homage to the poet. On reaching his lodgings in the Pilestraeda a deputation was sent up to him, and on hearing of their arrival, Ibsen came down into the street. After singing the first two verses of a hymn composed for the occasion, the students saluted the Skald with loud cries of "Long life to Henrik Ibsen!" accompanied by loud hurrahs, in which the vast crowds of bystanders joined. Ibsen then addressed them in the following terms, explaining through them to the country his real feelings and the cause of his long estrangement:—

"Gentlemen,—During the past few years, whilst living in a foreign country, the feeling has arisen from time to time more strongly in my mind that I must see my native land again. I will not disguise from you that it was with much doubt and uneasiness that I finally decided upon this journey home. My stay would, it is true, be but short; but I felt however short it might be, it would always prove long enough to dispel an illusion in which I would fain have continued to live. I asked myself, In what spirit will my countrymen receive me? The flattering reception accorded to my works could not fully reassure me, for the question still remained how do I personally stand with my fellow countrymen? For it is not to be denied that on more points than one there has been dissension between us. As far as I have been able to understand, the complaints urged against me were of a twofold nature. People took it for granted that I looked with unwarrantable bitterness on my personal and private relations with my countrymen—nay, further I was even accused of directing attacks against peculiarities and incidents of our national life, which in the opinion of many had a claim to be treated with anything but irony.

"I do not think I can make a better use of the present moment, so full of gratification and honour to me, than to devote it to an explanation and a confession.

"I have never made my private circumstances the immediate subject of any poem. In former sorrowful days I attached less importance to these circumstances

than I have since been able to justify. When the eider's nest was plundered for the first, second, and third times it was robbed of its illusions and of great life-inspiring hopes. At times, too, I felt that I with others stood responsible for a period when high thoughts and noble aspirations were buried under songs and feasting.* But let me leave this subject, and ask what is the poet's work? I understood it late in life. It consists mainly in seeing, but also in making others see, objects as they appear to the poet's eye. But one's own life-experience can thus alone be seen and shown. This need of life-experience is precisely the secret spring of all modern poetry. Every poem I have composed during the past ten years I have lived through in spirit. But no poet's experience can be his own alone. That which he sees and feels, his contemporaries see and feel also, for if they did not how could the giver render himself intelligible to the receiver?

"And what have been the life-experiences whence my poetry was inspired? The field was wide. I wrote partly of those things which, but as glimpses and in my best hours, have moved me with the living force of all that is great and beautiful. I wrote of that which stood above my daily self, and wrote of it in order to hold it fast before my eyes and in my soul. But I wrote also of things of an opposite nature—of things that inward contemplation shows us as the dregs and refuse of our own being. In this case the poet's work has been to me as a bath, whence I felt that I arose purer, healthier, freer. Yes, Gentlemen, no one can represent as a poet that of which he has not to a certain degree, and at all events at certain moments, had the model in himself. Where is the man amongst us who has not, now and again, felt and acknowledged in himself a contradiction between word and act, between wish and duty, between life and doctrine? Or where is the man who has not on some occasions revelled in a feeling of egotistical self-sufficiency, and half as a foreboding, half in downright earnest, painted his state in fair words both to himself and others?

"In speaking thus to you as students, my words will be understood as they should be. The student's mission is in many points identical with the poet's; the one as well as the other has to render first to himself, and then through himself to others, a clear account of the questions both temporal and eternal that agitate the times and the world to which he belongs.

"In this sense I may truly say that during the years I have spent on foreign soil, I have tried to be a good student. A poet belongs by nature to the far-seeing. Never have I seen my native land and the life there so fully, so clearly, so closely, as I did from my far-off home beyond the sea.

"And now, my dear countrymen, let me end with a few words that also have reference to an experience in real life. When the Emperor Julian towards the close of his career saw himself surrounded by crumbling ruins, nothing struck so deep into his mind as the thought that all he had achieved was to be remembered with honour and esteem by a few cold clear heads, whilst his adversary was enshrined with love in warm living human hearts. And pondering on this ancient story a question has often arisen in my own mind during my solitude in a distant country. To that question the youth of Norway has replied to-night, and by an answer fuller and warmer than I expected to receive. I shall carry back that answer as the richest memory of my visit to my countrymen, and I trust that the events of this day are an experience which will some day be reflected in a future work. If this should happen, and if I do some day send home such a work, I beg the students to accept it as a clasp of the hand, and as thanks for this our meeting I beg them to receive it as a work in which they have a part."

After the speech, which was received with loud cheers, the students sang the third verse of their song and then quietly dispersed.

The evening closed with the performance of Ibsen's comedy of *De Unges Forbund* at the National Theatre.

EDITH PRADEZ.

* The poet here alludes to the "Scandinavianism" which the youth of his generation imagined they could found by means of speeches, patriotic songs, and festive gatherings of the students of three Scandinavian kingdoms. Nothing came of this powerless effervescence of enthusiasm, and Scandinavia still awaits her Bismarck.

BARRY CORNWALL.

MR. BRYAN WALLER PROCTER, better known as Barry Cornwall, who died last Monday, was a pathetic example of the wastefulness of destiny. He was born thirty years too soon, or two hundred years too late, and so his rare and high powers ran to seed. He had great quickness and delicacy of literary feeling, and a combination not very common, of force and vividness of expression, with a suggestive artistic reserve. He had not the kind of imagination which is capable of organising and peopling a coherent ideal world, and the real world did not supply him with the materials which would have fertilised his talent. He never revolted against the complicated decorums of modern civilisation and respectability, but his works show an inexpressible pining after a freer and simpler life, where primitive passions could have fair play, and attain to an ideal elevation. Instead of finding characters and scenery among his contemporaries to inspire him, he had to inspire himself with the literature of the Renaissance, especially that of the Elizabethan age. His literary activity was concentrated into a very small space—the years between 1819 and 1823; after that he wrote nothing except songs and editions and criticisms and biography. It is curious at first sight that he should have written nothing till he was over thirty, if the accepted date of his birth be right; but after he had escaped from the solicitor's office at Calne to the intellectual atmosphere of London, and the comparative freedom of the bar, he had to educate himself in company with those who, like Lamb and Leigh Hunt, were rediscovering the age of Shakspeare and Boccaccio. To judge from Mr. Jerdan's autobiography, he had scarcely begun to write before he began to publish, and, when he began, he poured out a singularly full and rapid stream of all kinds of verse, that was never hasty or unfinished in form, though often crude and incomplete in substance. His writings were well received, but he found he had to work at his profession, and the muse is a jealous mistress, who only pays flying visits to those who cannot spend their lives in waiting upon her. It shows the essential healthiness of his nature that, under these uncongenial conditions, he should have made so few excursions into the poetry of revolt. "Tartarus," a scene in which a Moorish magician sees the famous souls lost long ago, and then loses his own, is the most conspicuous instance, and proves that he could imagine, if he could not produce, most of the effects of the Satanic school. Magic had rather a fascination for him always, but his fancy was hampered by his judgment: his perception of the dreariness of commonplace found better expression in the "Fall of Saturn," the "Letter of Boccaccio," and even in the lyrics dedicated to convicts and beggars and outlandish patriots. But the deepest expression of all the passion which could find no outlet for itself in life is the ever-recurring idealisation of Death, now as the jovial king who welcomes all to his court, now as the grim stranger who takes the fairest from the feast, now as the gentle comrade with whom the weary are at rest, now as the bride of the spirit "amorous-eyed."

The worship of Death is for the most part confined to the lyrics, and it is probably true that Barry Cornwall will be best remembered as a lyric poet: his talent was of the kind which is apt to be fragmentary except when it is sustained by a tradition, and it is only in the lyrical form that such a talent can reach completeness, the completeness of a snatch of a bird's song. Perhaps Barry Cornwall felt this himself, for he persevered in writing lyrics after he had given up most other forms of verse, and set before himself the systematic object of giving an expression to the varied and subtle moods of modern life, which should be as fresh and spontaneous as the lays of the minstrels of a simpler and, he owned, a coarser time. Perhaps the archaism detracts a little from the spontaneity;

at least it could hardly be said that the greatest excellence of his lyrics is to flow easily. His dramatic works show another side of his talent quite as exquisite as his lyrics, though circumstances hindered their attaining even the same degree of perfection. He understood thoroughly how to conduct a poetical conversation, which should be graceful and moving, with enough imagery and not too much; he could even, as his tragedy of *Mirandola* proves, arrange five acts with intelligent regard to stage effect; but he had little or no invention, he is always repeating the device of lovers parted by being led to believe each other false, and most of his dramatic scenes could hardly form part of complete plays. The situation is explained and not advanced. The fact is, that he showed his complete appreciation of the poetical language of the Elizabethan age by reproducing it instead of by describing it. And this applies to the least interesting section of his work, the metrical tales, which are a medley of bright and clear descriptions strung together by a thin thread of sentimental or humorous narrative, and only remarkable as showing how freshly he had felt classic and Italian literature. His directly critical writings have little value, with the exception of the very dignified and graceful tribute to Lamb. His preface to Kenny Meadows's illustrated Shakspeare is curiously naive and almost boyish: he was too old at seventy to learn the temper of a critical age, and he came too late to find the place for which he was really fit—at the feet of Ford and Fletcher.

CORRESPONDENCE.

THE POEMS OF WILLIAM BLAKE.

56 Euston Square, Oct. 5.

MR. PICKERING recently published a volume entitled *The Poems of William Blake, comprising Songs of Innocence and Experience, together with Poetical Sketches, and some Copyright Poems not in any other Edition*; and on September 5 I reviewed the volume briefly in the ACADEMY. Mr. Pickering, it seems, did not like the review; and he has now printed a little fly-sheet headed *William Blake and his Editors*, of which a copy reached me by post. There are in Mr. Pickering's fly-sheet two incorrect statements, which I wish to rectify—leaving its other readers to judge of any further argumentative or critical matter contained in it.

1. Mr. Pickering says that the editor of his volume, Mr. R. H. Shepherd, some years ago, "had with some reason accused the Messrs. Rossetti of taking unwarrantable liberties with the text of Blake," as published in Mr. Gilchrist's *Life* of that artist. Now there was no reason whatever for accusing "the Messrs. Rossetti" of anything of the sort. I, being one of the two Messrs. Rossetti, had nothing at all to do with the selecting or editing of the poems of Blake in that book. (I commented one single poem, *The Mental Traveller*).

2. Mr. Pickering says that, in my review printed in the ACADEMY, I have "impugned the veracity of a statement on the title-page of the new edition, to the effect that it contains some copyright poems not in any other edition." What I really did was to affirm—and I now re-affirm it—that the number of "copyright poems not in any other edition" is limited to two—viz.: the *Song by a Shepherd*, and *Song by an Old Shepherd*. It is true—and this I had already pointed out in the ACADEMY—that the edition contains one other fully copyright poem, *Long John Brown and Little Mary Bell*; also nine more poems (of which Mr. Pickering now specifies the titles) taken from a MS. book by Blake lately in Mr. Pickering's possession. But these are not "copyright poems not in any other edition:" for the *Long John Brown* was previously published by Mr. Pickering himself, in 1866; and the remaining nine were also thus published, and had before that, with some verbal modifications, been printed in Gilchrist's *Life of Blake*, 1863. W. M. ROSSETTI.

THE STYX AND THE KOKYTOS.

Athens: September, 1874.

According to Moses (iv. 5, 18), the Jews swore by the cursed bitter water. According to Homer (*Iliad* ii. 755; viii. 309; xiv. 271; xv. 37, 185; *Odyssey* v. 185; x. 514), the gods swore the most sacred and terrible oaths by the waters of the Styx, whose fall in a cascade from a great height he distinctly describes by the epitheta *καταβήμενον* *Στυγὸς ὕδωρ* and *Στυγὸς ἕταρος αἰνὰ πίερα*. The fall of the Styx in drops from a great height is also confirmed by Hesiod (*Theogonia*,

785 and 805), "cold water which falls in drops (the word *καταβήμενον* has this signification, *Iliad* xviii. 109) from a steep height. The very ancient immortal water of the Styx which flows in a rocky place." All the later poets represent the Styx as flowing in a plain in Hades. According to Herodotus (vi. 74), the Arcadians swore by the water of the Styx, which was falling in drops from a rock near Nonakris, a town in Arcadia, situated in the neighbourhood of Pheneos. According to Pausanias viii. 18, the water of the Styx is not only mortiferous to men and animals, but it breaks glass, crystal, and vases of baked clay. He adds that objects of horn, bone, iron, copper, lead, tin, silver, or amber, rot (*σχηματίζονται*) in the water of the Styx, which falls in drops from a lofty steep rock near Nonakris. I visited the fall of the Styx with a guide from the village of Solos, which is presumed to occupy the site of Nonakris. Of this city even Pausanias saw only a few ruins, which have since disappeared. The road is the worst I ever saw. After an hour's ride on a steep and narrow footpath I had to leave the horse behind and proceed for two hours and a half on foot. Bathed in sweat, I arrived at last at the Styx, which does not flow from the snow of Mount Chelmos, as E. Curtius writes (*Peloponnes* i. 195), but flows from a low cavern, 20 feet below the top of a perpendicular rock wall of that mountain 220 feet high. Owing to the smallness of the rivulet and the great height (200 feet) of its fall, the water at once dissolves in drops, which, by the attraction of the rock, unite again at half height on the wall, and with a very low murmur the streamlet reaches the ground, flows a short distance, and disappears by a subterranean passage. The most horrible and terror-inspiring wildness of the locality, and the the mysterious silence with which the waters dissolve in drops and soon disappear, explain the important and sacred character the Styx acquired in remote antiquity. But from the verses of Homer (*Odyssey* x. 513–514): "where into Acheron the Pyriphlegethon flows and the Kokytos, which is an arm or outlet (*ἀπορροή*) of the waters of the Styx," we learn that the poet understands by Styx only the source, and that he calls Kokytos the stream of the rivulet. Since, however, the word *κακότης* is derived from *κακόν*, and always has the meaning, "wailing, lamentation, in great distress," etc. (as e. g. *Iliad* xxii. 400 and 447; Pindar, *Pyth.* iv. 202), it is evident that the streamlet received this name from the tearlike drops into which it dissolves. This is also proved by the name of the river Acheron, into which both the Kokytos and the Pyriphlegethon flow, for Acheron is composed of the two words *ἀχρᾶ* *πίον*. *Ἀχρᾶ* means "pain, sorrow, sadness;" *πίον* means "to flow." The name Styx is derived from *στυγίω*, and means "the abhorred." The rock-wall from which the Styx, or better, from which the Kokytos flows, is of red colour, but that part of it which is touched by this streamlet's water is black, and this has given rise to the present name, "Mavroneria." It is true that the water of the Styx or Kokytos is very cold, but this is the natural consequence of its height of about 6,400 feet above the level of the sea. I have drunk copiously of it, and can affirm that not only is it not mortiferous, but that I never drank cleaner, more delicious, or wholesomer water than this.

About an hour and a half before reaching the waterfall I passed two caverns, both of which may lay claim to the honour of being that into which, according to Pausanias (viii. 18) the insane daughters of Proitos fled. One of these grottos, which is to the right and close to the path, contains remnants of small modern house-walls and is said to have been inhabited by an eremite; the other is to the left at a height of 300 feet in the smooth rock wall, which ascends at an angle of sixty-five degrees. One would never believe that this cavern could be scaled by men; but it is an historical fact that in the Greek revolution, at the approach of Ibrahim Pasha's army, thirteen Greek

families took refuge in it. My guide stated that they had been attacked there by the Egyptian troops, and that these had been repulsed with great slaughter. This is confirmed by the inhabitants of Solos. Remnants of steps cut in the rock can be traced from the foot of the rock up to the cavern, the entrance of which is nearly walled up. The villagers pretend that after the revolution it served as a den of robbers.

DR. HENRY SCHLIEMANN.

JOHN LYLY'S POEMS.

3, St. George's Square, N.W.

A QUESTION of great interest with regard to the author of *Euphues* is raised by the contents of the Rawlinson MS., Poetry, 148. It contains a copy of Watson's *Hekatompathia*, or *Passionate Pilgrim*, with an address, to "John Lyly the Authour, his friend," ending, "Farewell, John Lilliat," thus seeming to identify Lyly and Lilliat. The MS. also contains a series of poems signed "John Lilliat" or *λω λ*, which have not heretofore been printed or attributed to Lyly (so far as we know). Though the one printed below would suit well the tone of Lyly's petitions to Elizabeth in 1590 and 1593 for some reward, "lande, fines, or forfeitures," because his thousand hopes and hundred promises have brought him "just nothing," yet the "Lilliat, minister," of leaf 56, the "Dulcibell Porter, my scholler" of leaf 41, back, and the daughter Priscilla in 1590 (Lyly's only yet-known daughter having been born in 1603), seem to point to a second John Lyly = Lilliat.

J. FURNIVALL.

[MSS. Rawl. Poet., 148, leaf 37.]

LILLIAT HIS MALECONTENT.

1. Attend awhile,
The ragged stile,
That from my Muse doth flo:
Whose lowd lament,
Of discontent,
Copartner of my woe.
2. As men are friended,
So Lawe ys ended,
The adage olde doth say
And with the moste,
In evry Coast
Affection bears the sway.
3. Lewd Barabbas
acquitted was
And sett at libertie:
when *Jesus Christ*,
sonne of the highst,
Condemned for to die.
4. The innocent,
in discontent,
finds fewest friends, God knowes:
when greater sway,
bears all away,
with bigg bravado shoves.
5. Let little flie,
but looke awry,
Rewarded with a rapp:
When bigger bug
doth strue & strug,
And feareth not the slapp.
6. True iustice fleed,
Playne dealing dead,
The weakest to the wall:
Wronge sets a face
Right to disgrace,
The Judge pleads parcial.
7. Yet in all this,
Not one ther is,
My wronge will seeme to right;
But for myne ease,
am glad to please,
And say the Crowne is white. *λω λ*.

Lucæ. 21, 19.

Per patientiam vestram,
possidete animas vestras.
St. Barnard.
Deiectum, non eiectum."

SCIENCE.

The Physiology of the Circulation in Plants, in the Lower Animals, and in Man. By J. Bell Pettigrew, M.D., F.R.S., &c. (London: Macmillan & Co., 1874.)

THIS is a thoroughly disappointing book. Dr. Pettigrew is, I believe, a distinguished anatomist; his title-page states that he is a Lecturer on Physiology and an Examiner in the same subject at Edinburgh. When such a man takes the trouble to write a volume of upwards of three hundred octavo pages on the circulation, one would expect it to contain either new facts and views set forth in a logical and consistent manner, with some appreciation of the points at issue, or at least a careful and well arranged digest of what is already known on the subject. The reader of Dr. Pettigrew's volume will find but little of either one or the other.

The first portion, chiefly on the circulation in plants, is thoroughly unsatisfactory. It gives one the impression of being made up of extracts from note-books put together with hardly any attempt at arrangement, and of fragments of verbatim reports of imperfectly prepared lectures, with all the repetitions, loose statements, illogical arguments, and irrelevant remarks, which may sometimes be excusable in an over-worked lecturer, but which there can be no justification for printing. The style of this portion of the book may be judged of by an example which is hardly more than a fair specimen of some hundreds of sentences. Dr. Pettigrew wishes to say that the animals he is speaking of resemble the higher plants in having distinct vessels for the circulation of their juices, but no heart or contractile vessel. This he expresses in the following wonderful sentence: "We have now, you will observe, got distinct vessels in animals minus contractile power as in plants" (p. 83).

Nor is the matter any better than the manner. He states that "intracellular circulation is due in a principal measure to physical causes, such as absorption and evaporation, endosmose and exosmose, capillarity, chemical affinity, &c.," but gives us only the very vaguest idea of the way in which he supposes that these somewhat heterogeneous forces produce the phenomena he is discussing. Indeed in this, as in the rest of the book, he seems to have no clear physical ideas whatever. No one would complain of him for confessing his inability to explain the very obscure phenomena of the circulation of the protoplasm in vegetable cells, but nothing whatever is contributed to the solution of the difficulty by a diagram showing how a gyration of the contents of an oval cell might be produced by introducing and removing fluid at the right places in its boundary wall. Before any such explanation is accepted it must be shown that there are forces competent to introduce and remove fluid at the right places, and to an extent sufficient to produce the observed amount of motion. This is not even attempted.

Again, on page 51 there is a diagram representing two tubes with currents passing along them in opposite directions, and two oval cells between them with their contents rotating. It is said in explanation that

"the fluids passing through the vessels wash and penetrate the sides of the cells obliquely and cause their contents to gyrate." If this sentence means anything it must be that the fluids, after passing through the cell wall by an osmotic action, retain so much of their original momentum as to begin to move inside the cells along the wall, or at least in a direction making an acute angle with it.

The section on the foetal circulation is better put together, but does not seem to contain anything of much physiological interest that is not to be found in the ordinary text-books, except, indeed, such a startling remark as the following (p. 123):—"A mixed circulation amply meets the requirements of the foetus, and is a positive advantage, as it places the foetus in the condition of the reptiles, which are very tenacious of life, and endure much hardship without sustaining positive injury." The connexion between a mixed circulation and tenacity of life is of course nowhere explained. A great deal of space is occupied with a discussion on some points in the anatomy of the decidua, on which the author differs from Goodsir and Reid. I am not anatomist enough to feel justified in expressing an opinion on the matter.

A great part of what the author says about the hearts of vertebrates, as well as about the contractile vessels of some lower animals, is spoiled by a strange opinion about the action of muscular fibres. Dr. Pettigrew maintains (without a particle of evidence) that the elongation of a muscular fibre is as much an active process as its contraction, and that otherwise there would be a great loss of power—not understanding, apparently, that work done against the elasticity of an elastic body is not lost but simply stored up to be used again when the elastic body recovers its natural dimensions. When a portion of a machine has to move forcibly in one direction, and then to be quickly brought back to its original position, this is almost always done by means of a spring; the additional work done in extending the spring is simply what would have had to be expended in bringing the parts of the machine back to their original position if there had been no spring to do it. No power is lost, and that which is available is applied in what is usually the most convenient way. Dr. Pettigrew seems very unwilling to allow elasticity to play a greater part than he can possibly help. He says (p. 185): "A muscle is capable of acting in two directions: it can first elongate and then shorten itself; but these are opposite movements, and between them a pause or halt (the dead point of engineers) inevitably occurs. Elasticity gets the muscle over this dead point, and decreases the duration of the pause." A sentence which only shows that he does not know what "the dead point of engineers" means. Again (p. 172): "If rigid vessels were compatible with the movements of animals they would be preferable to elastic ones for carrying on the circulation, as, in this case, the heart would merely require to force on the blood without having to dilate the vessels. If we were asked to transmit fluid from one point to another we would never dream of employing an elastic tube." Certainly not, because iron and lead are

cheaper, stronger, and more durable than india-rubber; but when we have to cause a continuous flow through a pipe by means of an intermittent pumping action, as in a fire-engine, we necessarily make a part of the tube elastic by the introduction of the air-vessel.

The section on the valves of the heart and veins, and their action, is fairly well done, without any striking novelty, but that on the innervation of the heart is very meagre. Out of some five and thirty pages of which it consists, twenty are purely anatomical, and seven are devoted to a lengthy refutation of the doctrine that the contractions of the heart are caused by the stimulus of the blood (a refutation which does not touch the doctrine in any shape in which it has been held by any reasonable physiologist), so that the whole difficult and complicated question of the physiology of the nerves affecting the heart is disposed of in about eight pages. Dr. Pettigrew ends by saying that, in carrying out his design to produce a comprehensive view of the circulation, he has been compelled to expunge much that was old and introduce much that was new, and that how far he was right, time and an advanced physiology would determine. There can be no doubt that the book does not contain a great deal that most people would look for in such a treatise, and I shall be much surprised if "time and an advanced physiology" confirm any portion of the "new" physiological views which Dr. Pettigrew has here set forth. C. TROTTER.

COMPARATIVE VIEW OF SANSKRIT AND OTHER LANGUAGES, BY T. H. COLEBROOKE.

Oxford, September, 1874.

I mentioned in my Address before the Aryan section of the Oriental Congress that I possessed some MS. notes of Colebrooke's on Comparative Philology. They were sent to me some time ago by his son, Sir E. Colebrooke, who gave me leave to publish them, if I thought them of sufficient importance. They were written down, as far as we know, about the years 1801 or 1802, and contain long lists of words expressive of some of the most important elements of early civilisation, in Sanskrit, Greek, Latin, Teutonic, Celtic, and Slavonic. Like everything that Colebrooke wrote, these lists are prepared with great care. They exist in rough notes, in a first, and in a second copy. I give them from the second copy, in which many words from less important languages are omitted, and several doubtful comparisons suppressed. I have purposely altered nothing, for the interest of these lists is chiefly historical, showing how, long before the days of Bopp and Grimm, Colebrooke had clearly perceived the relationship of all the principal branches of the Aryan family, and, what is more important, how he had anticipated the historical conclusions which a comparison of the principal words of the great dialects of the Aryan family enables us to draw with regard to the state of civilisation anterior to the first separation of the Aryan race. No one acquainted with the progress which Comparative Philology has made during the last seventy years would think of quoting some of the comparisons here suggested by Colebrooke as authoritative. The restraints which phonetic laws have since imposed on the comparison of words were unknown in his days. But with all that, it is most surprising to see how careful Colebrooke was, even when he had to guess, and how well he succeeded in collecting those words which form the earliest common dictionary of our ancestors, and supply

the only trustworthy materials for a history of the very beginnings of the Aryan race.

GERMAN PHILOLOGICAL CONGRESS.

Innsbruck, Sept. 28.

THE Twenty-ninth Meeting of German Philologists (*Versammlung Deutscher Philologen und Schulmänner*) began to-day, or let us say, rather (since the social element is an essential part of the gathering), began yesterday evening with the "Begrüßung" in the "Redoutensäle." The guests were met at the station by Dr. Jülg, of the University of Innsbruck, who had been chosen president for the year, and were presented with the "Festschriften," the papers dedicated to the present meeting. These include the Programme of the Innsbruck Gymnasium (with papers on the Dative in Virgil, by Dr. H. Dittel; and on the Influence of the old Tyrolese Estates on the Legislation, by Dr. J. Egger), and corresponding offerings from the other Tyrolese and neighbouring schools, viz.: On the Homeric Infinitive, by Professor Simmerle, of Hall; on the Speeches in Thucydides, by Professor Michaeler, of Botzen; Contributions to Homeric Uranology, by Dr. A. Krichenbauer, of Znaim; on the Compound Nouns in Homer and Hesiod, by Dr. Stolz, of Klagenfurt; on the Scholiasts on Horace, by Dr. Petschenig, of Graz; and on the Outline of Europe, by Dr. Schmidt, of Graz.

The proceedings were opened to-day with an address from Dr. Jülg, in which he pointed out the special interest of Innsbruck and the Tyrol for philology and history. The mere list of the names of villages is enough, as he showed; for it contains the traces of the many successive nations that have passed over the country, at once a fastness and a highway between north and south. Dr. Jülg's address was followed by speeches of welcome from high officials of the Tyrol; after which the reading of papers began. The first paper, by Dr. Thomas, the Librarian in Munich, on "Humanismus und Zeitsinn," contrasted the wide and liberal character of the philology of forty years back with the more mechanical spirit in which it is apt to be pursued in the present day—a spirit which he happily characterised by the word "Alexandrinism." Then followed an excellent essay by Professor Arnold, of Würzburg, on the Theatrical Masks of the Ancients. The subject was one which involved a good deal of detail, and which almost required the help of pictorial illustration; but Professor Arnold succeeded in making it thoroughly interesting, partly by the clearness of his arrangement, but still more by the suggestive way in which he connected the use of masks with the ideal character of ancient dramatic art.

The "general sittings" are occupied by Classical Philology, and so much of Archaeology as was likely to be of general interest. The special sections are the "Paedagogic," the Oriental, the German and Romance, the Archaeologica, the section of Comparative Philology, and the section of Modern Languages. The weather has hitherto been such as to show the singular beauty of

Innsbruck to the greatest advantage, and the town wears its gayest dress in honour of its distinguished guests.

Sept. 29.

The meetings of sections began yesterday afternoon. The Paedagogic section met at four, and other sections at six. The most piquant discussion appears to have taken place in the Oriental section, on the authenticity of the latest Moabite inscriptions. Professor Schlottmann defended them. Dr. Wetzstein was the chief assailant.

The general meeting began to-day, at ten. After some preliminary business (in the course of which Rostock was fixed upon for the next meeting), Professor Brunn of Munich read a paper on the head of Demeter, found at Cnidos. After pointing out that Demeter is regarded in Greek mythology as the mother who mourns the loss of her daughter who seeks her painfully, and is finally united with her in a common worship, Professor Brunn showed in detail how this conception was carried out in the work of art in question. The ideal, he argued with much eloquence, was substantially that of the modern "suffering mother," and the profoundest motif of modern religious art was therefore not the fruit of dogma, but was an inheritance common to Greek and Christian. He was followed by Professor Riese of Frankfurt, on the estimate of the Germans formed by the Romans. In this paper an interesting analysis was given of the two main influences at work, the Caesarian sentiment which regarded the Germans if conquered as barbarians, if formidable as treacherous, and the reaction against Imperialism and Roman civilisation which saw in uncivilised races a happier because more "natural" state of mankind.

The origin and growth of the latter influence were skilfully traced, going back to the Abii and Hippemolgi of the Iliad and the Hyperboreans of Hesiod. The next paper was by Professor Schiller of Constance, on the condition and task of the history of the Roman imperial times. It dwelt on the need of fuller study founded on the more abundant materials now available, especially inscriptions. The forenoon was closed by a vigorous and picturesque essay (or declamation) by Professor Köchly, on the "Persae" of Aeschylus. Professor Köchly's theory that the last sheet of the "Persae" is lost has at least the merit of suggesting to him some verses which might have been the translation of an Aeschylean conclusion.

The work of the Sections began as early as eight o'clock. In the Oriental Section Professor Roth gave a statement of the progress of the great St. Petersburg Sanscrit Lexicon, now nearly completed, after the labour of twenty-nine years. Professor Roth's account of this gigantic work, given with touching simplicity, mingled with honest pride and satisfaction, was listened to with the greatest interest and was followed by a special vote of sympathy and congratulation.

Among other papers of interest to Orientalists and linguistic students, may be mentioned that of Professor Lauth, on Ancient Ethiopian Names of Kings; of Dr. Budenz, on the comparative study of the Ugrian Languages; of Dr. Savelsberg, on the Lycian Inscriptions. The last-mentioned scholar added to the "Festgaben" copies of the first part of his *Beiträge zur Entzifferung der lykischer Sprachdenkmäler*. In Section IV. (German and Romance Philology), and Section VII. (Modern Languages)—sections whose province seems difficult to distinguish—there were papers by Professor Bartach on a new translation of Dante (*Inferno*, i.-v.), by Professor Mahn, on the Provençal Language, and Dr. Immanuel Schmidt on the periods of English Literature in connexion with the history of the language, besides several papers relating to the Tyrol. With these last may be mentioned an archaeological contribution by Dr. Oehlenschläger, of Munich. Your readers will understand that this is not even approximately a complete list of the papers, but only a résumé of the recollections of a single visitor.

Oct. 1.

Yesterday (Sept. 30) was employed in an excursion to Botzen, and to-day was the last of the meeting. Some interest was excited by an account given by Professor Schlottmann, of a supposed Phoenician statue found near the town of Syracuse, in the United States. The statue is of colossal size, ten feet in height, and is regarded by Dr. Schlottmann as a representation of Adonis. The circumstances of the discovery seem to exclude the supposition of imposture. Dr. Schlottmann exhibited various photographs, some of them taken while the statue was still *in situ*; but he has been unable to obtain a copy of an inscription which is said to be legible upon it. The speakers who offered remarks on the subject seemed disposed to suspend their judgment until the inscription should be produced. Professor Schlottmann was inclined to believe that Phoenician colonies reached America: pointing on the one hand to the alleged Phoenician inscriptions found in Brazil and other parts of the American continent, and also to certain traces of Phoenician in Indian geographical names; and on the other hand, to the traditions about the island of Atlantis which were current in Greece from the time of Solon.

The foreigner who is more or less familiar with the abundant literature of German philology, and especially with numerous minor works, dissertations, "programmes," degree exercises, of which it is composed, will naturally be led to consider how far previous impressions are confirmed or modified by the "Philologenversammlung." The most prominent tendency is towards an extreme specialisation, a laborious investigation of points of constantly diminishing interest, a mechanical style of work, and a consequent falling off in the value of philology as an instrument of liberal education. These dangers are already perceived in Germany, and, in fact, were the chief subject of the thoughtful address of Dr. Thomas. It may be said that they do not meet us so much in the science of language as in the older Philology proper, i.e., the interpretation of ancient texts: but, valuable as the scientific study of language is, it does not replace the study of literature, still less the study of the history of thought. In such a case, however, the perception of the evil goes a long way towards the cure. The essays read to the Innsbruck meeting were marked for the most part by two hopeful qualities, hitherto too often wanting in German philological writing; clear and interesting arrangement of materials, and perception of the bearing of minute enquiry on the general results of knowledge. As a special fruit of the latter quality may be noticed the effort to connect the different branches of enquiry; Professor Riese, for example, showed how a literary tradition as old as Homer might seriously influence the political relations between Rome and the Teutonic nations.

D. B. MONRO.

MEETINGS OF SOCIETIES.

ROYAL MICROSCOPICAL SOCIETY (*Wednesday, October 7*).

CHARLES BROOKE, Esq., F.R.S., in the chair. A paper, by Alfred Saunders, Esq., entitled "Supplementary Remarks on Appendicularia," was read by the secretary, correcting some previous errors, and describing what appears to be a new species, though the author abstained from naming it as such. In another paper by Mr. Fitton, of Norwich, several new diatoms were described from New Zealand and Panama. Amongst them a very fine *Triceratium*, considered to be a variety of *T. favus*, though having seven angles. Mr. Slack, in presenting a slide of silica films to the Society, explained that the deposit was made by passing silicic fluoride gas through four parts of glycerine and one of water. The structure of some of these films could not be well shown with large-angled glasses and large-angled condensers, but became clear with small-angled glasses, if well corrected,

and dark ground illumination with Mr. Wenham's apparatus. Mr. Badcock exhibited a very curious living object remarkable for rapid movements of contraction and extension of two long appendages, and a shorter one springing from two rounded bladders. It was conjectured to be a hitherto unrecognised larval form of some entozoon.

NEW SHAKSPEARE SOCIETY.—(Friday, Oct. 9.)

MR. SIMPSON read his paper on "The Political Allusions in Shakspeare's Chronicle Plays." After stating that these allusions would be found to apply not so much to events as to principles in controversy, he went on to discuss the seven reigns with which these dramas deal, to trace the poet's departures from the chronicles, to infer the intention which dictated these alterations, and then, comparing this intention with the circumstances and controversies of the day, to discover the bias of the author, and the lesson which he intended to be gathered. Thus he treated *King John* in reference to the controversies on the title and succession to the Crown, and the aid upon which the competitors counted; *King Richard* in reference to the grievances of 1592-3; *Henry IV.* in reference to the Rebellion in the North, or rather to the discontent of which that Rebellion was the gravest symptom. *Henry V.* in reference to the political scheme of the Essexian party. In the part concerning *Henry VII.* Mr. Simpson introduced a discussion of a single historical clue which he traced through all the plays, namely, the consistent development of the history of the English nobility. He illustrated this point from the literature of the day. He did not find many political allusions of any consequence in *Richard III.* and *Henry VIII.* In conclusion, he made a few remarks on the political bias of the poet's mind.

NOTES AND NEWS.

Effects of the Division of the Semicircular Canals of the Ear.—In Dr. Knapp's *Archives of Ophthalmology and Otology*, just published (vol. iii., no. 2, p. 26), Dr. Löwenberg, of Paris, gives the results of a series of researches he has undertaken on the effects of division of the semicircular canals. It is well known that Flourens observed some peculiar derangements of motion in animals in which he had cut these canals, chiefly consisting in rotatory movements of the head and of the body. Löwenberg in repeating these experiments satisfied himself that accidental injury of portions of the brain cannot be considered as constituting a cause of these remarkable phenomena. He did not find that vomiting was a constant sequence of injury to the semicircular canals, as Professor Czermak had declared. His experiences prove the following points:—(1) That the derangements of motion are the result of irritation of the membranous canals and not of paralysis; (2) that the irritation of the semicircular canals produces the convulsive movements *reflectively*, without participation of consciousness. Consciousness participates in these effects only in so far as it gives rise to renewed irritation by inciting the animal to voluntary movement; (3) the communication of this reflex excitation from the nerves of the membranous semicircular canals to the motor nerves takes place in the thalamus.

In an appendix to this paper Dr. Löwenberg gives also some experiments he made on the division of the auditory nerve in rabbits. For this purpose the knife was carried into the tympanum forwards and upwards. There immediately followed the characteristic movements of the head from right to left, and in addition the "mouvements de manège." The right ear seemed to have lost its hearing power. The "mouvements de manège" continued for several days, but diminished in intensity during sleep. If the animal were shaken or struck they increased in violence. On the third day the animal was killed. The

dissection showed that while the right auditory nerve was almost completely divided, at the same time the semicircular canals of this side were partly crushed. This occurred in all cases. The substance of the brain was not injured; vomiting was not observed; derangements of motion only occurred when the injury was unilateral.

Movement of Rotation of the Hand.—The common theory of the rotation of the hand is that the radius alone moves around the ulna in the rotation of the forearm and hand. Dr. O. Lecomte contests this view, and in an article in the *Archives Générales de Médecine* maintains that the rotation of the forearm and hand is executed by the simultaneous, harmonious, and similar movement of both bones of the forearm, the radius and the ulna; and that the rotation of the hand is not an unique movement. One principal mode of rotation may be admitted around a median axis, which is the prolongation of the line of the third metacarpal bone and middle finger, but the axis of this movement may be displaced either inwards or outwards, and thus secondary modes of rotation of the hand are produced around axes passing through each of the other fingers or the intermediate spaces. The play of articulations in the movements of rotation is very complex. At the elbow, notably, the humero-cubital articulation plays an important part. The ulna executes on the trochlea of the humerus a movement of spiral torsion, which may vary in extent, but which is present in all the modes of rotation. The system of the rotator muscles of the hand comprises four muscles; two for the radius, two for the ulna. Each of these bones has a pronator and a supinator. There is a radial pronator (the pronator teres); and a radial supinator (the supinator brevis); an ulnar pronator (the anconeus); and an ulnar supinator (pronator quadratus).

Reflex Actions of the Brain.—A treatise of about 200 pages has just been published by J. Luys, of the Salpêtrière (well known for his researches on the microscopic anatomy of the brain and spinal cord) on the Physiology of the Brain, and especially on its reflex actions. We have only space here to give some excerpts from the *résumé* at the end, but the work is worth reading, and is illustrated by two plates and photographs. The activity of the brain, he says, is governed by the same laws and the same conditions of the organic mechanism which preside over the activity of the different segments of the spinal axis and medulla oblongata. Its activity is decomposable into a series of reflex processes which are evolved as a result of the reaction of the preformed organic substratum, and the natural play of the various forces excited to activity. Every reflex process is composed of three successive periods intimately connected with each other: a period of incidence, an intermediate period, and a period of reflexion. The first is always an impression irradiated from a sensory plexus, a centripetal impression, conscious or unconscious, and marks the *début* of the whole phenomenon, and it is always an attendant or *satellite motor* reaction that completes it. In the brain, as in the spinal cord, there is a system of zones or cells disposed for the reception of centripetal impressions, and a system of zones disposed for the emission of motor excitations. These two systems are united in an inextinguishable solidarity; they constitute a complete whole, and a veritable dynamic unity, across which the nervous currents are propagated. Physiological research shows that it is in the networks of the cortical substance of the brain that sensory impressions of all kinds reach their ultimate stage, taking from this point a new form, and becoming transformed into psychical incitations, which again lead to movement. The networks of the cortical substance therefore represent a vast common reserve for all impressions belonging either to animal or vegetable life; and in a physiological point of view a synthesis of all the partial sensibilities of the organ, i.e. the *sensorium commune*. On the other hand, the experiments of Flourens and Ferrier have shown that there exist

in the cortical substance of the brain a series of isolated and independent motor centres governing certain groups of muscles. A cerebral reflex process differs from a spinal one in its being amplified and transformed by the proper action of the exclusively cerebral nervous element interposed in its course. After dealing in detail with the several stages of the reflex processes taking place in the brain, Dr. Luys remarks that "the action of emitting voluntary articulate sounds—speech—presents in its physiological evolution the highest expression of cerebral activity. It is decomposable, like all the dynamic manifestations of the same type, into a series of successive and intimately associated phenomena. The *processus* which constitute it may be stated thus: first, a period of incidence which corresponds to the arrival of the acoustic impression, and into its diffusion in the regions of the brain specially destined to receive it; secondly, into a period of propagation during which the molecular changes or vibrations reach the purely intellectual regions, and lead to the participation of the conscious individual; thirdly, into a period of reflexion, in which the excitations in their primordial succession, after being propagated throughout the whole extent of the cortical network, and having excited the active forces of its elements, are exported outwards as a synthesis of multiple activities, and pass into the region of automatic activity, which then translates them into precise articulate sounds. He then shows how speech essentially results from the synergic action of a psycho-intellectual and of an automatic sphere of nervous activity, the former comprehending the affection of the sensorium and subsequently of the conscious individual, the latter embracing the integrated and co-ordinated translation of the sensorial excitation. Anatomically, this last commences in the deep zones of cells of the cortex of the brain, and is conducted through the whole cortical striated fibres, then through the grey substance of the corpus striatum and of the pons, and terminates in the nuclei of origin of the hypoglossals and of spinal nerves, which convey the impulses to the muscles effecting phonation.

Mechanism of Rumination.—At the meeting of the French Association for the Advancement of Science (held August 24, 1874), M. Toussaint read a paper on this subject, in which he stated that he had been very successful in obtaining tracings by the graphic method of this complex process. The chief result of his researches has been to show that the food, associated with a large quantity of fluid, rises in the mouth during rumination, as an effect of atmospheric pressure.

REPORTS made to the French Academy of Sciences of operations performed during anaesthesia, produced by injecting a solution of chloral into a vein, give curious particulars of the action of that substance. In one case the injection commenced at 4.35 p.m. In one minute twenty-five centigrammes were introduced, and in another minute the quantity amounted to one gramme. Nothing particular happened to the patient up to 5.30 p.m. At 5.40 one and a half grammes had been introduced, and by 5.42 two grammes. These doses caused the rate of the pulse to diminish and the patient's utterance to be slow. When two and a half grammes of the solution had been passed into the vein the patient professed to be a little sleepy, but chattered. At 5.47, when three grammes had been employed, the sensibility of the skin was blunted and the thoughts wandered. Successive additions, at last amounting to seven grammes in all, brought on complete insensibility at 6.15 o'clock. The operation for removing a cancer then began, and during the few minutes it occupied, another injection of 50 centigrammes was made. At 6.35, the surgery being over, attempts were made to wake the patient by electric shocks, flagellation with wet towels, ammoniacal vapours, &c., but in vain. It was then decided to leave him alone, and

wait the result. At 8h. 30m. he seemed slightly sensitive when pinched; at 9 he could answer questions, but went to sleep again. At 5 A.M. the next evening he awoke, and then slept a little longer. At 6 he seemed well, but was still somewhat confused. His return to a normal state occupied two days, the complete anaesthesia having lasted two hours.

In another case, reported by M. Oré, the originator of the plan, the chloral solution was employed because the patient, on a previous occasion, had been dangerously affected by chloroform. Insensibility was produced in seven minutes, and maintained from 9 A.M. till midday. An operation for removing a cancerous tumour occupied three quarters of an hour. Sensation began to reappear at noon, and a calm sleep ensued, which lasted till the following day. In both cases, and in a third one, the cures progressed satisfactorily.

The probable action of chloral on the system would appear from experiments of M. Tanret to arise from its decomposition when it comes into contact with oxidising substances and the alkaline serum of the blood. Carbonic oxide would then be evolved, and Claude Bernard has shown that gas to be capable of combining with blood globules, displacing their oxygen and rendering them unfit for their physiological functions.

Among the interesting papers in the September number of the *American Naturalist*, we notice one by Dr. G. Linecum on "The Agricultural Ant, *Myrmica molefaciens*." In 1848 there was but one city of these ants within a mile of Long Point, "situated in a nearly barren little spot, on the top of an elevation underlaid with stratified sandstone. . . . The ant-ridge, which they so carefully cultivate, was flourishing in a regular circle near the outer border, but inside the pavement." At that time the surrounding country was covered with a dense crop of grass through which the ants could not travel; but when a road passing near their pavement had been tramped out in the deep grass, they made use of it, and commenced building new cities, the first being about eighty yards from the old one and a little off the track. Others succeeded at about equal distances for a mile, and as the introduction of cattle led to the formation of more tracks, the ant-buildings increased. Dr. Linecum says that they hide the entrance to a new city with bits of stick, earth, &c., until it is strong enough for defence, and then they clear out and pave a circular space round it. In some old settlements there are central mounds a foot high, and a pavement round it fifteen feet in diameter. They do not throw off swarms, like bees, but on a summer day males and females, both winged, assemble from various ant cities, and indulge in a very rampant courtship, three or four males struggling for one female. After this form of primitive marriage the females escape from their lovers, and, after a little rest, settle on a convenient spot and begin digging small holes. As the holes deepen they find their wings in the way, and, as Dr. Linecum says, "with their sharp mandibles clip them off." Having sunk her little pit six or seven inches, the female makes a small cell at the bottom, and closes the top. In this retreat she sleeps nine or ten days, and if she survives, comes out for food, goes to work, and deposits twenty or thirty eggs, which all develop into workers, and she is seen outside no more. In about eighteen months the population is strong enough to throw off disguise, the entrance is no longer concealed, and the construction of the mound and the pavement begins. They store away quantities of small seeds for their winter support, and if water gets into their granaries in rainy weather, they bring the wet seed out to dry on a fine day. On one occasion Dr. Linecum saw them sunning as much as a gallon of wheat on a flat rock in a farm, and in the evening "their hosts carried it off in five minutes." The males die by thousands after their connubial exertions,

and many birds devour the females, and keep down their numbers.

In another paper Mr. Bailey mentions the swamp azalea (*A. viscosa*) as a fly-catcher with the clammy hairs outside its corolla, and he solicits the attention of other observers with a view to ascertain if any process of digestion occurs.

Mr. AUG. R. GROTE objects to the division of Lepidoptera into Rhopalocera, or club-horned, and Heterocera or diversely horned, as he traces a gradual transition "from neuropteriform antennae of the Tineidae, or lowest moths, to the butterfly-like antennae of the Castniidae or highest moths." Nightflyers require more aid from antennae, he considers, than day-flyers, and he finds the antennae of the former more specialised. He thinks that the senses of smell and hearing are not differentiated in insects, and that antennae subserve both functions, but it is difficult to understand how atmospheric pulsations and the very delicate action of odours can be appreciated by the same organ.

MR. A. S. PACKARD points to some curious facts in the distribution of spiracles and tracheal branches in several groups of insects which bear upon the doctrines of development. He finds, for example, that "while no known hymenopterous larva has more than two pairs of spiracles on the thorax, yet three pairs may be found on different rings in different groups, though not actually existing in one individual." In the larva of *Corydalus* he notices "that the main tracheae suddenly enlarge from the second abdominal spiracle to the base of the head, when they subdivide and distribute branches to the head. From the spiracle on the basal abdominal segment a trachea as large as the anterior swollen portion of the minor trachea, takes its origin, and passes directly under the main trachea. Both send branches to where the mesothoracic stigma (external opening of trachea) should be if it were present." The doubling of the tracheae serves to lighten the anterior and heavier portion of the body, and Mr. Packard considers that this arrangement sustains the view of Gegenbaur that the tracheae were first air-bladders and afterwards performed the function of respiration. Such facts as the variations in the spiracle-bearing segments, he thinks, point to an ancestry that united the peculiarities.

MR. J. A. ALLEN describes the difference between birds of the same groups belonging to Northern and Southern American stations. From north, southward, he traces a general reduction of size, except as regards the bills, which become larger and stouter, or, if slender, longer, more attenuated, and with a disposition to curve, and the claws, which have a tendency to increase, especially the great toe. The tails also in many cases elongate southward. The colours become more intense, and dark markings increase at the expense of lighter spots. While admitting the effects of natural selection and sexual selection, he believes "climate and other environing conditions take a larger share in the work than the majority of evolutionists seem willing to admit."

FRANCE has just lost her most illustrious geologist, Elie de Beaumont, who died on September 22. He was born in 1798, and entered the École Polytechnique in 1817, whence he went to the École des Mines, the seat of his labours for fifty years. England having published a fine geological map, Brochaut de Villars, Director of the École des Mines, was required by the administration to prepare a similar one of France, and in company with Elie de Beaumont and M. Dufrenoy, visited England to acquire the information indispensable for the undertaking. On their return they entered on their work, which is a lasting honour to the three engineers.

In 1827, M. Elie de Beaumont first published his memoir relative to the comparative ages of mountains. Towards the end of the last century

Werner had established the order in which the strata of the world's crust had been deposited, and Cuvier and Brongniart have shown that each stratum has its characteristic fauna and flora, the fossil imprisoned in its stony cell showing to after ages what were the animals and plants of the first ages of the earth. What Werner had demonstrated regarding the successive strata of our planet, Elie de Beaumont effected for mountains. He discovered the order of their formation, and proved their relative ages. As he expresses it himself:—

"Dans ce vaste ensemble de caractères par lesquels la marche du temps a gravé l'histoire du globe sur sa surface, les montagnes sont les lettres majuscules de cet immense manuscrit, et chaque système de montagnes en constitue un chapitre."

On the death of Arago, he was appointed his successor in the Academy of Sciences, and on that of Cuvier, to the chair of natural history at the Collège de France. Inspector-General of Mines, Perpetual Secretary of the Academy of Sciences, Senator, Great Officer of the Legion of Honour, Elie de Beaumont has attained everything to honour his career. He had asked nothing, all was voluntarily conferred upon him. He died where he was born, in the château of Canon, near Lisieux, in the seventy-fourth year of his age. As M. Dumas said in the speech made at his funeral:—

"La manière de travailler de M. Elie de Beaumont et le tour de son génie se révèlent tout entiers dans ces trois circonstances; les matériaux sur lesquels va se fonder sa doctrine sont recueillis avec patience et contrôlés avec une rigoureuse exactitude; sa vive imagination en tire des conséquences sublimes, sa pitié les rattache sans effort aux textes sacrés. Observateur infatigable, persévérant et sûr; poète à sa manière et poète passionné par toutes les idées élevées; chrétien toujours, et chrétien convaincu; tel se montrait Elie de Beaumont dans cette œuvre admirable de sa jeunesse, tel il est resté toute sa vie."

FINE ART.

Art Teaching of the Primitive Church. By the Rev. R. St. John Tyrwhitt, M.A. (London: Society for Promoting Christian Knowledge, 1874).

WE observe two prevailing yet antagonistic tendencies in the religious movement now manifest around us—one receding to a greater distance than ever from the conclusions and dogmatic absolutism of the ancient Church; the other returning nearer to the aesthetic spirit and devotional feeling of mediæval Christianity. Distinct in the recent literature of different countries is the utterance of one or other of these tendencies so strikingly apparent among ourselves; while there are not a few works, written from a high stand-point, which may be considered the expression of thoughts that sympathise with both, aiming at the harmonious reconciliation of the spirit of the past with the genius, the requirements, and intelligence of the present. It is not, indeed, surprising, that earnest and independent minds, especially among learned members of the sacred profession, should be led to feel and own that the Protestant Reform inherited far too much from the dogmatic spirit of the old Catholicism, while it unfortunately lost much of the comprehensiveness, and the profound experience of human wants, weaknesses, and capacities, which distinguish the wonderful ecclesiastical system under the supremacy of Pontifical

Rome. The author of the work above-named may, I believe, be allowed a place among the representatives of the higher and more salutary movement—that which aims at excellence, truth, and beauty in outward appeals and agency, desiring to admit all from all sources, provided that all contribute to the promotion of true religious interests—to that elevation of the life and purposes of man which is the practical result, while it is assuredly the noblest triumph, of Christianity. It is not enough to say that Mr. Tyrwhitt's book is full of learning, ably brought to bear on his theme; it is also full of wisdom, of thought that suggests other thought, of reflective estimate concerning principles at stake, interests that are involved in the oppositions of the religious temper or proclivities, in the questions as to devotional practice which have lately occupied so many minds. He argues temperately for the admission of art and symbolism among appeals to faith and piety.

"If" (he says) "this means of teaching be neglected or forbidden, a means of instruction is closed which all theists must consider divinely appointed. The world suffers accordingly. Men are deprived of light, of sweetness, of fresh and right thoughts."

And this observation is backed by arguments that rest on historic grounds, e.g., the here justly adduced proofs that, in the East, the furious iconoclasm which was, in fact, an imperial reform enforced by military violence, had effects which were evil and barbarising.

The question as to the nature of the influences that can be safely allowed to sacred art, and the source of impressions that can have no degrading effect among those usually received from painting, sculpture, or mosaic admitted within church or oratory, is met by our author with a decision asserting the purely subjective nature, having its seat, namely, in the artist's mind, of such impressions and influences. Thus does he define the limits of the true and rational *edification* which art-creations are capable of conveying to the devotional mind in their most elevated sphere:—

"They show" (to the spectator) "beyond doubt, that another man, of the highest powers, has here and hereby given his heart to God. The picture is a monument of the soul's desire of its author—it is an evidence that his soul desired the kingdom of God; and so far it is his witness on earth to that kingdom. When great human genius, labour, and sacrifices have evidently been applied to works in this department of intellect, we are, or ought to be, edified."

The "Index of Subjects, Historical and Emblematic," at the end of this volume, is much more than a mere index—an analysis, critical and expository, of the popular art themes sanctioned by the Church from earliest times; the section on "Miniatures" being not only the most lengthy, but the most carefully compiled and exhaustive.

One might object to the diffuseness, and occasionally too didactic tone assumed by the author. In some instances one finds errors that may be corrected by many readers; in others, mistakes less palpable, that betray the want of personal acquaintance with, or of investigation *in situ* directed to, the artistic or other antiques in question.

That energetic discoverer in the range of Roman catacombs, the courageous Bosio, is twice styled a "cardinal," once mentioned as "an Oratorian," in these pages. He was neither, nor ever embarked in the ecclesiastical career, being the laic representative of the Knights of Malta, during the last years of the sixteenth century, at Rome. In one place it is stated that "the Passion carvings seem probably not earlier than the sixth century. They do not go further than the representation of our Lord before Pilate." This is incorrect, for that same subject, Christ before Pilate, who is washing his hands, is seen among the sculptures on a sarcophagus, now in the Lateran Museum, considered by good critics to be not more modern than the fourth century. The rarity of statues, among works of the earlier period (Christian), is somewhat overstated in the chapter on "Christian Sculptures." That of St. Hippolytus, a life-size seated statue, much restored (the head entirely modern), and a singularly pleasing statuette of the Good Shepherd (both in the same museum), are less exceptional works of their class than is here assumed. Statuettes, generally very rude, of the "Pastor Bonus" have been found in not few examples at Rome, and in the subterranean cemeteries. One, in which the advanced age indicated and the supposed likeness to St. Peter attract notice was exhumed below the ancient church of St. Clement, so long buried before being recently re-opened. The statement that "the original emblem of the four Evangelists is the four rivers of Paradise," must be qualified when one refers to another, undoubtedly of high antiquity, if not (as probable) of the Constantinian period—the emblem, namely, of four jewelled books, painted at the juncture of the arms of a large cross, also jewelled, on the vault of a hall belonging to the *Thermae of Trajan*, consecrated for Christian worship by Pope Sylvester in the time of Constantine, and still serving as a crypt chapel below the church of SS. Martino e Silvestro on the Esquiline Hill.

The notice of the mosaics (of the fifth century) in the church of S. Sabina, at Rome, as "grand and historical—commenced in 424," is unfortunately no longer correct, the author having drawn his particulars from some account of what those mosaics once were, but are no longer. That fine old Dominican church was tastelessly embellished and altered by Sixtus V.; and in the course of the modernising process two figures alone, representing the Judaic and Christian Covenants, were spared out of the large mosaic composition (SS. Peter and Paul, the four Evangelic Emblems, &c.), which formerly covered the wall-surface above the chief doorway. The "unique picture of the fish bearing loaves," as our author designates one of those in the Roman catacombs, is precisely such as described by De Rossi and Dr. Northcote: on the back of the swimming fish being placed a basket, in which, together with loaves, we see a phial of red wine—of course sacramental, as is the other species. The tone of doubt in which this is alluded to induces me to attest, from memory of the original, the correctness of the two last-named gentlemen in what

they write respecting that symbolic picture—evidently of profound significance.

C. I. HEMANS.

NOTES AND NEWS.

THE Musée des Souverains, in the Louvre, whose fine collection of royal relics was dispersed by the fiat of the republic, is now appropriated to the reception of the Museum of American Antiquities. The collection, formed principally by M. Angrand, is small, but contains many specimens of remarkable workmanship. Over the chimney-piece is placed the Mexican zodiac, which also served as a calendar, and is fully described by Baron Humboldt in his *Sites des Cordillères et Monuments des Peuples indigènes de l'Amérique*. Large stones, upon which are carved the principal lines of this very complicated sculpture, served for altars of sacrifice. Among other stone sculptures worked by the Mexicans, without the assistance of iron which they did not know, but by means of bronze instruments are—Tocozintli, goddess of plenty; the wolf-god; the gigantic toad, symbol of the Tamaçolan tribe; the serpent in whose throat is a human head, symbol of Acamapitçhli, a king of Mexico; and Cihua Coahuatl, the woman serpent, or the Mexican Cybele.

Small terra-cotta statuettes represent the principal Mexican divinities, among which figures Huitzilpochtli, god of war, to whom so many human victims were sacrificed upon the stone altars mentioned above. These all exhibit varied styles of art, as if belonging to different races by whom the country has been successively peopled. The flattened heads of some are specially deserving of notice.

The collection contains various arrow-heads and knives made of obsidian, but none of those remarkable specimens encrusted with turquoises, such as the mask formed out of a human skull, coated with turquoises and obsidian, the eyeballs formed of iron pyrites, and another of wood with similar decorations, which we have in the Christy collection, and which were probably used in the Aztec religious ceremonies, and brought to Europe soon after the conquest of Mexico.

To the Peruvians belong the arrow and spear-heads of siliceous stone, the hatchets of lava, and the star-shaped heads for maces, pierced in the centre to receive the wooden handle.

Among the specimens of Peruvian pottery are those beautiful double and triple receptacles, some in the shape of animals, others representing the human lineaments of great originality, and of such truthfulness of style and perfection of workmanship, that many might be regarded as the products of Egyptian or Greek Art. Some little cradles, one containing a sleeping infant, were probably *ex voto*, such as we find in all nations, ancient and modern.

Works in the precious metals are rare: a Peruvian vessel of silver, destined for the use of the Incas, is a sole example; probably all were melted down by the Spaniards. The works of the potter alone have been spared, as evidences of the extensive advancement of these people in arts and civilisation.

THE *Chronique* reports that the celebrated Italian photographers, MM. Alinari, of Florence, are executing some important works for Mr. Ruskin. Several of Sandro Botticelli's greatest works in particular have been photographed by them, the size of the original, and with all the details reproduced in a marvellous manner.

AN Italian architect named Ludovico Stanziani, who had acquired a high position in Russia, in which country he had resided since his youth, has left by his will the greater part of his large fortune and a rich collection of medals to an artistic society in Rome, called the "Virtuosi of the Pantheon," for the purpose of founding a capital to enable three young artists—painters, sculptors, or

architects—to continue their artistic studies without expense. Stanziani died in 1872, but, owing to legal difficulties, the Society of Virtuosi have only lately entered into possession of the legacy. The first competition for the scholarship will take place as soon as everything can be arranged.

THE magnificent new church of St. Nicholas in Hamburg is now finished. When the great cross was placed on the summit of its spire, it was found to have a total height of 472 feet. This is higher than that of the Münster at Strasburg, which has hitherto boasted of having "the highest spire in Europe."

WE have received the first two numbers of a new monthly review that has been put forth by the *Union Centrale* in the interests of art as applied to industry. It is called the *Bulletin de l'Union Centrale*, and the first number contains a statement of the aims of the *Union*, the names of its members, and some details as to its organisation. The second number is chiefly occupied with the question of art teaching in the various schools of design, *apropos* of the drawings of the art schools that formed part of the recent exhibition of the *Union Centrale* at the Champs Elysées.

THE *Chronique* states that the classing of the pictures in the Louvre in chronological order will soon be accomplished, and that it is probable that the galleries devoted to the Italian schools will be reopened to the public this month. The paintings by the early Italian masters will be placed in the gallery called "des Sept Mètres," and the others will follow according to their dates in the grand galleries overlooking the Seine. The paintings by Rubens, contrary to what has been stated, will, it is now thought, remain in their present position, but the other Flemish paintings will most likely be removed from the galleries of the second story to the two new galleries recently finished by M. Lessuel.

THE Bolognese have decided to erect a monument to Galvani, the great Bolognese physician who discovered animal electricity.

THE Neapolitan artist Eurisio Capocci has been commissioned by a committee, formed for that purpose at Florence, to paint a great national picture representing the Roman deputation that brought to the King of Italy the result of the plébiscite that united Rome with the rest of Italy. The picture, when finished, is to be presented to the King, to be placed in the Quirinal. The Florence Committee has asked all the Italian municipalities to associate with them in this project, so as to give it a distinctly national character.

A NEW and illustrated catalogue of the splendid collection of armour in the Royal Museum at Turin is announced for 1875. It has been compiled by M. le Comte de Seyssel, the Conservator of the Museum, and will no doubt possess great interest. A series of photographs from some of the finest specimens in the Museum has been published by M. Antonio Perrini, of Venice, but no adequate description of the riches of the Reale Armeria of Turin has ever yet been written. The old catalogue was worse than useless.

THE committee of the Michael Angelo centenary celebration promise a programme of proceedings in a few weeks' time. The subject has been taken up with the warmest interest all through Italy, and it seems fully determined that on the fourth centenary of Michael Angelo's birth (that is on March 6, 1875) a great national festival shall be held, that shall be in every sense worthy of the world-famous artist. The Provincial Council of Florence have promised 1,000 fr. towards expenses; and several artists, it is said, have offered to restore the façade of Michael Angelo's house, an offer that has been accepted by the committee.

ON the occasion of the Ariosto centenary, recently celebrated at Ileggio da Modena, a medal was struck with the well-known portrait of Ariosto by Titian engraved upon it.

MR. E. M. WARD's popular picture of *Luther reading the Bible* has been bought by subscription, and given to the British and Foreign Bible Society. It may now be seen in the Society's new offices in Queen Victoria Street.

THE jury charged to decide upon the models for the statue to be erected at Mâcon to Lamartine, have adjudged the first prize of 3,000 francs to M. Falguière.

AN interesting archaeological discovery has been made at Malta. Some workmen digging in the environs of Marsa, have come upon an ancient cemetery, hewn in the rock, almost on the surface of the soil. Various works appeared to have been begun to convert the excavation into a water tank. The cemetery has the form of an irregular parallelogram, divided into two chambers of unequal size, the lesser one separated by a solid wall cut in the rock, and pierced by a door opening upon two vestibules. The only objects of interest which have been found are the heart-shaped buckles of bronze, and several small earthen lamps, in bad preservation.

THE restoration of the Rottmann frescoes at Munich has been completed, and the landscapes with King Ludwig's distiches under the arcades are again exposed to view.

ANSELM FEUERBACH, the finest historical painter of Germany, is said to be charged with a commission to paint the wall-pictures of several public buildings in Vienna: a fact which may account for the absence of his name in the list of the painters in the Berlin Exhibition this autumn.

THE *Nation* states that the long-awaited Montpensier collection opened on Monday, September 21, at the rooms of the Boston Art Museum, and contains, amidst a good deal of the heavy platitudes of commonplace Spanish art, a few pictures of great value. The chief in point of merely artistic interest is, a portrait by Velasquez of a head, with indications of a lace collar and scarcely a hint of the shoulders—a most masterly lesson of the qualities of great portraiture, technically invaluable to art-students. The Murillo, a picture of modest pretension in point of size, is one of the most favourable examples of the master amongst the smaller pictures, carefully painted, agreeably composed, and mostly well preserved, the best and least retouched part of it being indeed as excellent painting as anything to be found among the painter's works. Parts of it have been retouched crudely, to the disadvantage of the *ensemble*; but, as a whole, it is an excellent and characteristic example of Murillo's sacred vein. Of four pictures by Zurbaran, one, an *Adoration of the Magi*, is in the very best vein of this master, and is in execution, in naïveté of composition, and in quality of wear worthy a place amongst the great masters. The others of the series are more or less weak and heavy compared with this. Only six of the twenty-one Spanish pictures are in any way noteworthy, while of the Italian schools there is no representative of any great master, and good ones only of Salvator Rosa, who has two landscapes, of which one is excellent. A single example of ascetic Spanish art, a *Pietà* by Morales, dry, hard, and painful as it is, is of great interest. There is also a single picture ascribed to Sebastian del Piombo.

THE Vienna papers state that at Stuhlweissenburg, where excavations have been going on for some time, there has been laid open half of a basilica. Inscriptions upon the Roman stones employed in its construction show in an indisputable manner that this town is built upon the site of Kemania, the capital of ancient Pannonia. It is reported that Professor Mommsen is on his way to the site to study these inscriptions.

THE recently built St. Nicolai-Kirche at Hamburg may now be said to have received its last touch by the successful erection of the cross on its noble tower. The church of St. Nicholas, together with the old St. Petri church, were both more or less completely destroyed in the great

fire at Hamburg in 1842, but while the condition of the main walls of the latter admitted of immediate and less costly restoration the former was so thoroughly gutted by the flames that it was found necessary to build it up again from the very foundations. When the question of its entire re-building was first mooted the scheme met with great opposition on the ground of expense, and also because in accordance with the opinions of a large and influential portion of the inhabitants it was considered that several small churches in different parts of the city would better meet the religious requirements of the community than any large church. There seemed for a time every probability that these more prudent considerations would prevail, but when the various plans were examined which had been tendered for the restoration of the church, Mr. Gilbert Scott's design was found to be so perfect of its kind that its adoption was at once determined upon, and it was felt that to secure so great an ornament to the city as his plan promised to give to it, a large pecuniary outlay might not unreasonably be incurred. The scarcity of money at the time, and the numerous calls for unavoidable expenditure, were serious obstacles to the acceptance of Mr. Scott's plans, but the patriotic desire of embellishing the city with a building worthy of its importance, and in harmony with the requirements of modern art, prevailed over all opposition, and the happy thought having been suggested by Herr Porth, to demand a weekly farthing-donation in every district of Hamburg, the experiment was made with the signal success of collecting in the course of the first year upwards of 36,000 thaler. Thus encouraged, the building committee at once proceeded to carry out the designs of Mr. Scott, and when in 1863, on the occasion of the consecration of the church, the question arose whether sufficient funds could be obtained for the building of a tower, Herr Porth again came forward with a suggestion which was followed by equally favourable results, for, by means of his appeal to the wealthy citizens of Hamburg for a daily contribution of a farthing, he obtained before the close of 1873 upwards of 136,000 thaler, making in all 400,000 thaler, as the result of his ingenious method of raising money. The entire cost of the building, which was begun in 1846, has been nearly one and a half million thaler, two-thirds of which have been contributed through private channels. In the opinion of the most competent German connoisseurs, the church of St. Nicholas is the first successful modern specimen of pure Gothic architecture that has been made in any part of the Continent, and the universal admiration that his edifice excites in Germany is a gratifying tribute to the practical skill, technical knowledge, and artistic feeling of our countryman.

THE STAGE.

Giroflé-Girofla has been the piece of the week. It has been done into English with greater and more intentional exactitude than the version at the Gaiety of *Les Cents Vierges* of the same composer. The piece itself is, among light operas, of quite exceptional excellence—we cannot say as much for the performance. It has already, we believe, been pointed out in these columns, as elsewhere, in what respects the latest opera of Lecocq gains upon the most popular of his earlier ones, *La Fille de Madame Angot*. The composer has worked with a more easily intelligible plot, and for the best dance music ever heard in the streets he has substituted music which aims higher and reaches higher. But looking at it with a playgoer's, rather than a musician's interest, we should say that his second act in *Giroflé-Girofla* is a bad one—for purposes of the story it is just about as useful as the middle volume of most three volume novels. The musical excellence of the work will send people to the distant heights of Islington—to hear such music, wise

men might go even further than to the Philharmonic—and it must be remembered that the opportunities of hearing it all in French, in the Strand, when M. Humbert's company was in town, last season, were too few for very many of us. So the piece will succeed very well in Islington, where Miss Julia Mathews plays the twin heroines with more smartness than *naïveté*, where Miss Everard plays *Aurore*, Mdlle. Manetti *Pedro*, and Mr. Rosenthal *Moursourck*. Mr. E. W. Garden is *Bolero*; and Mr. W. H. Fisher, who was seen last at the Olympic, we believe, displays his tenor voice in *Marasquin*.

THE theatrical prospects for the autumn do not seem to be by any means brilliant. Beyond the forthcoming performance of *Hamlet* at the Lyceum—which, in any case, will engage for awhile the attention of the town—and the early production of two pieces, one by Mr. Gilbert, the other by Mr. Byron, there is little promised us just now at the theatres.

THE *Broken Branch* will very soon be withdrawn from performance at the Opéra Comique.

MR. SOTHERN appears this evening at the Haymarket, and with him Miss Walton, of the Fifth Avenue Theatre, New York, who makes on this occasion her first appearance in England.

Romeo and Juliet will be performed at Manchester about the end of the month, under the direction of Mr. Calvert. A hitherto little known actress, Miss Gainsborough, is to play *Juliet*.

AT the Paris Vaudeville, a new four-act piece, *Marcelle*, by MM. Dennery and Brésil, was announced for production on Wednesday evening. MM. Saint-Germain and Parade are included in the cast, but no actress of much fame. Mdlle. Fargueil, for so long the chief artist of this theatre, has lately withdrawn from the company.

Don Juan d'Autriche, one of the five-act dramas of Casimir Delavigne, has just been performed at the Porte Saint Martin, by a specially organised company, including Dumaine and Taillade, Mdlle. Patry and Mdlle. Angèle Moreau. Dumaine plays Charles the Fifth, but as a jolly fellow and not as a weary monarch; and the reading, though novel, is disapproved of. The piece belonged to the repertory of the Théâtre Français; but the right to perform it—along with that of other plays by Casimir Delavigne—has recently changed hands; and the directors of the Porte Saint Martin are under an engagement to produce one of these pieces every year for the next three years. *Don Juan d'Autriche* will be succeeded next year either by *Les Enfants d'Edouard* or by *Louis Onze*. An attempt to bring M. Geffroy to the Porte Saint Martin, for the part of Louis the Eleventh, was unsuccessful.

ABOUT three thousand pounds are to be invested for the benefit of old Mdlle. Déjazet, as the result of the performance lately given on her behalf at the Salle Ventadour—an amount that may be compared with that realised in compliment to Mr. Benjamin Webster last spring in London, with the notable difference that Mr. Webster's money was all raised by the legitimate attractions of a unique performance and that much of Mdlle. Déjazet's is due to the very pressing appeals which favourites of the moment, who were hardly artists, thought fit to make to admiring princes and benevolent bankers. An example was thus set which it is to be hoped may not be followed.

THE performance of *Zaire* at the Théâtre Français has been stopped, owing to the illness of Mdlle. Sarah Bernhardt, who has long been somewhat overworked.

A LITTLE theatre at Berlin is preparing a burlesque called *Schiller und Goethe*. The poets' lives and characters are to be caricatured, it seems.

AN interesting article in the Russian paper *Golos* gives the following details respecting the Theatre in Russia:—In St. Petersburg the four

Imperial theatres no longer suffice for a population of more than 725,000 people, although they are large and splendid buildings. The so-called Large Theatre serves for the representation of a magnificent ballet and the Italian Opera, which, thanks to the clever impresario, was one of the best in the world. Notwithstanding the high prices all the best places were always engaged for the Italian Opera, and scarcely one-fourth of the applications for seats could be attended to. The Marie-Theatre, which is situated over against the Large Theatre, serves for the Russian Opera and the Russian Drama; for the latter, also, the Alexandra Theatre is used. In the Russian capital, as may be imagined, the Russian representations are the most numerous attended, and in these theatres also, when original Russian operas by Glinka, Seroff, &c., or Russian historical pieces are produced, it is difficult to obtain places. The populace, who are specially fond of national pieces, can only enjoy them from the upper galleries, where they have to take the risk of the great crush and the suffocating heat. The Michael Theatre, which was enlarged a few years ago, is dedicated to French and German representations. The Imperial French company is the best and most numerous in the world, and its repertoire comprises that of the Théâtre Français to that of the Théâtre du Palais Royal. Here, by the side of the old classical works, the *Belle Hélène* and the modern *Ehebruchs-dramen* are offered, which matrons do not attend in company with their daughters. The German troupe is also a good one; it is, however, but seldom visited by the Russians, but is almost exclusively patronised by the numerous Germans who are settled in St. Petersburg. During the summer all the theatres are closed, and in the interval the Russian artistes for the most part resort to the Imperial summer theatres of Kameny-Ostrow, Krasnoe-Selo, Peterhof, &c. Besides the Imperial theatres there are two private theatres, viz., the Théâtre-Bouffe, close to the Alexandra Theatre, for scenes or incomplete French operettas, such as those by Offenbach; and the Berg Theatre, a sort of *café-chantant*, where respectable ladies do not willingly show themselves. The *Golos* calls attention to the fact that in St. Petersburg, as well also in Moscow, a National Theatre such as is desired by the people, where they can enjoy the performances from better places than the upper galleries, is sadly wanted.

MUSIC.

LIVERPOOL MUSICAL FESTIVAL.

(Concluding Report.)

Thursday, October 1.

A VERY few lines must suffice to record last night's concert, which, like that of Tuesday evening, was of a miscellaneous character. The most important novelty of the evening was Gounod's music to *Joan of Arc*. This work was first produced in this country at St. James's Hall last February, under the direction of the composer. It was noticed at that time in these columns in some detail (see ACADEMY, Feb. 14); and further acquaintance with the music gives no cause to alter the opinions then expressed. Gounod's delightful "Funeral March of a Marionette" was also given, for the first time in Liverpool. Excellently played as it was, by the audience it was evidently thoroughly enjoyed. Another novelty was "The Hymn of Eros," an unaccompanied chorus, with solo parts, by the Earl of Wilton—a very tame and colourless production, quite unworthy of a place in the programme. The execution by the chorus left much to desire; at one point, in fact, a total collapse was imminent. The solo parts were in the hands of the London Glee and Madrigal Union, and, it is almost superfluous to add, could not have been better sung. Mr. Sims Reeves had sufficiently recovered from his cold to be able to appear, and sang Benedict's "It is a charming girl I love," and Blumenthal's "Requital"—with what effect need not be said.

The other vocalists of the evening were Madame Patti, Mr. E. Lloyd, Herr Behrens, and (in the *Joan of Arc*) Miss Galloway. Beethoven's "Pastoral" symphony and the overture to *William Tell*, both admirably played, opened respectively the first and second parts of the concert.

The length to which this letter has already extended will necessitate a much briefer notice than its merits warrant of the performance this morning of Sullivan's *Light of the World*. Written for the Birmingham Musical Festival of last year, it has since been revised and curtailed by its composer, to its very decided advantage. It was performed at the Royal Albert Hall on the occasion of the state visit of the Duke and Duchess of Edinburgh; but the performance was so unsatisfactory that a just estimate of the work was hardly possible under such conditions. This morning the oratorio has been heard to far greater advantage; a finer rendering could hardly be wished for. Though naturally showing slight traces of the effect of the week's hard work, the chorus sang admirably throughout, while a better troupe of soloists than Miss Edith Wynne, Mdlle. Patey, Mr. Sims Reeves, Mr. Lloyd, and Mr. Santley could not be imagined. *The Light of the World* contains much most excellent music, and many movements of which Mr. Sullivan may well be proud; but on the other hand it is not without serious blemishes. Foremost among these is the almost uniformly serious tone of the music, especially in the second part of the work. This arises from two causes—first and foremost, from the libretto, which is deficient in contrast of situations; and then from the peculiar treatment by the composer of the part of our Lord. This is accompanied throughout by one sombre orchestral colouring, which, interesting at first, becomes after a time monotonous. Mr. Sullivan will of course plead the authority of Bach for thus individualising the character of the Saviour; but there is the important difference that Bach gives the accompaniment to the strings, which one can hear for almost any length of time without fatigue, while Mr. Sullivan has employed chiefly the graver wood instruments, the tone of which soon palls on the ear. To turn now to the pleasanter task of specifying some of the many excellencies of the work. The choral writing is throughout admirable. Especially fine are the choruses "In Rama there was a voice heard," "I will pour my spirit," "Hosanna to the Son of David," and the finale, "Him hath God exalted." In the solo music the beautiful accompanied quartett "Yea, though I walk," is perhaps the gem of the work. It was exquisitely sung by Miss Wynne, Mdlle. Patey, and Messrs. Lloyd and Bridson, and enlivened with an enthusiasm that there was no resisting. The songs "Refrain thy voice from weeping" (Mr. Sims Reeves), "Tell ye the daughter of Zion" (Miss Wynne), and "God shall wipe away all tears" (Mdlle. Patey), may also be named as among the most successful numbers of the work. In his treatment of the orchestra the hand of a master of instrumentation is seen throughout. Mr. Sullivan conducted his own work, and received an ovation both on entering the orchestra and at the conclusion of the oratorio.

This evening the Festival will be brought to a close by a miscellaneous concert; and to-morrow there will be a series of competitions (similar to the National Music Meetings at the Crystal Palace) in St. George's Hall.

Thursday Night.

THIS evening's concert, which has concluded the Festival, has brought forward the last of the novelties promised, in the orchestral piece entitled *The Lay of the Last Minstrel*, by Mr. J. F. Barnett. It is impossible now to speak in detail about this composition; probably another and more suitable opportunity will occur for noticing it more fully. Suffice it here to say, that it is throughout full of melody, and ingeniously and effectively scored. That it shows

traces of the Mendelssohn influence will be anticipated by those who are familiar with its composer's other works. Its reception by the audience was most enthusiastic; the third movement, a piquant scherzo, entitled "The Elfin Page," was encored; and at the close of the work Mr. Barnett, who himself conducted the performance, was recalled to the platform and most loudly applauded. That the work suits the public taste is very evident.

Passing over the details of the rest of the concert, merely saying that it included, among other things, Mendelssohn's "Italian" symphony, there are a few words which ought to be said in conclusion. First, that it is a cause for infinite regret that Mdme. Patti, with her splendid talents, should sing such pieces as she has selected for this festival, which serve to show the compass and flexibility of her voice, but from a musical point of view are of no earthly value, and do nothing to raise or educate the public taste; and secondly, that Sir Julius Benedict, who has been persistently, and I consider most unwarrantably, attacked in some of the local journals, deserves the highest possible recognition of his services. His reading of all the various music which he had to conduct was unimpeachable; and to his energetic exertions no small part of the success, from a musical point of view, of the festival is due. A special word of praise is also certainly due to Mr. James Sander, the chorus-master, whose energy and care in training the Liverpool singers have throughout the festival produced such admirable results. How far it will be a success financially is as yet unknown, though the half-empty benches at some of the concerts looked ominous.

EBENEZER PROUT.

In France so few reputations live to enjoy a green old age, that we may quote for its good nature a *mot* which passed on the occasion of Mdme. Déjazet's benefit at the opera. Some one who had forgotten that she had made her *début* in 1803, at the age of five, asked, "Quelle âge a-t-elle donc au juste?" "Elle aura bientôt vingt ans . . . pour la quatrième fois," was the reply.

THE winter programme of the Stern'sche Gesangverein in Berlin, conducted by Herr Julius Stockhausen, has been issued. The chief works to be performed are *Elijah*, the *Messiah*, Brahms's "Triumphlied," the third part of Schumann's *Faust*, and Bach's *Matthäus-Passion*.

M. LAMOREUX's oratorio performances in Paris will begin early in November, at the Circus in the Champs-Élysées. The works to be given are Handel's *Messiah*, *Israel*, and *Judas Maccabæus*, and Bach's "Passion according to Matthew."

LAST winter the Società del Quartetto in Milan offered prizes for the composition of a string quartett. It is now announced that the first prize has been awarded to Herr Gustav Brah-Müller of Berlin, and the second to Signor Benedetto Maglione of Naples. There were seventeen competitors.

A NEW symphony by Herr Carl Reinecke is to be produced at one of the earlier of the coming Gewandhaus concerts at Leipzig.

JOACHIM RAFF has also completed a new symphony (his sixth) in D minor, which will shortly be published by Messrs. Bote and Bock, in Berlin. The same composer has written a violoncello concerto for the celebrated *virtuoso* Friedrich Grütz-macher.

It is reported from Vienna that the widow of the composer Mercadante is living there, in very reduced circumstances.

THE publication of the complete edition of Mendelssohn's works by Messrs. Breitkopf and Härtel, announced in these columns a few weeks since, seems likely to meet with serious delay. Herr Kistner, the well-known Leipzig publisher,

has issued a notice that he will not allow those works which are his copyright—including, among others, the *Antigone*, the *Walpurgis Night*, the 95th and 98th Psalms, the *Ruy Blas* overture, and the sonatas for piano and violoncello—to be included in the edition; and Herr Simrock, of Berlin, has pursued the same course with respect to *St. Paul* and *Elijah*. It thus appears that the new edition cannot even approach completion till the expiration of the copyrights in 1878.

THE German Handel Society has just issued the fourteenth annual instalment of its splendid edition of Handel's works. Five operas are given this year, three of which have not been previously published, while the other two were only obtainable in Arnold's very incorrect edition. The works in question are—*Agrippina*, *Rinaldo*, *Teseo*, *Amadigi*, and *Muzio Scevola*.

THE news of the erection of a new Academy for Music at Wiesbaden, in our last week's issue, which we reprinted from the *Kölnische Zeitung*, with the remark that we had not much confidence in its truth, has now been acknowledged by that paper to be erroneous.

SIGNOR GOMEZ, the composer of *I Guarany* (recently performed at Covent Garden), has been very successful with his new opera of *Salvator Rosa*, which was lately produced at the Scala, in Milan. The music is said to be superior to his earlier composition, and the libretto interesting.

THOSE of our readers who feel an interest in the personal appearance of great musicians will be glad to have their attention directed to two excellent photographic groups issued by the firm of F. Bruckmann in Munich and Berlin, entitled respectively "Ruhmeshalle der Deutschen Musik," and "Ruhmeshalle der Ausserdeutschen Musik." The first contains above eighty portraits of the chief German musicians, from Bach and Handel down to Liszt and Wagner, and includes not only all the great composers, but also the most eminent performers, both vocal and instrumental. In the companion picture are nearly ninety portraits of the most illustrious non-German musicians, the French and Italians being of course in a large majority. The portraits are in all cases reproductions of the best attainable likenesses; the grouping is most artistic, and the photography of the highest finish. The pictures are published in three different sizes, the largest being about 32 inches by 28, and the smallest about 12 inches by 8.

In the neighbourhood of Eisenstadt there still exists a little summer-house which was formerly the property of Joseph Haydn. It is overgrown with ivy, and overshadowed by fruit trees. The little wooden house with the garden belonging to it is now the property of a shoemaker. Its furniture in Haydn's time consisted only of a small piano, a writing-table, a rush-bottomed couch, and two similar chairs. The walls were without decoration, and were pasted over with sketches of music in score, rough drafts of songs, three and four-part canons, &c. In this little summer-house Haydn created a great part of his immortal works.

In Dresden, at the Hoftheater, Mozart's "Sera-glio" was revived a week or two ago, after an interval of several years. The Dresden papers say it was a very great success.

It has now been finally decided that Gluck's *Iphigenie in Aulis* will be revived this season at the Vienna Opera House. The rehearsals were to have begun this week.

JOHANNES BRAHMS, who has for the last two years conducted all the concerts at the Gesellschaft der Musikfreunde, in Vienna, will take this office also during the next season. It is not yet decided whether or no he will compose a Symphony for the Crystal Palace, or an Oratorio for the next Birmingham Festival.

POSTSCRIPT.

THE Directors of the Alexandra Palace Company have decided to open the new Palace with a grand musical performance on Saturday, May 1, 1875. The building is now rapidly advancing, and the decorations of the interior are nearly complete.

MR. THORNBURY will deliver a lecture at the Working Men's College, Great Ormond Street, to-day, on "The Legends and Traditions of Holborn."

ON the occasion of Michael Angelo's birthday (March 6) a new book, under the name of *Vita di Michelangelo narrato con l'ajuto di nuovi documenti*, by Aurelio Gotti, the Director of the Royal Gallery in Florence, will be published. A number of documents which have hitherto been in possession of the Buonorotti family, have been placed at Director Gotti's disposal. These documents include 700 autograph letters from Michael Angelo, 1,400 letters from his friends, amongst whom we find the greatest artists of his time. All the contracts for the great master's works, and many notes from his own hand are also embraced in this collection.

NEARLY a hundred thousand marks have been collected in different parts of the world for the monument which is to be erected to Liebig at Munich.

THE Royal Imperial Horticultural Society of Vienna has initiated a movement for the erection of a memorial in honour of the renowned horticulturist Siebold, and has addressed an inquiry to the town of Würzburg (Siebold's native place) as to whether the town will join in the undertaking, and whether it can offer a good site for the monument. An answer has been returned to the effect that both the magistrates and the parochial authorities have declared their approval of the proposed erection of a Siebold monument in Würzburg, and that the town authorities will lend the project their support. A most advantageous spot has been designated for the site of the memorial.

No. 128, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

LITERATURE.

MANCHESTER GRAMMAR SCHOOL.

The Admission Register of the Manchester School, with some Notices of the more Distinguished Scholars, 1730-1837. Edited by the Rev. Jeremiah Finch Smith, M.A. Printed for the Chetham Society, 1866-1874. 4to. In Three Volumes, in Four Parts.

THE Manchester Free Grammar School owes its existence to the wise liberality of Hugh Oldham, Bishop of Exeter, who having a good will towards his native country, and seeing that "the brryning upp in lernyng, virtue, and good manners, childeryn in the same countrey, should be the key and ground to have good people ther," built and endowed a school, which received further gifts from other persons who were anxious that the Lancashire lads, "havyng pregnant witte," should no longer be "brought up rudely and idilly," but "in vertue, connyng, erudition, littature, and in good maners." Since its origin in 1515, the school has continued its educational work with varying, but generally conspicuous, success, and can point to a long roll of distinguished alumni. The school endowed for a thriving village has done good service to the overgrown metropolis of the Cotton district, and we may reasonably hope will yearly increase in importance, thanks to the liberality which has enabled it of late years to build a new home, and greatly to extend its educational course. From one worthy Nonconformist alone it has received 20,000*l.* and their veneration for the "dead hand" of the benefactor has not prevented the Lancashire Conservatives from aiding in some very radical changes in its constitution. Without dwelling upon these or the struggles, legal and literary, by which they were preceded, we may hope that in the future, as in the past, the Manchester School may send forth its students well equipped for the battle of life, and if in the next three centuries it can produce one equal to Bradford, the martyr, for piety; Humphrey Chetham, the founder, for liberality; and Thomas de Quincey, for literary skill, it will have been more fortunate than many similar institutions. Two of the three had let the founder's family motto, "Dare to be Wise," sink into their hearts, and the sensitive nature of the third would have been happier had he always ventured to abide by it. A list of the scholars from the commencement would be a valuable document for the Lancashire antiquary, but unfortunately the materials for it do not exist. The registers still preserved commenced with the year 1730. The name of the new scholar, together with the name and description of his father, were generally entered in the register book by the head boy, who was not always very careful, and sometimes forgot to enter names. Among those left out we have

Samuel Bamford, "the Radical," whose strong and independent spirit led him to take an active part in the Reform agitation, and who was one of those tried for being at the famous meeting held on Peterloo to petition for redress of grievances, which was dispersed by a company of swashbuckling Cheshire yeomany, who valiantly rode down unoffending citizens and courageously sabred helpless women. For this gallant conduct they fittingly received the thanks of the government of the "First Gentleman in Europe." The first entry relates to Thomas Coppock, a tailor's son, whose talents gained him one of the rich exhibitions connected with the school, and conducted him to Oxford, where he was pursuing his studies, when the ill-starred Young Pretender raised the standard of the Stuarts. Coppock joined the rebel army, read prayers with a sword on his side, and being a general favourite, was appointed Bishop of Carlisle. Like most of those who fell into the power of the government, Coppock suffered the full penalty of the barbarous law of treason. If the House of Stuart was never grateful to a friend, the House of Hanover was never merciful to an enemy. One might well say *absit omen* in reference to this first entry.

The Manchester school has been more successful in producing county gentlemen, schoolmasters and clergymen, than traitors. In 1759 the tragedy of *Cato* was acted at the Theatre by the Grammar School boys. The ten actors were:—Arden, jun., afterwards Baron Alvanley, Lord Chief Justice of the Common Pleas; Heap, afterwards Vice-principal of Brasenose College, Oxford; Travis, who became Archdeacon of Richmond, and Gibbon's most dangerous critic; Arden, sen., who was high sheriff of Cheshire in 1790; Arnald, who was senior wrangler in 1766, D.D., and one of the teachers of George IV.; G. Bower, afterwards Archdeacon of Richmond; and F. Bower, who became Recorder of Chester. Of the remaining three, one was either Joseph Edwards, M.A., of Brasenose, or Joseph Edwards, B.A., of Hertford College. There are few school playbills which can show so large a number of performers who have afterwards acted well their part upon the larger stage of human life, where friends are not always ready to cheer and to sustain. Among those of whom some notice will be found in Mr. Smith's volumes, are: Sir Joseph Yates ("that great lawyer, that honest man," as Junius styled him); the Rev. John Watson, the well-known Yorkshire antiquary; Reginald Heber, the father of the Bishop; Dr. Thomas Percival, whose claims as an elegant writer and moralist are not sufficiently appreciated in our own day; John, Lord Crewe; Joah Bates, of musical fame; Cyril Jackson, the "great" dean, who declined a bishopric; and his brother William, who accepted one; Sir Thomas Egerton, the first Lord Grey de Wilton; Colonel Stanley, one of the early race of bibliomaniacs, who participated in the Roxburgh revels, and whose choice library, including many rare Italian and Spanish books, brought what was then thought an enormous price; Bishop Porter, who "is said to have left property to the amount of 240,000*l.*, reaped by the sale of some beneficial leases appertaining

to the see;" Dr. Thomas Winstanley, who was a pluralist both in the Church and university, holding two professorships and two parishes; General Seddon, whose military talents gained him distinction in India, Russia, Egypt, and Ireland; John Drinkwater, whose account of the siege of Gibraltar will long remain an English classic; John Haddon Hindley, who turned to good account some of the little-known Oriental MSS. of the Chetham Library; Dr. James Haworth, who resided in Red Lion Square, where he had an invisible wife; (Thyer, another Grammar School boy, took in holy matrimony a lady named Silence); Sir R. H. Leigh, a good classical scholar and a staunch Tory, who "rebuilt Hindley Hall from his own designs, and forgot to include a staircase;" Captain Pickford, a dashing sailor, son of Sir Joseph Pickford Radcliffe; Bishop Allen, who, although nearly destitute of literary ambition, wrote a pamphlet which led to an increased episcopal income of 1,500*l.* a year; William Ford, the learned bookseller, whose catalogues are full of black-letter rarities, marked at prices so moderate as to drive the bibliomaniac of the present day to envy and despair; Dr. Thomas Falconer, of classical fame; Sir John Williams, one of the advocates for Queen Caroline in the famous trial; Archdeacon Glover, a clever, ambitious churchman, who wrote some good verses on Chantrey's famous woodcocks at Holkham—"Though fall'n by Chantrey's hand, we yet survive; His gun may kill, his chisel makes alive;"

General Everard, who led the forlorn hope at Monte Video; Bishop Gilbert; Professor Felix Seddon; Henry Halliwell, known at Oxford as Dr. Toe, who left behind him a *fine cellar of wine* and a good library; and a host of others, whose names would form a list as long, if not so euphonious, as Homer's catalogue of the Grecian ships. There is one name that it would be unpardonable to pass by in silence. Many of the Manchester boys have achieved greater wealth and higher social position, many of them, it may be, made better use of the talents they had, but on none of those students who during three centuries passed beneath the blinking gaze of the stone owl had heaven showered greater gifts than on Thomas De Quincey. The delicate spiritual insight, the keen judgment, the power of analysis, the perfect mastery of the eloquence of words, all these proclaim him a man of the highest talent removed by one degree only, and that a slight one, from genius, which never fails.

"Talk not of Genius baffled: Genius is master of man; Genius does what it *must*, whilst Talent does what it can."

If the poet is right, and we think he is, we cannot claim for De Quincey the possession of genius in this high sense of the word, for there is an incompleteness alike in his life and in the brilliant but fragmentary essays which form his literary memorial.

Many illustrations of bygone social conditions, and many quaint anecdotes relieve the aridity of the mere catalogue of the unknown names. A number of queer stories are told of the Rev. Joshua Brookes, whose eccentricities are among the traditional Joe Millers of Manchester. There is one told respecting a child brought to him to be baptized,

upon whom the godparents wished to confer the Stuart appellation of Charles Edward. "Charles Edward," exclaimed the irritable chaplain, "I'll have none of your Jacobite names here. George! I baptize thee," &c.

Mr. Charles Lawson, the most prominent of the past High Masters, was a second Bushy, and is said on one occasion to have flogged all the school—before breakfast. Thomas Adnutt had exceeded his holiday by a few days. Mr. Lawson enquired: "Blockhead, why did he not come to the time?" The answer was, "My father died." "Blockhead, he could not help that; don't do so again, blockhead." At the end of another vacation this pupil lost another near relative, and was again behind time. Lawson's comment was: "Blockhead, he is always having fathers or something die;" and actually inflicted a punishment upon this monopoliser of grief and sorrow.

There is a good anecdote of Fourness, a sporting parson of a type (let us hope) happily extinct. A Quaker said to him:—

"'Were I a hare, thee sho'dst never find me.'"

"'Ah, neighbour Broadbrim, where is it? I know every place from the Winn cover to the sand pit.'"

"'I would hide in thy study, friend Tallyho! and lie in form beside thy big Bible.'"

At the meeting of the old scholars in 1843, thirty-five gentlemen met and drank thirty-five toasts. As a warning to pedigree makers we may name a clergyman who claimed lineal descent from Bishop Alcock, a prelate so greatly opposed to the marriage of the clergy, that he wrote, when Lord Chancellor, "his learned work on the Spousage of a Virgin to Christ."

The story of Richard Sparling Berry's life is not untinged by romantic interest. The inheritor of a large fortune, he saw and admired a lady at Oxford, to whom he failed to gain an introduction. Her charms made a deep impression upon his mind, which her subsequent marriage failed to efface, and he left a will by which she was named his heiress. Although he had kept terms, he failed to execute the will with the necessary formalities, and the result was that the greater part of his property passed to the heir-at-law, whom he had always declared should not inherit it. By another informality some charitable bequests were rendered partially void. In life and death equally unsuccessful, even his wish to be buried in a sarcophagus which he had placed on the top of Hawkshead Hill, in his own grounds at Bolton-le-Sands, was disregarded by his executors.

To the notice of Bellot, the surgeon (vol. iii. p. 117), should be added that he was a friend of Bopp's, and one of the first to turn the attention of English philologists to Sanskrit. His little book on the derivation of English words from the ancient tongue is now a rare work. His Chinese bronzes and books were bequeathed to the Manchester Free Library (a life interest in them being reserved to his brother), and the portion of them now in that institution were described in *Trübner's Record* for July, 1870. It would be an easy task to extend the list of those who have been connected with Manchester School, and who in after life as clergymen, *littérateurs*, statesmen, lawyers, and merchants, did good ser-

vice to the community, and to gossip about those who had the moulding of these youthful minds. One omission pointed out, and we have done. The name of Charles Henry Timperley is not found in these volumes, although we have his own testimony to the fact that he was a student there. Soldier, printer, author, and poet, he had an eventful life, and received some hard buffetings from fortune. As we have often been under a debt of gratitude to him for the valuable mass of literary fact and anecdote which he has brought together in his *Dictionary of Printers*, we are glad to learn from a recent writer in the *Reliquary*, for April of this year (our genial friend, the "Sherwood Forester"), that his latter days were not wanting in the ease and comfort which was certainly due to the independent spirit and industrious brain of Charles Henry Timperley.

The editing of this work has fallen into the hands of the son of one of the former High Masters of the School. Dr. Smith preserved many interesting memorials of his pupils; and his son, the editor, has not hesitated to incur the responsibility of the extensive correspondence necessary to procure information about the hundreds whose names have received biographical annotation. That many still remain without elucidation is inevitable. It is not given to every one to achieve either distinction or notoriety, and it may be that among those who are thus passed over silently are many who as sober citizens were not unworthy of, although they failed to gain, or perhaps did not seek, public fame. The book has been most carefully and conscientiously compiled, and the writer's bias in religion and politics is only so far prominent as to add a grain of Attic salt to some of the notices. The variety of biographical interest contained in these volumes is very great. In reading them we seem to be at a meeting of old scholars, listening to the chat of the greybeards about those who were their schoolmates in the days when Plancus was consul. How one had died in a bishop's palace, and another in the workhouse. How Elijah the shoemaker's son had become distinguished alike for learning and piety, while Joseph the dyer's son had sunk into a drunkard's grave, and of all the other changeable fortunes which had come to the merry boys who had studied and played together, unmindful of the varying gifts which the fateful Future had in store.

WILLIAM E. A. AXON.

A Concordance to Shakespeare's Poems: An Index to every Word therein contained.
By Mrs. Horace Howard Furness. (Philadelphia: J. B. Lippincott & Co., 1874.)

It is not likely that there will soon be an end of Shaksperian controversies. For more than a century war has raged over the remains of the great dramatist, and the *odium Shaksperianum* has scarcely been surpassed by that which characterises rival theologians. There have arisen from time to time noisy sciolists, who have settled everything to their own satisfaction with an overbearing dogmatism varying inversely with their fitness for the work; and a glance at the criticism of our own day suffices to

show that this breed is not extinct, or on the verge of extinction. Literary quackery has in fact displayed itself with peculiar brilliancy in connexion with Shakspeare. The mountebank has come forward with his nostrum, and audacious and blatant after the manner of his kind, professed to cure every disorder; and for an hour or so foolish people have listened. But presently this gentleman and his goods have disappeared, and some new doctor has taken his place and bawled out the virtues of some fresh panacea. The Commentators have become proverbial, not for wisdom. Not that there have not been amongst them men of infinite merit, and men who have done for their special study imperishable service; but it is certain that as a class they are not considered models of sagacity. Too often they have resigned their judgment to some queer fancy, or superstition, or fatally narrow creed. They have insisted that Shakspeare was all this, and all that, and not seen that he was both this and that. They have attempted to arrange all difficulties by some single test that can only, at the best, serve as the humbly of better methods. A strange motley group they form, if one pictures them all together on one field. In the midst there stands the colossal figure of the great poet, his head rising out of sight into the clouds. Around his feet his interpreters disport themselves like so many preternaturally grave boys—young heads on old shoulders. One of exceptional vigour has managed to climb up as far as the knee of the statue, which he is convinced is its shoulder, and this conviction he is proclaiming with wild gesticulations to an enthusiastic mob below. Others are amazingly busy with its clothes and the general costume. To hear them on Shakspeare's boots, you would think those integuments were of more moment than the feet inside them; and that anything might possibly be said of his cap, or the head it covered, would seem a quite irrelevant notion. Then the volumes on his doublet and hose! Ah! what a theme! Whose heart would not leap up at it? But it is too vast for one mind to comprehend. So men tell themselves off for special investigations. Who does not know the great authority on Shakspeare's buttons? Then his "points"—what a marvellous work that is on that thrilling theme! And his gloves—how that luminous treatise on his gloves astonished everybody with its learning, acumen, imagination! For many people it is not too much to say that the chapter on the thumb of the right hand made an epoch in their lives. Meanwhile, as we have said, the clouds enfold the upper part of this huge form. It may be noticed that the greater part of the multitude below have been conveyed to the spot on hobby-horses of the stoutest build.

There are happily other critics of a far different race. These stand afar off, and yet see more. They shrink from the dictatorial ignorance of that remarkable crowd, as also from the fatuous misdirection of its idolatry. They are content to study, not to dogmatise. They are thoroughly conscious of the immensity of the subject, and would as soon be guilty of the arrogance of finally estimating it by their own puny standards as of measuring the heavens with a two-foot rule.

These latter critics will rejoice in the invaluable contribution to Shaksperian study that has just reached us from the United States. And for those others, with their crude theories and ever-ready dogmatisms, let them bethink themselves, if that is possible, for no more fatal enemy to their race has ever yet appeared.

The *Concordance to Shakespeare's Poems* is a worthy companion to *The Complete Concordance to Shakspeare, being a Verbal Index to all the Passages in the Dramatic Works of the Poet*. It too is the work of a lady, the wife of one whose *Variorum Shakspeare* is making him everywhere known and distinguished. We do not think we exaggerate when we say that no two more effective and inestimable helps to real Shaksperian criticism exist than the volumes for which we are so deeply indebted to Mrs. Cowden Clarke and Mrs. Horace Howard Furness. We welcome the newly arrived one with the utmost heartiness. It is like the coming of a fresh breeze that will never cease to blow, to blow away the foolish phantasies that are perpetually issuing from the brains of ill-informed guess-mongers, to blow strength and vigour into all criticisms that are genuine births of knowledge and judgment, and of a sound and healthful nature.

We are bound to notice specially that it is to two women that we owe these treasures of classified fact. The ordinary conception of "the sex" may justly be disturbed by this phenomenon. The masculine exploit of Cruden has been equalled by feminine industry. Why may not a lady Liddell-and-Scott, or a Johnsoness, be looked for in the process of the ages? "The perfecter sex," as Milton is pleased to call the male kind, may well look to itself; or, more wisely, rejoice that fresh workers have come into the field. For new lines of Shaksperian study are perpetually opening, and fresh help is perpetually wanted for the exploration of them.

"Well may we labour still to dress
This garden, still to tend plant, herb, and flower,
Our pleasant task enjoined; but, till more hands
Aid us, the work under our labour grows."

Mrs. Furness has executed her task with unsparing diligence. She has recorded every word that occurs in the Poems. Even a has been tabulated. In this respect her work is more complete than that of her predecessor, though, as she remarks with kindly considerateness, no "imperfection is hereby imputed to Mrs. Clarke's invaluable Concordance of the Dramas. The bulk of that work was a sufficient bar to the plan I have been enabled to follow in the lesser task before me." In another matter the new Concordance is the exacter: Mrs. Furness gives the number of the line in which each word occurs. Those who have spent precious minutes in hunting through long scenes in the plays, will be grateful for this definiteness. Of course it can scarcely be hoped that the references are absolutely accurate. "As the pages are stereotyped," says Mrs. Furness, "corrections can be made at any time of misprints, against which it seems no human vigilance can guard, and I shall be grateful to the kindness that will notify me of them." A quite faultlessly printed book is said never yet to have been

issued from any press. *Humanum est errare*. Errata will happen. So much must be allowed; but we must say that, so far as our own use of the volume is concerned, and it has already been considerable, we have detected no flaw in the figures.

It is just possible a word or two may have been accidentally omitted; but in this respect, too, the work, so far as we have tested it, seems to us a wonder of completeness. We will venture to extend Mrs. Furness' appeal, and hope that any of our readers who find any fault whatever in this minute directory will favour her with the information.

By the "Poems" are to be understood all the non-dramatic works that are usually connected with Shakspeare's name. Mrs. Furness follows the text of the Cambridge edition, from which "with the exception of some trifling deviations in punctuation, she reprints the poems at the end of her volume, for the sake of convenient reference. And in so using the title "Poems" in this sense, she has acted wisely, though by so doing she includes several pieces that are almost certainly not by Shakspeare. It was not her business in this cataloguing to settle or to entertain questions of authenticity. It would be as unwarrantable to complain of her having admitted into her index "Live with me and be my love," as to accuse Mrs. Cowden Clarke of negligence for having excluded *The Two Noble Kinsmen*.

J. W. HALES.

William Carstares. By Robert Herbert Story, Minister of Roseneath. (London: Macmillan & Co., 1874.)

CARSTARES is one of the minor characters of history to whose life circumstances gave sufficient prominence to make it worthy of record. He was the second founder of the Scotch Presbyterian Establishment, which has in the last and present century been guided by his spirit of moderation more than by the uncompromising and intolerant zeal of Knox. It is significant that his biographer is one of the ablest among the younger ministers of that Church, while the life of Knox was written by Dr. M'Crie, the most learned historian Scotch dissent has produced. The short memoir prefixed by M'Cormick to his collection of Carstares' State Papers was inadequate, and in some points inaccurate, and it is fortunate that Mr. Story has undertaken a task for which he is qualified by his knowledge of Scotch history as well as by sympathy with the position Carstares occupied in church politics and in doctrine. He has also had the advantage of access to family papers which, without throwing much new light on general history, help to complete our knowledge of Carstares. "Honest William Carstares" was the brief but royal answer with which William of Orange met the detractions of his own countrymen and the jealousy of the English bishops. Without a single brilliant quality, he shows how much may be accomplished by sound judgment, perseverance and integrity. Born in 1649, the son of John Carstares, minister of the High Church of Glasgow, his childhood and youth were passed during the period when

Scotland was ruled severely but wisely by Cromwell, and with an arbitrary mixture of severity and indulgence by Charles II. and his ministers. The Scotch were divided into religious parties, whose controversies had always a political bearing, and were conducted with intense bitterness and blind zeal. Carstares' father was of the narrowest sect, preached against the times during the Commonwealth, and protested against the rescission of the Act of Classes, by which persons who had entered into the Engagement with Charles I. at Carisbrooke were excluded from public employment. Mr. Story condemns unsparingly this party, and praises their opponents the Resolutions—of whom the garrulous Baillie, the Burnet of the Scotch Church, was the head—as the "wise men of the *via media*." In this judgment it is impossible to concur, for this was the party which recalled Charles II. under the bonds of the Covenant, an act they knew to be dishonest and bitterly repented. Undoubtedly, however, the extremes of his father's friends produced a reaction in young Carstares, and contributed to make him a constitutional moderate instead of a party zealot. But to become the adherent of William and the supporter of toleration, a different training was necessary than that which any party in the Scotch Church could supply. This was afforded by his education in Holland, where he went in 1667 to the University of Utrecht, after completing his course in arts in Edinburgh. In Holland, where there existed an important branch of the Scotch Church, he was ordained, and there he became through Fagel acquainted with William, already on the lookout for the ablest instruments to further his designs in Britain. It was probably with the knowledge of William that he went in 1672 to London; and, in a letter to his sister in 1674, we find the natural discontent of an exile was alleviated by the hope of better days for his country and himself. "It may be at last in providence I may have some door opened whereby I may be in a capacity to do some little service in my generation, and not always be insignificant in my station." His ambition was cut short by his arrest in London and examination before Lauderdale on no definite charge, probably on the suspicion that he had a share in disseminating a pamphlet entitled *An Account of Scotland's Grievances by reason of the D. of Lauderdale's Ministrie*. Though nothing was proved he was sent to Scotland, and kept prisoner in Edinburgh Castle without trial for five years. Liberated in 1679, when Monmouth was trying to conciliate the Scotch by clemency, he seems to have lived chiefly in England, where he married a Cornish lady, Miss Kekewich, but returned to Utrecht in 1683. He there became an active agent in the measures which led to Argyle's unsuccessful expedition. When in England, towards the close of this year, he was a second time arrested and sent to Scotland, with the view of bringing him under a severer criminal law. The story of his torture by the Privy Council, and the use of his deposition, contrary to a solemn promise, at the trial of Baillie of Jerviswoode, are well known. He was himself released in 1685. After a journey in the Rhine pro-

vinces, of which Mr. Story gives an interesting diary, he again settled in Holland, where he was appointed minister of the Scotch Church at Leyden, and chaplain of William, who confided in him more than in any other British exile. He came in the same ship with the Prince to Torbay, and was never long absent from him. He had apartments at Court, and accompanied the King as chaplain in his campaigns. From this time, indeed, to William's death he was virtual Prime Minister for Scotland, so that the Jacobites nicknamed him the Cardinal; but he bore his elevation meekly, and used his influence wisely. His advice was taken on almost all Scotch affairs, including the appointment of the ostensible Ministers, and he had the courage to give it even when not asked. The story of his interception of William's despatch, by which the Scotch clergy were required to subscribe the oaths of allegiance and assurance, has been doubted by Grub, but we agree with Mr. Story rests on sufficient evidence. It is quite consistent with Carstares' character and that of his master. The Act for the re-establishment of Presbyterian Church government was revised by William with his aid, and modified so as to give as little offence as possible to the English Episcopalians. There was, however, no abandonment of the position that the Presbyterian was to be the Established Church, and William's instructions to Lord Melville end with the remark: "His Majesty's desire to have what he grants to the Church of Scotland to be lasting and not temporary, makes him incline to have the above-mentioned amendments made upon the Act." The Act abolishing private patronage and vesting the right in the heritors and kirk session, was acceded to by William with reluctance—a reluctance in which, according to M'Cormick, whom Mr. Story follows, Carstares shared. But his strenuous opposition to patronage in the reign of Anne renders this very doubtful. It is much more likely that he induced William to yield his assent to the statute of 1690. Fortunately for his fame, the settlement of the Highlands was one of the few things on which he was not consulted. When Breadalbane's plan for buying off the chiefs was submitted to William, Carstares was with him at his head-quarters at St. Gerard, and he makes the remark in two of his letters that they appear "not so bad as was represented." "This is quite true. Breadalbane's device, which showed a shrewd knowledge of his countrymen, was probably the only possible peaceable issue from a grave difficulty. It was the ruthless policy the Master of Stair prompted, and William sanctioned, by which the slightest deviation from the conditions was to be avenged with blood, that led to the catastrophe of Glencoe. Mr. Story acquits William, and casts the whole blame on Stair; but an anecdote in one of Carstares' letters, now first published, shows how hopeless is the attempt to represent William as personally indifferent to, or ignorant of, the state of the Highlands:—

"I hear the King," he writes to Dunlop, his brother-in-law, on August 17, 1691, "did last night make his company at table merry with his asking at my Lord Breadalbane if there were any wolves in the Highlands, and upon his answering

in the negative, with telling him that they had enough of two-footed wolves to need any four-footed ones!"

During the reign of Anne the influence of Carstares at Court ceased, and it is creditable to his character that he devoted himself with equal vigour to the conduct of the business of the University of Edinburgh, of which he became Principal in 1703, and of the Assemblies of the Church, as he had done to the greater affairs of State. The confidence of his brethren was shown by his being elected thrice to the office of Moderator of the Assembly, an unexampled honour. The interest of the Universities was ever present to Carstares, and his correspondence constantly refers to measures to supplement their scanty revenues, to attract able professors to them, and to increase the number of their students. The large-minded and wise spirit in which he acted is shown by his promise to use his influence to obtain a chair for Calamy; by his suggestion that Glasgow should get professors of theology and philosophy from Holland, for "good men are to be found there;" and his scheme for the education of English Nonconformists under the care of an English warden in the University of Edinburgh. In the history of the Scotch Church during this reign, the principal events were the passing of the Act restoring patronage and the Act of Toleration, and the intolerant attempt to prevent Green-shields, an Episcopal minister, from using the liturgy which indirectly aided the passage of these Acts. On all these points Mr. Story has collected full and interesting particulars; but space allows us only to refer to the first, which has a special interest at the present time. The Act restoring patronage was the work of the Tory Ministry of Bolingbroke and Harley. It was contrary to the feelings of a majority of the Scotch people, and an infringement of the spirit, if not the letter, of the Revolution Settlement and the Act of Union. Carstares was sent as the leading member of a deputation from the Assembly to prevent its passage through Parliament. Mr. Story gives the able petition to the House of Lords drawn by him against it, in which we trace the same arguments which led to its repeal in the last session of Parliament by the Ministry of Mr. Disraeli. But the Government was too strong, and the interest in Scotch affairs too slight, to allow heed to be given to these arguments. The Act was carried in the House of Lords by 51 to 29 votes; and, as Mr. Story observes, has been "the indirect cause of more dispeace and ill-will in the Church than even the Five Articles of Perth, and the pretext of more than one disastrous secession." Whether its repeal has come in time, or in a way to heal these secessions, is a question beyond our present purpose. Carstares survived the succession of George I., and died in December, 1715, in his sixty-seventh year, lamented by all his countrymen, even by the Episcopalians, whom he personally befriended, though not entirely free from the Presbyterian prejudice against their toleration. A zealous Churchman, yet without bigotry; a powerful statesman, yet without arrogance, his character will always be regarded with respect by the student of this

period of Scotch history; and we hope Mr. Story's well-executed Life may increase the number of those acquainted with the particulars of his career. *Æ. J. G. MACKAY.*

GERMAN TRANSLATION OF KRILÖF.

Krylof's sämtliche Fabeln. Aus dem russischen übersetzt, und mit einer Einleitung begleitet von Ferdinand Löwe. (Leipzig: F. A. Brockhaus, 1874.)

THE accomplished translator of the Esthonian Folk-Tales,* Dr. Ferdinand Löwe, has recently published a German metrical version of Krilof's Fables, and he has accomplished his difficult undertaking with remarkable skill and success. Even in prose it is by no means an easy task to render with fidelity Krilof's idiomatic expressions, to follow him closely in his quips and cranks, his sudden bends and doubles. But when the difficulties involved in a rhymed translation are added to those which the original presents, a translator may well be tempted to regard fidelity as at times a secondary consideration. This, however, Dr. Löwe has not done, for his versions are singularly faithful, the original being almost constantly followed line for line by the translation. He has also rendered his work complete by translating the whole of the fables, whereas in the English version those which were directly imitated from La Fontaine have been omitted, and he has prefixed an excellent memoir of the Russian fabulist, and a critical essay upon his fables.

Krilof's Fables have been translated into numerous languages, some of them having appeared even in an Arabic and a Bengali garb. In German two verse translations had already appeared before Dr. Löwe came into the field. One of them, by Ferdinand Torney, was printed at Leipsic in 1842; the other, "treu übersetzt von einer Deutschen," at St. Petersburg in 1863. There are not many Russian writers who have been so favourably received abroad—we may even say there is but one other Russian writer, Ivan Turguenief, who has become really naturalised in Western Europe, though many translations have been made in different countries of various works by Pushkin, Lermontof, Gogol, and some others.

Of the accuracy of Dr. Löwe's translation we have already expressed a decidedly favourable opinion. Of its poetical merits German critics will be the best judges, but in order to give our readers an opportunity of deciding for themselves, we extract the following specimen, chosen, it may be observed, on account of its brevity:—

DIE MUSIKANTEN.

"Ein Nachbar bat den andern einst zum Essen.
Doch war dabei noch List im Spiel.
Der Wirth hielt von Musik gar viel,
Und war darauf vorseh'n,
Dass jener seine Sänger hört;
Jetzt wird ihm dieser Wunsch gewährt.
Die Burschen stimmen an, das geht durch Dick und Dünn,
Aus Leibeskräften schrein die Thoren,
Dem Gaste gellen schon die Ohren,
Es wird ganz schwindlig ihm zu Sinn.

* *Esthnische Märchen.* Aufgezeichnet von Friedrich Krentzwald. Aus dem esthnischen übersetzt von F. Löwe. (Halle, 1869.)

'Erbarm dich doch,' so ruft er voll Verwirrung,
'Woran soll man denn da sich freuen? Dein Chor
Brüllt Unsinn vor!'
'Nun wohl,' versetzt der Wirth mit sanfter Rührung,
'Ein wenig kreischen sie;
Doch dafür trinken sie auch Braantwein nie,
Und alle sind von bester Führung.'
Ich aber sage: trinke wohlgemuth,
Nur mach' auch deine Sache gut."

W. R. S. RALSTON.

Mathurá, a District Memoir. By F. S. Growse, M.A. Bengal Civil Service. Parts I. and II. (North-Western Provinces Government Press: 1874.)

MUCH valuable information and many important contributions to science and literature are to be found in works published in India, more especially those printed by order of Government, and at the Government Presses. Home readers who have not had occasion to look into the matter would be surprised at the mine of archaeological, ethnological, philological, geographical, historical, and general knowledge contained in these comparatively unknown volumes; but which a modest and little attractive exterior and a restricted range of distribution condemn, as a rule, to the thankless destiny of official shelving. It would be well, perhaps, if copies of the better class of India-born reports, held worthy of print and circulation, were sent out for public use and criticism, so that the gold might, at least, have its chance of separation from the tinsel, and be spared a purposeless and ruinous rejection. To examine the present storehouse would be a Herculean task, but by no means unprofitable, supposing only a fractional part of the labour accomplished. It is not simply a question of cataloguing, or even summarising contents. A closer inspection is needed for ascertaining to what society or department any particular information exhumed is valuable, and how it may best be divulged or utilised. On the completion of such a task, it would rest with Government to decide on the action to be taken; unless, indeed, the whole stock were placed unreservedly at the disposal of the public. We are now speaking of literature in its widest and most comprehensive sense; but exclusive of politics. The waste of political data is quite another and not less serious a consideration; equally requiring method and application in the treatment; but in this case the evil to be obviated is more likely to exist in England than in India.

A very good specimen of elaborate report, displaying intelligence and powers of a higher order, is furnished in two separately stitched pamphlets, forming together a volume of 350 closely printed octavo pages, entitled *Mathurá, a District Memoir*. The old Indian will hardly recognise, in this transliterative dress, his vulgar acquaintance "Muttra;" while a glance at the inner pages will disclose the still more startling literal combinations of "Mirath," "Banáras," and "Jamuná." But Mr. Growse is fully justified in a system of no compromise, and can honourably shelter himself against all charges and objections, under the plea of consistency. If the orders of the Government of India on transliteration are to have effect beyond the limits of their official Empire—as

they certainly should have—Cawnpore and Calcutta, together with a few more eccentric appellatives, will soon cease to hold their exclusive privileges of error. For it cannot be supposed that rising generations will admit of exceptions being made, in the programme of progressive reform, whereby the spelling of Oriental names will be debarred the advantages of scientific rectification.

"The modern district of Mathurá," we are told, "is one of the five which together make up the Agra division of the North-West Provinces. It has an area of 1,031,562 acres, and is subdivided into seven parganas, co-extensive with as many tahsils," these being native terms in use for indicating district allotments. The total population according to the census taken in 1871-2, was 892,542, of whom nearly all were Hindús: that is to say, the Muhammadans did not constitute a tenth part of the community, and there were only twenty-three Christians. The language of the people is purely Hindi, and not only are conventional Persian phrases of compliment represented by Hindi equivalents, but the ordinary words used in Urdu for "earth," "water," and like ever-recurring expressions, are in many instances ignored. An instance of reckless dealing with Muhammadan names is given in the statement, that one *Vazir-ul-din* would be called, and would scarcely venture to call himself other than *Waju*. But the familiar abbreviation is not unintelligible; the first letter we think strictly correct, and the third is warranted by precedent and custom. The following extract is interesting and instructive:—

"In the two typical parganas of Kosi and Chhátá there are 172 villages, not one of which bears a name with the familiar termination of *-abad*. Not a score of names altogether betray any admixture of a Muhammadan element, and even these are formed with some Hindi ending, as *-pur*, *-nagar*, or *-garh*; for instance, Akbar-pur, Sher-nagar, and Sher-garh. All the remainder, to anyone but a philological student, denote simply such and such a village, but have no connotation whatever, and are at once set down as utterly barbarous and unmeaning. Yet an application of the rules of the ancient Prákrit grammarian Vararuchi will, in many cases, without any wonderful exercise of ingenuity, suffice to discover the original Sanskrit form and explain its corruption. Thus, Maholi is for Madhupuri; Parsoli for Parasu-rimma-puri (Parsa being the ordinary colloquial abbreviation for Parasurima); Dham-Sinha for Dhama-Sinha; Bâti for Bahula-vati, and Khaira for Khadira. It would seem that the true explanation of these common endings, *-oli*, *-auli*, *-ami*, *-dwar*, has never before been clearly stated. They are merely corruptions of *-puri* or *-pura*, combined with the prior member of the compound, as explained by Vararuchi, in *Sûtra* II. 2, which directs the elision of certain consonants, including the letter *p*, where they are simple and non-initial; the term 'non-initial' being expressly extended to the first letter of the latter member of a compound."

Mr. Growse adds, in a footnote:—

"The practical application of this rule was first suggested to me by observing that the two large tanks at Barsinâ and Gobardhan were called indiscriminately in the neighbourhood, the one Kusam-sarovaz, or Kusumokhur (for Kusum-Puskhara), the other Brih-bhân-Pokhar, or Bhânokhur. As the rule was laid down by Vararuchi 1800 years ago, I can only claim credit for its practical resuscitation; but it is of great importance, and at once affords a clue to the formation of otherwise unintelligible local names."

It is as the birthplace of Krishna that Mathurá, the capital of Braj, has been called the holy city, and has obtained its Indian repute. And, with the city, our author includes the whole western half of the district, in localising the centre of Vaishnava Hindúism. The date of Krishna's birth would, at least, help to determine the antiquity of his native town, the scene, moreover, of his early adventures and exploits; but on this point chroniclers disagree. Some associate him with events occurring a thousand years before the Christian era; others look for him, 600 years later, among the disciples of Sâkya Muni. The *Ayin-i-Akbar* says of Mathurá, that it is on the banks of a river "where are many idolatrous temples, to which the Hindús resort;" but any further mention of the place, in that work, is secondary and incidental. It was pillaged and partly burnt in the early part of the eleventh century by Mahmúd of Ghazni; and Farishta, who describes the conqueror's progress on the occasion, mentions the existence of some temples in the vicinity, discovered by the Muhammadans, and then reported to be 4,000 years old! From the work under review, in allusion to the present state of things, we learn that for some months in the year its festivals are still frequent, and its pilgrims still numerous; and its continuous repute and old established prestige sufficiently account for the assertion of its panegyrists, that "a single day spent at Mathurá is more meritorious than a lifetime passed at Banáras."

Mr. Growse tells the story of the tutelary divinity of the spot with a freshness and comprehensiveness that give a somewhat needed attraction to an old tale; describes minutely the legendary scenes and historical area of the pilgrimage, and sketches briefly the history of the city from the remote period when it was a centre of Buddhism, down to the modern days of the Indian Mutiny. Then, the last act of its exciting drama closed happily with a darbar, at which the British Viceroy presided, rewarding those who had passed loyally through the trying ordeal.

A very recent historian of India, Mr. Talboys Wheeler, refers to "the substitution of the worship of Krishna for the old adoration of Buddha, as one of the most important phases in the history of modern Hindúism;" and quotes Fah-Hian, in evidence of a Buddhist revival, signs of which the Chinese pilgrim of the fifth century had remarked, on approaching Mathurá from the Panjáb. Mr. Growse believes the local triumph of Buddhism in this case to represent a mere episode in the history of an essentially Brahmanical centre, citing a popular couplet which allots it a place among the seven traditional sanctuaries of Hindustan. This gentleman's powers of research and appreciation are fortunately equal to the taste and energy he brings to bear upon the materials at his disposal. His chapter on the Archaeology and Topography of Mathurá and neighbouring resorts are most interesting; and in threading the mazes of these the reader cannot fail to acknowledge the value and competency of the appointed guide. Here, as elsewhere, the light of newly discovered monuments and inscriptions has

done much, during the last twenty years, to facilitate the retrospect of history and revision of chronology; and the suggested identification of Mathurá with Pandaea, however full of doubts and problems, affords room for fresh theory and discussion. The connexion of Madurá, one of the most Brahmanical of places in the south-east of the Indian Peninsula, with an ancient kingdom of Pandya, also referred to by Mr. Wheeler,* may perhaps be, after all, but another expression of the same idea; for Madura has been famous in its day, and once owned a college of profound though numerically limited *savants*. But as our author does not touch on this point, we confine ourselves to the mention of a hypothesis calculated to explain some probable confusion to be apprehended in a striking similarity of names.

The Second Part of Mr. Growse's work, notwithstanding its great value to Government in tabular statements and statistics, has not the same quality of popular attraction as the first. But if the details belonging to the descriptions of separate districts are of too local a character to interest the general reader, there are a few pages in the Appendix, on Indian Caste and Archaeological Research, which will amply repay perusal. Among other apposite and intelligent remarks dispersed broadcast throughout these printed evidences of earnest official labour, those on education merit very careful consideration. We are not sure what will be the opinion of the judges to whom we look for confirmation or refutation of opinions on all that is here said on this great subject; but we are sure that the speaker is not arguing without reason or experience when, after limiting the range of teaching in village schools, he thus expresses himself:—

"It is only when a boy displays exceptional ability in some particular line that he should be encouraged to develop it by a higher course of study. The cry that is being raised by certain utilitarians for the general establishment of practical schools of art and design is greatly to be deprecated. The ordinary level of art-feeling is already much higher in India than it is in England; and in almost every large town there is some special manufacture (as, for example, at Mathurá, the art of the stone-mason) which would inevitably be vulgarised and destroyed by our interference."

F. J. GOLDSMID.

POPE GREGORY VII.

Life of Gregory the Seventh, preceded by a Sketch of the History of the Papacy to the Eleventh Century. By M. Abel François Villemain. Translated by J. B. Brockley. (London: R. Bentley & Son, 1874.)

Grégoire VII., et les Origines de la Doctrine Ultramontaine. Par Edouard Langeron, Professeur d'Histoire au Lycée de la Rochelle. Deuxième Edition. (Paris: Ernest Thorin, 1874.)

THE question naturally asked about any history written by a Frenchman is, "What is it written to prove?" When this question has been answered, it is tolerably easy for any one acquainted with the outline of the facts to foresee at once the general scope of the book. Historic truth will naturally and

gracefully yield to the necessities of literary treatment. Great principles will be laid down in the presence of which it would be indecorous, almost ridiculous, to urge trivial points of detail. By the application of these principles the chief events are first broadly grouped, and then carefully arranged; great pains are taken with the draperies, and the light and shade has been elaborately studied. You are properly led up to the central *tableau*, which is then condescendingly explained to you, and you are sent away duly impressed.

Books constructed on this plan are very pleasant to read. Their characters are living and moving; the political and social *entourage* is made delightfully simple for us; we seem to become familiar with the chief actors, and recognise their motives as we would those of a diplomatist in a drawing-room. It is all so clear that we wonder how anyone can ever have made a mistake about it. Not until we lay down the book and think it over, do we find that the same method of treatment may be applied, and often has been, to the other side of the case. If the draperies be slightly ruffled, and the light thrown from the other side, how altered does the *tableau* become. The benevolent old man has a ruffianly cast of countenance after all, and the wicked king has a look of geniality and good humour which redeems his coarse expression.

M. Langeron has given a good specimen of this method in his treatment of Pope Gregory VII. The specimen is particularly interesting, because it is written with such openness and honesty that we can trace the entire process. First comes a preface stating the author's view of the functions of history. This is done in the form of a criticism of Bossuet's statement that history ought to be written for the political instruction of princes. Of course M. Langeron can here show his philosophic superiority to poor Bossuet, who lived in the benighted days before the Revolution, and who knew nothing of the sovereignty of the people. Had Bossuet lived in the present enlightened age, he would have said that history was for the political instruction of the people. This view M. Langeron is ready to accept: "Le but évident de l'histoire est de préparer les événements futurs par le tableau vif et précis des événements passés." He modestly admits that it is impossible for one man to deal with the whole of history: he must choose, according to the spirit of the age, some striking feature from the past, "quelque trait qui éclaire l'avenir de tous les reflets du passé; qui soit tout à la fois ancien par les détails, vivant par les idées; et qui puisse donner à ceux qui l'étudient une leçon, un modèle ou un exemple."

It would seem that the Vatican Council first turned M. Langeron's attention to Gregory VII. He is not afraid of the Council or the Pope, but he thinks it is high time that this sort of thing was put a stop to. He advances, therefore, with perfect sincerity and entire lightness of heart to expose and destroy Ultramontanism, by drawing from the life of Gregory VII. "une haute leçon de moralité politique."

Admirable as is M. Langeron's intention, we could have wished that he had advanced

with better equipment to the encounter. The modern historians whose works he has principally consulted are Bossuet and Voltaire, both of whom he seems to regard as very superior persons. He has drawn his information from Baronius and Fleury, and has occasionally looked up some of their references. He is, however, quite honest on this point, and there is something almost touching in his occasional displays of knowledge. On p. 31 he quotes generally "ses biographies" for a description of Hildebrand's personal appearance. On looking to the bottom of the page we find the following references: "Maimbourg, *Décadence de l'Empire*, liv. iii.; Lambert Scaff.; Malmesbury, *Reg. Gest. Angl.* liv. iii." That is to say, a Jesuit who compiled in the seventeenth century a short history of the Empire from the time of Charles the Great to 1356; a German monk contemporary with Gregory VII. who is writing merely a chronicle of German affairs; an English monk who was born about ten years after Gregory's death, and who in a tattling chronicle of the English kings has embedded a few vague hearsay stories about Gregory—these are all classed together, and these are the persons selected from all who have written about Gregory to be styled ostentatiously "ses biographies." Moreover, the particular point about which they are called to witness is Gregory's personal appearance. Two of them could not possibly have seen Gregory; and it is very improbable that Lambert ever saw him; their evidence, therefore, is not very valuable. Truly, Ultramontanism in France must be in a very bad way indeed if its fictions are to be at once destroyed by an assault conducted in such an off-hand way as this.

Still M. Langeron is very pleasant reading. He never sinks below the lofty level of instruction for mankind which he has preposed for himself. We feel how stupid and wrong-headed men were in past times. We see how simple their problems really were, if they had only possessed a little of our philosophic insight. We bitterly regret that the men of the eleventh century had not enjoyed the advantage of a few hours' instruction from M. Langeron before going forth on their high careers. It would have been so much easier for him to have put things right at the beginning; to have nipped Ultramontanism in the bud instead of testifying, as we reluctantly feel he does at present, to a thankless generation.

Turning from these rather saddening general considerations to purely personal ones, we are glad to think how much M. Langeron must have learned in the process of writing this little book. He shows a real desire to give us the benefit of all his erudition. Not only do we find small scraps of information scattered about in the text, but the "éclaircissements" consist of quotations from Voltaire about things in general, reprints from Baronius of two original documents, a long passage extracted from Mirabeau about the celibacy of the clergy, and a few original notes of M. Langeron's on such important points as the origin and number of General Councils, Excommunications, Necromancy, and finally the meaning of the title "Dom" applied to monks.

* See *History of India*, vol. iii., page 252, and note to page 206, for passages under reference.

M. Villemain is almost the complete opposite of M. Langeron. M. Langeron's book is short, M. Villemain's is long; M. Langeron is concerned with destroying Ultramontanism, M. Villemain is a Papal partisan, though of a moderate and judicious type; M. Langeron has read very little before writing his book, M. Villemain has read a great deal; M. Langeron gives us frankly his own opinions, M. Villemain does not seem to have any; M. Langeron shows us himself at every page, M. Villemain's meaning is shrouded in obscurity; M. Langeron gives us a bold dashing picture drawn on a large scale and clear and distinct, M. Villemain has no perspective whatever, nothing is large to him and nothing small, we are confused by a mass of details in which there is no grouping; finally, M. Langeron is inaccurate yet interesting, and his faults are amusing, M. Villemain is accurate and dull, and his faults are exasperating in the extreme.

In fact, M. Villemain is an instance of the sad fate that befalls a man of letters when he tries to turn himself without preparation into an historian. He has lost all his lightness of touch, and is as long and as dull as a German historian, without the justification of eradication or careful criticism where long study may have blunted the literary sense. His work shows signs of great care and labour, but it contains nothing that is new to the historical student, and is too dull and too minute in detail to interest the general reader. It expresses also no very definite view as to the general importance of the epoch of which it treats. The preliminary sketch of the Papacy is merely a dreary abridgment. We are not told what are the weapons which Hildebrand had at his command. The relation of the monastic orders to the Papacy, the growth of the Cardinalate, the custom of seeking the pallium from Rome, even the Isidorian Decretals are left entirely unmentioned.

Though M. Villemain's book is too long as it is, yet its omissions are many. M. Villemain has read all the authorities for the life of Gregory VII., and he gives us a *réchauffé* of the results, but he has not entered into the thoughts and opinions of the period in which Gregory lived. He has not followed out incidental points, nor has he in the least attempted to reproduce for us the moral, intellectual, or even political atmosphere in which Gregory's opinions developed and his character was formed. M. Villemain wanders confusedly among the details which he has collected, or pieces them together in a way that gives them very little meaning. Thus he never attempts an estimate of the character of any of the personages he brings before us, not even of Gregory himself. He does not sketch the social condition of the Emperor's court, or of Rome. There is only a very scanty notice of the great Abbey of Clugny, whose discipline first formed Hildebrand's character. We look in vain for any account of the monks who may be presumed to have influenced him in his early days. Again, M. Villemain barely alludes to the strange sect of the Paterea at Milan, and to Gregory VII.'s relations with them. He does not even trace through their different ramifications in social and political life

the ecclesiastical abuses which Gregory VII. was attempting to remedy.

If on the one side M. Villemain is not enough of a biographer to go in search of incidental information which may throw light upon his main character, he is, on the other hand, so jealous of his hero's supremacy, that he cannot allow to anyone else even a small share in Hildebrand's work. One of the most interesting points about the politics of the eleventh century is the mutual influence of ecclesiastical and political reforms. It was the organising policy of the great Emperor Henry III. that first suggested any definite shape to the vague desires of the reforming party which centered round the monastery of Clugny. Moreover, when those plans were formed it was only through the Imperial power that they could gain expression. The first steps towards reform were taken by the Emperor, and so a decisive stimulus was given to the zeal of those who hoped for better days. The Church and the Empire had sunk together since the days of the great Charles. The Empire rose first from its degradation, and only by its means did the Church rise as well. This is a most important point to notice, and the reforms of Henry III. require the attention of an ecclesiastical historian. M. Villemain cannot allow them any merit, but considers they were only an ingenious device for forestalling the efforts of the Pope. Thus Henry's attempts to put down simony, at a time when the Papacy was sunk in utter degradation, are only mentioned that they may be reprobated as an attempt to avoid a conflict with the Papacy.

"We perceive that the civil power foresaw the blow which the Church of Rome was soon to aim at it, by its obstinate refusal to tolerate lay investiture of religious functions, and Henry endeavoured to parry the attack by making an accusation" (*i. e.* endeavouring to suppress simony) "applicable to priests and laymen in common, stigmatising the abuse of the right which he desired to retain in his own hands."

The notion of Henry III. foreseeing a blow to be aimed against himself by the Church of Rome shows a misconception of Henry's connexion with the Papacy. He rescued it from the discreditable position of being an appanage of the Counts of Tusculum, and by inaugurating a line of German Pontiffs restored the Roman Church to some measure of consideration in the Western world. Fear of Rome is the most unlikely possible motive to have influenced the conduct of Henry III.

Another remarkable man, Pope Leo IX., to whom Hildebrand owed much, is similarly treated with only slight mention. No attempt is made to sketch his character or estimate the influence of his pious and determined mind on the schemes which Hildebrand was forming. M. Villemain will not allow either to the Empire or to the German Popes any share in the development of the reforming movement.

Very different estimates have been, and may be, formed of the character and plans of Gregory VII., but beyond a mild strain of approval running through the book, M. Villemain gives no definite statement of his opinion on separate points. He never seems to have asked himself plainly, What

was Gregory VII. engaged in doing? were his ends desirable ends? could they have been attained by any better means?

Yet these are the points to be considered in forming a judgment of Gregory VII., and in deciding our conception of his character.

A glance at the general condition of the eleventh century does not show us Gregory VII. to be, as M. Langeron regards him, merely an ambitious adventurer bent upon establishing his own universal supremacy. Nor yet does he seem only a Pope of extra-papal abilities cast upon extra-troublesome days, but who still pursued the traditional papal policy. So far as M. Villemain produces any general impression at all, this seems to be his conception of Gregory VII.'s historical position.

Wherever we look in the tenth century we see the same corruption in the condition of the Church. Its spiritual side had grown weaker and weaker. It was threatened with absorption into the hard system of society which the necessities of those troubled times had gradually produced. The lands of the Church were treated as lay fiefs, and ecclesiastical offices were given for purely political considerations. Bishoprics were becoming appanages of great families, and even tended to become hereditary after the example of ordinary fiefs. All spiritual meaning was passing away from the offices of the Church. The whole of society was tending to pass slowly under the galling oppression of the feudal system. Only in the monasteries was any idea of man's spiritual freedom kept alive, and from the monastery of Clugny especially did definite ideas of reform emerge.

But how was this reform to be carried out? what power was strong enough to make it prevail? The Empire was still the inheritor of great traditions of universal law and justice and order. It was the one power that had its foundations deeper than feudalism, and that appealed directly to broad principles for its authority. The revived Empire under the Ottos and Henry III. formed at least a centre of resistance against feudalism. Henry III. was great enough to accept the ideas of the reforming party. He freed the Papacy from its bondage to the Counts of Tusculum, and appointed a line of high-minded men who made the name of Pope once more respected throughout Western Europe.

When once the Papacy had been re-established, the reforming party, at whose head Hildebrand now began to stand, eagerly worked with and through it. Their plans now began to gain in definiteness, and soon found clear expression. They aimed, first, at making the Papacy entirely independent, that so it might work out unimpeded the reforming schemes, and might be strong enough to keep in order kings and bishops alike, if they should make common cause against its decrees. Thus established, the Papacy was to work for three great ends—first, the abolition of simony, that Church offices should no longer be trafficked in for gain, and used as a means of pecuniary profit to the holders; secondly, the celibacy of the clergy, for only men unencumbered by wife and children could hope to be free in those troubled times, and, moreover, the tendency of all

offices to become hereditary was a source of continual danger to the Church; thirdly, Church offices were no longer to be conferred by lay hands—the Church was to own her property and exercise her functions untrammelled by the obligations which royal or imperial investiture brought with it.

These were the objects which Gregory VII. with clearness and decision kept before him. With strong statesmanship he advanced to these ends. Political combinations were regarded by him as useful solely so far as they helped him towards this purpose. Gregory VII. was an acute and vigorous politician, possessed with a great idea, and bent upon working it out. The value of his idea can be judged only by reference to the time in which he lived, and the end which he had before him.

It is useless to talk generally of the relations between Church and State, and to assume that the questions involved between them are almost the same in every age. The Church owes its influence to the existence of a feeling of hostility against the State, or a sense of the State's inadequacy. The State rests upon a basis of material force, the Church only upon influence founded on conviction. The value of State or Church at any period of history can only be determined by careful consideration of the immediate tendency of the two powers when viewed in direct relation to one another. Then, casting aside the bondage of terms, the student who is tracing in history the realisation of man's liberty, will not doubt to which side, in each instance, his sympathies are to be given. In the eleventh century it was not the tyranny of the Church, but the tyranny of the feudal system that was threatening the very idea of freedom with destruction. In its war with feudalism the mediæval Church has a just claim at the present day upon the sympathies of all.

Now M. Villemain has not told us at all what Gregory VII. and Henry IV. were really fighting about, and M. Langeron has looked upon the whole matter as a conflict between the abstract State and Ultramontaniam. It is, therefore, scarcely to be wondered at that neither of them increases our knowledge of the times, or their meaning, or the problems they had before them.

We have before pointed out the many differences between M. Villemain and M. Langeron. There is, however, one point of agreement. Both are of opinion that Gregory VII. must have had something to do with Napoleon I., and that his life contains some direct political lesson for France. M. Langeron boldly draws an exact parallel between the two characters, and advises future rulers of France to beware of following either example. The passage is a delightful instance of ingenuity:—

"Tel fut Napoléon, j'allais dire tel fut Grégoire VII.; car ces deux noms se brouillent malgré moi sous ma plume. Sous le crâne éburné du moderne César, je sens bouillonner le cerveau brillant du moine de Cluny. . . . Grégoire VII. a réformé l'Eglise; Napoléon a organisé la France. Grégoire VII. a établi une hiérarchie qui subsiste toujours; Napoléon a créé une administration sous laquelle nous vivons encore. Le premier a voulu donner à l'Eglise une autorité sans limites sur tous les trônes; le second a voulu donner à la

France une prépondérance absolue sur tous les peuples. Grégoire VII. a rencontré un adversaire sans merci, Henri IV.; et pour l'abattre il a lancé contre lui les foudres de l'Eglise. Napoléon a trouvé une ennemie implacable, l'Angleterre; et pour la réduire il a inventé cette excommunication politique qu'on appelle le blocus continental."

M. Villemain knows too much about his subject to write like this. His parallel is between Henry IV. and Napoleon. Both were excommunicated, and both met with failures: hence the political moral to France, "Don't be excommunicated":—

"The antique formula, 'For these causes and by the authority of God Almighty, the holy apostles Peter and Paul'—this language, so scoffed at in the eighteenth century, coming suddenly from the lips of the Pope who had crowned Napoleon, was the first shock his power received. He whom no power, *human or divine*, appeared to arrest in his course, was sensibly affected by the anathema issued by the old man who was his captive. He rushed from south to north in search of reprisals and victories, and fell furiously on the world: he multiplied his human sacrifices; but still the wound rankled in his heart. Under this bull, uttered in language so long unheard—the voices, in fact, of justice and the law divine—he who had been the terror of humanity was crushed by the united forces brought against him, and by the consequences of his own fury."

This passage is a good illustration of the confused state of mind in which M. Villemain seems to be all through his book. The Papacy he regards as something neither "*human nor divine*," and yet as more potent than either. Napoleon was crushed "*under a bull of excommunication*," but we are glad to find that it was "*by the forces brought against him and by the consequences of his own fury*." This is rather a loose way of treating historical causation, and M. Villemain never rises beyond it.

We have quoted from Mr. Brockley's translation of M. Villemain, of which the above passage may be taken as a specimen. Mr. Brockley is careless in many points, and is hopelessly confusing in the matter of proper names and of titles, sometimes using English, sometimes French, and sometimes German or Italian forms. The nobles of France, Germany, and Italy are alike called "*seigneurs*;" and we find such expressions as "*the Château of Hartzburg*;" the titles of margrave and marquis are used at random; names of places are used arbitrarily, such as "*Placenza*," "*Brixena*," and we have the three forms "*Herfeld*," "*Hirsfeld*," "*Hersfeld*," to denote the same place. The startling name of "*John Scott*" is explained a few pages later by "*Scott Erigenus*." A cardinal of Roman birth, called by the chroniclers "*Hugo Candidus*," appears first as "*Hugh le Blanc*," and afterwards "*Hugh Leblanc*." The result of this confused inaccuracy is to make the translation quite worthless for any purpose of reference. M. CREIGHTON.

THE LAST BOHEMIANS.

Les Derniers Bohèmes. Par Firmin Maillard. (Paris: Sartorius, 1874).

MICROSCOPIC studies of the infinitely little are not unfamiliar or generally unwelcome forms of French biography. There is a special class of men of letters on the other side of

the Channel whose sympathies are exclusively with the pariahs, the lepers, the mites, the parasites of literature and art; who devote their time and talent to the description of the small eccentricities of the Great Unknown, the obscure individualities that exist but by virtue of a special *tie* or *mania*. The descriptions are not as a rule particularly profitable or edifying, but they are popular and amusing. They are indiscreet incursions into the slums and side alleys of a region which, despite its many historians and geographers, is still a nebulous unrealisable mystery for the average bourgeois reader. They analyse the intellectual maladies for which the bourgeois' doctor is never called upon to prescribe; they paint the sorrows he cannot comprehend, the errors he cannot pardon, the busy restlessness from which nothing ever seems to come—all the to him ridiculous glories, diseases, and recreations of Grub Street. And he is thankful for the slightest insight into the *terra incognita* of riotous depravity, impecunious cynicism, and audacious irreligion, that is suggested by the title, "*La Bohème littéraire*." This fact explains the success of Murger's more or less idealised sketches, of Champfleury's anecdotes, Dusolier's analytic romances, and Vallès' inimitable series *Les Réfractaires*. After the latter work M. Firmin Maillard's *History of the Last Bohemians* is the most graphic and impressive production on the subject of those *lazzaroni* of literature of whom Murger is the received, though not exactly the real type. M. Maillard demonstrates that the author of the *Vie de Bohème* was not the highest example of the class, nor its most unfortunate member. The Bohemians' centre and club-house—the famous *Brasserie des Martyrs* (a significant name), was frequented by many subtler thinkers, many loftier poets, many truer sufferers than the easy sentimentalist who said: "*La Bohème n'est pas un chemin—c'est un cul-de-sac*." There were men of ardent faiths, who had placed faith before everything—before daily bread; sincere, if passionate and prejudiced politicians; painters, musicians, actors, playwrights, journalists, inventors, who—had poverty not embittered them, had absinthe not enslaved—might have claimed some more honourable and enduring record of their lives than a paragraph or two in this biographical Book of Martyrs. Despite the Green Ruin and la Verte Bohème, not a few actually achieved a certain Parisian celebrity; and there were men who had strength and wisdom enough to use the small *café* pedestals as stepping stones—not as eternal monuments, Stylites pillars of pride; who passed through the *brasserie* into a broader life, and were not content to call to "*Baptiste*" for pipes and beer unto the day of their death. "*Le Petit Gustave*" retained only the best part of his Bohemian education, and developed rapidly into the Gustave Doré of our days. Gustave Planche found leisure between his visits to the *brasserie* to become the first critic of his epoch; Vallès shed the tatters of the *lazzarone* in due course; Baudelaire was something more than an idle *café* debater; Arsène Houssaye escaped from the narcotic atmosphere into an eighteenth century paradise of his own; many others

who could be named—Jules Andrien, Chénard, Tony Revillon, Millet, Nadar, for instance—issued from the Brasserie des Martyrs without leaving the best part of their wit and energy behind them, and took their places on a larger stage to fill more elevated parts.

With these exceptions, however, M. Maillard does not deal; and he is obviously inclined to regard them as renegades, late converts to the creed of Mrs. Grundy. His sympathies are all for the privates in the Army of Martyrs, for the nameless chorus that formed the noisy, mobile, bibulous background of the *brasserie*. He prefers the last Bohemians—Bohemians to the last—the men who were idle, eccentric, paradoxical and shabby all through. He has pity for their sufferings and apologies for their errors. He writes in the first page of his preface:—

“Be on your guard, reader, be on your guard against this book: it will make you smile at moments, but it may also make you weep. For it is at the bottom full of darkness and despair. The men who are here, dead before their day, fallen on the road, are not buried so deep down but that they can hear your hypocrisy prating of idleness, absinthe and courtesans; and some may rise and say to you: ‘When we came to be men, the future had ceased to exist for us; we were vanquished ere we could do battle. We arrived in the dead of night, a night of December, by a road wet with mud and blood; and, the soul sick with disgust, forced to stifle the love of liberty we had in our hearts, we took refuge in an artificial paradise.’”

As M. Maillard pictures it, the paradise does not appear particularly tempting even as an asylum. Its capital was the Brasserie des Martyrs—the vast manufactory of scandalous anecdotes, epigrams, paradoxes, revolutionary manifestos in art and literature; of the small evanescent organs of all kinds of eccentric schools and schisms; the Capharnaum of all the heterodox political and aesthetic sects that have arisen in Paris for the last twenty years; the eternal parliament where every innovator had his say; the permanent lists, where a thousand hobbies tourneyed. There were on one side the Realists, or Naturalists, presided over by Champfleury, in a nut-brown coat and jonquil cravat; Courbet, the maître d’Ornans—“sans idéal et sans religion;” Couture, the landscape painter; Millet and the minor poets, who practised realism by suppressing all rhyme. In a corner the song-writers, Paul Dupont, the socialist, Gustave Mathieu, Fernand Desnoyers, vociferated the ballads destined to procure the price of to-morrow’s dinner. In another a bard of the future proclaimed: “Lamartine, a piano; Hugo, a great man; Dupont, a great poet.” Elsewhere Baudelaire murmurs, with a satanic expression: “Have you ever tasted baby’s brain? It has the flavour of nuts.” Here, in 1859, was concocted the *Grande Fête du Réalisme*, about which the entire Parisian press was busy for more than a month. The programme of this extravagant buffoonery is a literary curiosity, and should not be lost. The fête is announced to take place in the studio of “Maître Peintre Courbet, Chef de la Peinture Indépendante;” and the programme is headed by a *polichinelle* drawn by Amand Gautier. The bill of fare is as follows:—

“To-day, Saturday, First of October 1859—

Great Festival of Realism. Last night of the season. (The painter Courbet will not receive this winter.) First performance of *Monsieur et Madame Durand*, a comedy in five acts and in verse, refused by the Odéon Theatre—read by the poet Fernand Desnoyers. The author of *Les Bourgeois de Molinchart*, Champfleury, will execute a symphony of Haydn on the bassoon. The interludes will be executed by MM. C. Monselet, G. Staal, A. Gautier, Bouvin, A. Schaan, and a host of other celebrities. Madame Adèle Esquiros will read an Epic Poem. Titine will perform a Cancan. Newspaper Reporters can sit down. *Andler Beer* will be consumed. The publisher, Pic de l’Isère, founder of the Parisian almanacks, *Jean Guétre* and *Jean Raisin*, will assist at the solemnity. Somebody will officiate at the piano. Great Surprises! *Physique Blanche!*”

The Last Bohemians expended an incalculable amount of patience and ingenuity in the preparation and execution of these elaborate mystifications; and their philosophy consisted in being content with such easy triumphs over the philistinism of society and the Academy, as proofs of the superiority of their schools and mode of life. The philosophy was not very elevated: M. Maillard is not blind to the fact. While it ennobles, to a certain extent, poets of the type of Albert Glatigny and Desnoyers, giving the pathos of Pierre Gringoire’s story to the chronicle of their lives; it debased and perverted natures like that of Potrel, of whom Vallès said: “Quand on aime tant les soufflets, on devrait avoir deux têtes,” Delvan, Duchesne, Hugelmann, and others whose political desertions and literary sins of plagiarism and venality were as much the result of the cynicism preached by the Brasserie professors, as of any natural predisposition. The mode of life was not remarkably pure or useful. It was adopted very frequently as an eccentricity, and continued as a habit—a habit that absolved whomever it possessed from the ordinary duties, responsibilities, and social restrictions of the working world—that gave him a gipsy’s passport, and left him free to spend his life chasing a butterfly, following an *ignis fatuus*, hunting a phoenix or chimaera. The curious indefinable industries represented in the Brasserie suggest an intentional and cultivated eccentricity on the part of M. Maillard’s heroes; an adoption of the untrodden byways of life, not because of a certain obliquity in the traveller’s mind and vision, but for the reason that they saw in byways royal roads to notoriety, roads where they were unelbowed and unrivalled. Thus one of the noisiest realists, Muratori, called himself a “psyllographe,” and devoted himself to the cutting out in black paper of landscapes and *genre* pieces, and to the obtrusive exhibition of flattering epistles from Jules Favre and George Sand. Another Bohemian affected the uniform of a nobleman’s courier, had balloons embroidered on his linen, and entitled himself “Aéronaut to his Majesty Napoleon IV.” There were poets who had founded the *Stéréoscopique-Journal*; an archaeologist editor of the *Moniteur de la Cordonnerie*; a satirist director of a Marionette theatre; a farce writer who had made a *spécialité* of confectionery; *littérateurs* who were at the same time fencing masters, manufacturers of biographies, dealers in exotic decorations—even a professor

of the “art of imitating vocally a pyrotechnical ascension.”

The sterile discussions and agitation of the gipsies of art and literature are well and amusingly described by M. Maillard, who has been a gipsy himself. But the key-note of his reminiscences is not by any means that of a carnival *cascade*. His book points a profoundly melancholy moral. Beside the Martyrs’ epigrams are their epitaphs. The Brasserie opened on *to the fosse commune*. One by one the wits, scholars, painters, and poets dropped away from the wooden tables, dropped away generally without a volume written, without a picture painted, and leaving behind them but the vague memory of a legendary attitude, a famous witticism, a ludicrous adventure—an episode or two added to the chaotic epic of the Brasserie. The lives of nearly eighty of the last Bohemians are summed up in the second portion of M. Maillard’s book, and scarcely ten of these lives yielded any enduring work, or ended happily—or even peacefully. Guillot, a poet, died *surveillant* of a cab-stand; Henri Hoffer, a painter, hanged himself before his easel; Grisière, the fencing master, became blind; Wuillot, the poet of *les Humbles*, was convicted of one hundred and fifty petty forgeries; Amédée Rolland, the best known and most talented poet of the circle, died a pauper; Charles Bataille, the novelist and critic, insane; Alcide Morin, scholar and poet, died at Bicêtre, after having discovered perpetual motion; Leclerc, the revolutionary painter, was found hanging to the railings of a tomb in Père la Chaise; Privat d’Anglemont, Fernand Desnoyers, died paupers; Delvan, Duchesne, Vaudin, Dupont were suicides; Pelloquet, the journalist, his tongue paralysed, fallen into a condition of semi-idiotcy, was arrested as a vagabond, and died in the hospital of St. Pons; Viard died of starvation; Baudelaire lost all memory two years before his death—the purist in literature could only pronounce a coarse Barrière oath; Cressot, a poet, died when a legacy permitted him to dine every day; Montjoye, the author of several popular vaudevilles, could take no nourishment save bread soaked in absinthe; Detouche, the satirist, attempted suicide twenty-two times! And this catalogue could be extended through several pages. The portion extracted suffices to indicate the spirit in which M. Maillard has written the chronicles of the Brasserie des Martyrs, and the species of moral instruction they convey. The literature of Bohemia has been very popular in France for the last fifteen years; but this its latest development is a decided improvement on Murger’s idylls and farces. It is real, and not merely a jocose representation of the disadvantages of impecuniosity and the art of making *mots* under difficulties. M. Maillard’s Bohemia is one of men who felt and suffered much, of exceptional natures—the Don Quixotes of the Imperial era. Murger was one of those whom Don Quixote excites to laughter; he was at heart on the side of Sancho. M. Maillard is more inclined to compassion and respect: his pennon is pinned to the lances that tilt against windmills; and his touch is pitying if not reverent in painting the last knights-errant of the Pen. Withal, he has not disguised or concealed

the fact that there are worthier targets than windmills, and a higher and more useful form of originality than Don Quixotism.

EVELYN JERROLD.

CURRENT LITERATURE.

The Life of Samuel Johnson, LL.D., together with a Journal of a Tour to the Hebrides. By James Boswell. A Reprint of the First Edition. Edited, with new Notes, by Percy Fitzgerald, M.A., F.S.A. In Three Volumes. (Bickers and Son, 1874.) Sir Joshua Reynolds once heard Johnson say: "There are two things which I am confident I can do very well. One is an introduction to any literary work, stating what it is to contain, and how it should be executed in the most perfect manner; the other is a conclusion, showing from various causes why the execution has not been equal to what the author promised to himself and to the public." A share of this double talent would be particularly useful to the modern editor of Boswell's *Life*, for a library edition of that marvellous work can scarcely afford to dispense with notes altogether, while it is clearly a case in which bad notes are worse than none. Mr. Fitzgerald's notes are not bad; they are moderate in volume, which, considering the immense mass of lawful matter for illustration to be selected from, is in itself a merit; they are not impertinently critical or too diffusely controversial, and the information which they give is fairly relevant and interesting. But the editor professes to have followed a principle in his selection, and we are not certain either that the principle is sound, or that it has been consistently followed, nor indeed that it is at once wide and definite enough to decide all the doubtful cases which the conscientious annotator must encounter. Mr. Fitzgerald proposes to give only such new information as (he conjectures) Boswell would have given if he could, and such explanations of obscure passages or allusions in the text as are needed "to illustrate, not so much Johnson's life as Mr. Boswell's view of that life." But the first test is valueless except in the hands of an editor with as much literary tact as Boswell's own; it might be made to justify half the trivial erudition of Croker; the second test is still wilder, because its practical effect could only be to emphasize the editor's view of Boswell's view of the real subject of Boswell's work. However, Mr. Fitzgerald is better than his threats, for after all he has done comparatively little editing, and with the exception of some typographical carelessness, there is nothing in these volumes to interfere with the reader's enjoyment of Boswell *au naturel*. The text is taken from the first edition of the *Life*, Boswell's subsequent additions and corrections are given in footnotes, and Malone's interpolations are banished; so many of Boswell's alterations are characteristic of his way, both of thinking and composing, that one is content to purchase the entertainment of tracing them at the expense of a good deal that is trivial, for it could scarcely be left to an editor's discretion to decide which various readings would be generally interesting and which not. Boswell's notes and the editor's are printed separately, which is of course right, though a source of confusion when there is a reference on the same page both in the author's text and his notes, as the printer, going by sight rather than sense, has put the editorial comments on the page of text, uniformly above his comments on the notes, which, if Boswell's note is read in its proper place, disturbs the natural order of thought. There is an instance in vol. iii., p. 96, a note of Boswell's having overflowed on to p. 97, Mr. Fitzgerald's note on that, calling attention to a noticeable improvement of Boswell's, is printed after a note to something on the middle of p. 97. In vol. ii., p. 444, a note belonging to one page is printed on another, and in the first volume the editor had not quite learnt to be consistent in translating Boswell's references

into their equivalents in his own pagination. In vol. iii., p. 367, n. 1, Miss Seward's name is mentioned when Mrs. Piozzi appears to be meant; and in vol. i., p. 384, actual nonsense is made of the text. Johnson's invitation, "get you gone in" (after a coolness when Boswell had irritated him by talking of the approach of death), being printed, "get you gone," in a curious mode of inviting me to stay—which it certainly would have been. These, it may be said, are trifles, and might easily be corrected; but a library edition of a classic ought to be at least faultlessly printed. One kind of alteration frequently made by Boswell in his later editions is the substitution of significant asterisks for a plain dash, and in editing the work of such a master of personalities it might be lawful to insert names that are practically certain even into the text, at least they should be given in notes; it is an affectation of critical purism to put "—"'s imitation of a made dish" (i. 288), where Croker has given the name; while we ought certainly to have been told (ii. 53) that the Miss — quoted as an instance of the uselessness of early cultivation was the lady best known as Mrs. Barbauld. When the person mentioned is absolutely unknown and uninteresting to the present generation, nothing but the name need be given; and in other matters, perhaps the safest rule for an annotator to follow would be to supply an answer to all the questions which the united ignorance and curiosity of the average reader—a fairly calculable quantity—would lead him to ask on a first reading of Boswell's work. The object ought not to be to empty the editor's note-book or memory of interesting facts bearing on the literary history of the period, but merely to enable a person previously unfamiliar with that history to read Boswell without being inconvenienced by his ignorance. Needless information should not be left out because it is to be found in previous editions, and matter that can be dispensed with should not be inserted because it is new. One of Mr. Fitzgerald's notes, though new, is certainly worth having (ii. 121), which gives a letter found among Sir George Rose's papers, dated April 11, 1776, in which Dr. Johnson applies in a tone of tranquil confidence to have apartments at Hampton Court allotted for his residence. The answer, a month later, is not a very courteous refusal, but Boswell was clearly unacquainted with any part of the transaction. Altogether the edition is one in which it is possible to read Boswell, though more thought and a great deal more mechanical industry would have to be bestowed upon it before it could be recommended as the most serviceable of its kind. It is unfortunate that the publishers of classical works cannot learn not to disfigure them by binding up advertisement catalogues.

THE virulence of Republican writers against Napoleon III. has been sufficiently condemned, even by the party of which M. Veuillot is the literary representative. The Legitimist historian is not necessarily mere moderate or merciful. Indeed the anonymous author of *Napoléon III.* (Paris: Lacroix) might teach a few epithets and vituperative adjectives to the poet of the "Châtiments." He is an adept in the *enguelement* (the word has been sanctified by episcopal utterance) which appears to characterise the foremost French defenders of throne and altar. Anti-christ and assassin are the fairest flowers of the Legitimist's rhetoric. *Napoléon III.* is dedicated to the memory of the "martyr" Emperor Maximilian of Mexico, and is chiefly designed to portray the late Emperor of the French in the character of a base seducer of political innocents and underhand dealer in Bourse speculations, and the Austrian prince as the victim of the Tuileries plots. Incidentally a biography of Napoleon is sketched; and here the contest between the author's antipathy to Louis Philippe and contempt for Louis Napoleon would be amusing were it not manifested in such a crude and colourless style.

The accuracy of the history may be estimated by two glaring examples. The Queen Hortense is said to have died in 1847, ten years after the real date; and Napoleon at the time of the Strasbourg attempt is called a schoolboy under the guardianship of his tutor, whereas the Prince was then twenty-eight, and his tutor, Lebas, had died six years before. The book is simply interesting as showing the radical division between Royalists and Imperialists.

Les Diverses Poésies de Jean Vauquelin, Sieur de la Fresnaie. Par Julien Travers. (Caen.) It is satisfactory to see that the heavy atmosphere of political disturbance under which the French nation has been living during the last few years has not wholly absorbed its energies; and that amid the uncertainties of dynastic and ministerial change, some men have found leisure and inclination to cultivate the genuinely national literature of a bygone age. In M. Julien Travers' annotated edition of the long mute poems of Jean Vauquelin, Sieur de la Fresnaie, we have an acceptable and much-needed rehabilitation of a French poet, born in 1535, who, in a century of bombastic, stilted modes of expression and servile affectation of classical modes of thought, struck out a path for himself after he too had for a time followed in the beaten track, and tried, in not wholly ungraceful idylls and lyrics, to describe the landscape surrounding him, and the men and women with whom he was brought in contact. Theocritus and Virgil were his divinities, and, like other zealous devotees, he strove to merge his own individuality in what he conceived to be a faithful representation of their nature; but as he had not their genius, he fortunately also lacked the faculty, shown by other imitators of the great classical masters, of distorting their imagery and converting their sensuousness into sensuality. With much affectation of style and insipidity of sentiment, the idylls, sonnets, epigrams, and other poetic effusions of the old Sieur have still sufficient merit of their own, and a special attraction in being the scholarly and refined exponents of the language, manners, thought, and acquirements of a French courtier of the later times of the Valois, to make this reprint of his works a welcome addition to the imperfectly cultivated history of the French poetry of the sixteenth century.

The Varying Tactics of Scepticism during the last 150 years. By the Rev. Robinson Thornton, D.D. (London: R. Hardwicke.) The writer has as correct an appreciation of his subject as can be expected, considering that he finds it so disagreeable that he blinks at it; he gives rather exaggerated prominence to the fact that there are unbelievers silly enough to suspect the New Testament of plagiarism from the Koran, and has devised a "mythical" theory of the Wars of the Roses, which is not wanting in a kind of heavy ingenuity.

The Unity of Creation. By J. K. Kingston. (London: Trübner & Co.) This little book is an example of the deplorable effects of Sunday lectures. The writer shows a native turn for wholesome thinking and feeling in his opening remarks on human ignorance, and something more in the description of Faith, and he has written out the received views on the connexion of mind and body correctly enough; but all this is rendered useless by a credulous avidity for speculating on what were reported to be the latest results of infant sciences, and an ignorant suspicion of traditions into which he cannot fit these in at once. If he must write on religion he had better work through the Psalms, or the *Dhammapadam*, or Pindar, and find out exactly what some serious school of religious thought really held, and what grounds they held it on, and clear his mind of cosmopolitan cant.

Hymns and other Verses. By W. Bright, D.D. (Rivingtons.) Nearly everything in this enlarged edition of Canon Bright's poems is valuable in proportion as it approximates to the nature of a

hymn. The verses upon subjects of travel and history have a man's solidity of feeling, but the æsthetic conception is that of a schoolboy; perhaps part of the charm of the hymns is the mixture of childlike simplicity with the maturity of an accomplished scholar: it is rare to find perfect clearness and some ingenuity in company with such shy, sober, wistful fervour. The writer looks at the intellectual fashions of the day from outside, and finds a solution of the questions so raised in applications of the Theology of the Incarnation. Among previous hymnologists he comes nearest to the late Dr. Neale, to whom he is certainly inferior in technical skill; on the other hand, many who would find Neale somewhat too wrapt up in private prettinesses might be attracted by Canon Bright's homelier verses. Two of the best poems are the hymn for St. Thomas's Day, and the verses on Singlemindedness.

La Chine, son Histoire, ses Ressources. Par Louis Strauss, Consul Honoraire de Belgique. (Bruxelles: Office de Publicité. Paris: A. (thio.) The scope of this work is somewhat extensive, for although it consists of rather less than 500 8vo pages, the author gives in that short space: 1. A sketch of Chinese history from B.C. 3000 down to our own times; 2. A description of China and its inhabitants, including political, social, literary, and other matters, in which portion of the book some space is devoted to "renseignements hydrographiques;" and, 3. An account of the products of the Empire, under which head, M. Strauss notices most articles known to commerce, besides domestic animals and fauna, mines of every kind, &c. From one or two indications, especially from the fact that so important a matter as the Chinese language is summarily dismissed in a page and a half, we are inclined to think that M. Strauss' practical acquaintance with China and her institutions is of a limited nature; but still, notwithstanding some inaccuracies, he has shown himself an industrious and painstaking compiler, and we doubt not that the work will very well answer the purpose for which it was designed, viz.,

"faire connaître au commerce et à l'industrie de la Belgique la situation politique, sociale et économique de l'Empire du Milieu, et contribuer à développer l'esprit de l'entreprise chez nos nationaux et nos relations avec les pays de l'Asie Orientale."

WE have received *Mattie Grey*, a collection of tales in verse and lyrical pieces, printed for private distribution. Both the tales and songs have a tame prettiness, but the prettiness of the author's monogram is piquant and enigmatical.

Songs of Many Seasons. By C. H. (London: Pickering, 1874.) Several of these poems have already been published in the *People's Magazine* and in *Evening Hours*. C. H. is soothing and edifying, and like Miss Proctor with the poetry left out.

NOTES AND NEWS.

DR. E. A. FREEMAN will deliver next season at the London Institution a course of six lectures on the "History and Use of the English Language." The other lectures hitherto arranged will be given by Professors Rolleston ("Early Inhabitants of England"), Ferrier ("Functions of the Brain"), Armstrong ("Chemistry of Plant and Animal Life"), Morley (English Literature), Bentley (Botany), and Ella (Music); Sir John Lubbock, Dr. Carpenter (Marine Zoology), and Dr. Zerffi (Art).

WE hear that a collected edition of the poetical works of the late Mr. Sydney Dobell is in active preparation, and may be expected to appear about Christmas. The sympathetic article on Mr. Dobell, published in *Good Words* for the present month, is from the pen of the authoress of *Caste* and *Colonel Dacre*.

MR. FOX BOURNE, sometime editor of the *Examiner*, is at work upon a life of Locke.

THE task of editing the Journal kept by Colonel Egerton-Warburton during his recent successful explorations in North-western Australia, has been entrusted to his nephew, Mr. Charles H. Eden, author of *My Wife and I in Queensland*. It will be published by Messrs. Sampson Low and Co., and may be expected early in the coming year.

PROFESSOR FRASER, the editor of the *Life and Works of Berkeley*, published by the Clarendon Press, is about to publish *Selections from Berkeley, with an Introduction and Notes, for the Use of Students*. The aim of the book is "to fill a place, not now occupied, as a manual of convenient size, based on the writings of a famous English philosophical classic, for introducing students in the universities and others, through him, to modern psychology and metaphysics."

THE annual distribution of prizes to the pupils of the Metropolitan Government Schools connected with South Kensington took place last Wednesday. The Lord Mayor presided; and in giving away the prizes spoke of the great value of art training as a means of culture, and especially of the advantage of a knowledge of drawing to mechanics. A resolution was afterwards passed pledging the meeting to the promotion of artistic and scientific education.

ON Thursday, October 22, a proposal to hand over the *Hour* from its present limited proprietary to a joint stock company, including many leading members of the Conservative party, will be decided. The old shareholders are to come into the new company *pro rata* to the moneys subscribed. The *Hour* will be printed at the Central Press Office, 212, Strand, the editorial staff remaining the same. The capital already guaranteed amounts, we understand, to 100,000l.

THE *Lincolnshire Glossary* of Mr. Peacock, which we mentioned in our last, will be a glossary of the dialect of the wapentake of Manley only, i.e., of the Isle of Axholme and a stretch of land of about the same size on the east bank of the Trent. It will, no doubt, be a pretty complete word-list for the whole of the northern part of Lincolnshire; but the author has felt it to be best to restrict his labours to the above area, with which he has the most complete and particular acquaintance.

WE understand that Professor Seeley's *Life of Stein* is expanding into a general view of the changes which took place in Germany in the Napoleonic age, and an introduction to the history of the Germany of our own age.

THE Lectures and Classes on Egyptian and Assyrian Languages and Literature, announced last month as being carried out under the sanction of the Society of Biblical Archaeology, will soon be inaugurated. The following are the tentative arrangements already come to:—Dr. Birch is to give six lectures on the early history of Egypt (the first twelve Dynasties), and later on a second course consisting of two lectures on the period of the Shepherd Kings, and six on the Revived Empire (XVIIIth and XIXth Dynasties). Mr. C. T. Newton will deliver a couple of popular lectures on the influence of Phœnician on Greek Art. Mr. George Smith, eight lectures on the early history of Assyria and Babylonia. M. Le Page Renouf, as many lectures as may be required on the Egyptian Alphabet and its affinities; also a second course on Egyptian Literature, probably in December. And in February, the Rev. A. H. Sayce will begin a course of lectures on the Syllabary, Grammar, and Philological Bearings of the Assyrian language.

The classes will be conducted by the Rev. A. H. Sayce, and M. Le Page Renouf, and will probably begin work early in the spring of 1875, meeting in the evening; but the dates are not yet fixed.

A NEW Grammar of the Assyrian Language is in preparation by the Rev. A. H. Sayce, and of the Egyptian language by M. Le Page Renouf, giving the alphabetic characters, determinatives and more usual variants, followed by a praxis and short vocabulary, and some historical data, lists of deities, kings, &c. A detailed syllabus of each lecture will be distributed among the students for home work. As the teachers, as well as the lecturers, are nobly giving their services gratuitously, from the pure love of science, and as a guarantee fund of 100l. for working expenses is being privately raised among the members of the Society,—the classes will be free of expense. In addition to this, although a knowledge of the Hebrew alphabet alone would be useful for the Assyrian, and a knowledge of the Coptic characters for the Egyptian, yet no preliminary knowledge will be demanded. It is to be hoped that the enterprise may be well supported by all *bond fide* students. The Secretary of the Society, Mr. W. R. Cooper, will be happy to afford further information. Address 9, Conduit Street, W.

THE part of *The Proceedings of the Society of Antiquaries* which has been issued during the last few days contains a report of the discussion that took place in the Society's rooms on April 30, relative to Dr. Schliemann's discoveries on the plains of Troy. [See report in *ACADEMY*, No. 104, p. 496.] We have also (Feb. 19) a condensed report of an interesting paper by Mr. James Fowler, on pictures of Time and Death in our parish churches. It seems that after the Reformation, when all the "popish" ornaments had been covered up with whitewash, it became the practice to adorn the western walls with these grim figures. What was called "taste" in the last century, and "restoration" in ours has caused most of these paintings to be swept away. It is well they have not all utterly gone without any memorial of their existence being preserved. They were, as Mr. Fowler has very truly pointed out, "a paganised version of the skeletons in the Gothic Dances of Death, in which the idea of a future, as indicated by different ranks of men being led off somewhere and to something is rejected, and Death represented merely in the abstract as Death, the end alike both of our hopes and of our fears."

During the last session of the Society, the "herse-cloths," or palls, of sundry of the London livery companies have been exhibited at Somerset House, and are here carefully described. It is much to be wished that coloured engravings were published of these most interesting specimens of mediæval embroidery.

M. WAILLY, in the recently issued *Mém. de l'Acad. des Insc. xxviii. 1^e partie, p. 263, et seq.*, defends at some length the text of his lately published edition of *Joinville* from the critical attacks of M. Viollet in the *Bibliothèque de l'Ecole des Chartes*, and of le Père Cros of the Society of Jesus in a learned work on the private life of St. Louis. In an appendix to the paper is a restoration of the text, in mediæval French, of the so-called *Enseignements de Saint Louis*.

WE hear that Mr. Basil Champneys will shortly bring out a work entitled *A Quiet Corner of England, being Studies in Landscape and Architecture in Winchelsea, Wye, and Romney Marsh*. It is to be illustrated by a large number of typographic etchings, and will be published by Messrs. Seeley, Jackson, and Halliday.

THE Manchester Branch of the New Shakspeare Society has made the welcome announcement that it is now strong enough to run alone, and that it has papers enough by its own members to supply its own meetings, without relying on the parent Society. This is as it should be; and Manchester may now be counted as an independent centre of Shakspeare work, though it still remains in alliance with the New Shakspeare Society. We only hope that the Manchester Branch will throw out fresh shoots in the neighbouring towns.

THE winner of the Early English Text Society's prize in Iowa College, United States—examiner, Professor Barnes—is Mr. E. C. Jones.

AN interesting fact in relation to the final *e* dispute in Chaucer is mentioned by Mr. Henry Sweet—that the Jutland dialect of Danish has altogether dropped the final *e*, while the standard language maintains it. Mr. Sweet considers that the present Danish and Dutch are in the same stage of development as the English of Chaucer's time, while modern German represents the earlier stage of Anglo-Saxon. The development (or degradation, as it is sometimes called) of English was wonderfully rapid.

DR. RICHARD PAUL WÜLCKER, of Leipzig, has been in England for the last three weeks, collating the text of his *Early English Chrestomathy*, Part I., A.D. 1250–1350, which will be published in a fortnight, with full notes and a complete glossary. The second part of the book will come down to 1500 A.D. Dr. Wülcker is, like so many of his learned brethren, a soldier. He was wounded at Würth, where he won the iron cross for the capture of a mitrailleuse, losing four out of his five comrades in the attack. He served again before Paris, and is now a lieutenant in the Landwehr.

DR. ERNST WÜLCKER, of the Archives at Frankfurt, is henceforth to edit alone the *High and Low-German Dictionary*, which he and Dr. Lorenz Diefenbach have hitherto edited jointly, and which contains a very valuable collection of ancient words down to the sixteenth century, drawn from the archives at Frankfurt by Dr. Wülcker, together with modern provincialisms and words from other sources got together by Dr. L. Diefenbach. No word is admitted which is in the brother Grimm's great dictionary, so that Dr. Wülcker's book will form a necessary supplement to that work. Two parts, down to *braunheit*, are all that are yet published.

A FOURTH edition of the work on "Congregationalism," by the Rev. Henry M. Dexter, D.D., has just issued from the press at Boston. It has been subjected to large revisions, with especial reference to the religious statistics of the States, and contains beside much new matter bearing on the subjects in review at the late Brooklyn Council.

THE Congregational Library at Boston grows apace, liberal donations of old and scarce works relating to the colonization and church government of New England having been made to it during the past year. Upwards of 17,000 volumes, and nearly 70,000 pamphlets, now line its shelves. The new library building will presently be called Hitchcock Hall, in memory of Mr. Samuel A. Hitchcock, who gave 5,000*l.* just before his death for its internal decoration and furnishing.

THE *Daily News* gives a curious illustration of the anomalous position held by actors and playwrights two centuries ago. "A certificate of baptism," it says, "has been discovered in Paris, dated March 30, 1671, in which Molière, as godfather, is registered as '*valet de chambre* of the King,' and 'having no fixed domicile.' No allusion is made to Molière's occupation as actor and manager, or to his work as a dramatic poet, although the *Misanthrope*, the *Tartuffe*, the *École des Femmes*, and indeed all the plays on which he and the literature of his country have become famous, were written long before the date of the certificate. The description of the poet as having no fixed domicile seems like an equivalent of the '*vagabonds*,' while the *valet de chambre* reminds us of the title of 'Her Majesty's Servants' by which our own actors and playwrights have been variously designated." It is further noted that Massinger's "name was recorded in a burial register of St. Saviour, Southwark, with the words 'a stranger' appended as his only description."

DR. ALFRED VON SALLET has attempted, in a pamphlet published by the Weidmanns, Berlin, to show that many of the portraits and other drawings in the Berlin and Weimar collections,

which are known as Albert Dürers, have no claim to be regarded as the productions of the great master. According to the author, who adduces strong arguments in favour of his hypothesis, these drawings were the copies of medals cast at Nürnberg, and may be referred to the same period, and not to the early age claimed for them.

THE sixth edition of Dr. Ranke's *History of the Popes* has just appeared under the modified title of *The Roman Pontiffs during the last Four Hundred Years* (Duncker und Humblot, Leipzig, 1874).

A CELEBRATION in honour of the old Minnesinger Walter von der Vogelweide, was held on October 3 at Waidbruck, in the Tyrol, when Dr. Johannes Schrott delivered a laudatory address on the uncovering of the mural tablet that had been erected to his memory at the old manor house of Vogelweide. A large assemblage from every part of the Tyrol had gathered together to do honour to the old Singer, whose couplets and rhymes are still cherished by the people of the mountain districts in which they were first recited.

THE Munich obituary for last month included the name of Franz Xavier Richter, a man but little known beyond his own immediate circle although there he not undeservedly ranked as a second Mezzofanti. Richter, who was vicar of the Court church of St. Cajetan at Munich, not only read and understood, but could speak, seventy ancient and modern languages. This "European unicum," as he has been termed by Professor Haneberg, was a man of modest unassuming manners, who devoted all his leisure to study, and was much esteemed as a private teacher. Owing to ill health he had been compelled in the early part of the year to throw up his ordinary occupations and retire to his native village, Ruchberg, where he died on September 26.

THOSE who busy themselves with historical research are apt sometimes to grumble at the little way which they make with the world. They fancy that they have done something to elucidate this or that point of history—they have settled a disputed point by an article in the *ACADEMY*, or by a paper read at the Society of Antiquaries. All at once up springs a popular writer, and mixing up old blunders and new ones, dishes up in the most attractive form a story which has very little foundation on ascertained facts. After much experience such students will not be extreme to mark offences in amateur historians, and will welcome the help given by anyone who, without any special or recondite knowledge, yet shows that he is possessed of an eye open to recognise the due proportions of the tale told by the old authorities, and a true judgment to dispose of the popular fallacies which pervade so many of the dicta of modern interpreters. The present number of the *Contemporary Review*, for instance, contains an article by Mr. Peter Bayne, entitled "Charles I. and his Father," which is full of inaccuracies in detail, but which is written with an insight into the real characters of the persons with whom the writer is concerned which would place Mr. Bayne very high in the ranks of historical writers if circumstances had led to his devoting himself more entirely to the study. We may be allowed to express our entire disbelief in such assertions as that James had any intrigue with Somerset in the last year of his reign, or that Richelieu absolutely forbade Buckingham returning to France after his visit in 1625. But even if a large number of readers swallow these statements whole, they will be nearer the true history of James's reign after reading the article than if they had digested a whole cartload of popular histories. It is a fortunate accident which has secured Mr. Bayne's paper a wide circulation by placing it in a number which has already, from other causes, achieved a tenth edition.

DR. C. A. BURCKHARDT, Keeper of the Archives at Weimar, is preparing a *Handbook of the German and Austrian Archives*. This will not only deal

with the public archives of the German States, but also with those of the towns (some of which, as Frankfort-on-the-Maine, Nürnberg, Goslar, Worms, &c., possess extremely valuable archives), with those of the provinces, and with all such private archives as are accessible to the use of the historical enquirer. In addition to the names and locality of the archives and their history, the author promises an account of the documents they contain, the officials who have charge of them, the conditions of using them, and other information of a similar kind. His work will, therefore, be in the highest degree valuable to the historical enquirer, and it is to be hoped that full information will be accorded to him by the officials in charge of private archives. At the same time, Dr. Burckhardt invites a congress of the officials of German archives to meet at Eisenach in 1875.

DR. MAX LENZ, of Greifswald, is preparing an exhaustive work on the treaty of Canterbury, which was concluded August 15, 1416, between the Emperor Sigismund and Henry V., King of England, and which had important influence upon the Anglo-French wars in the fifteenth century. Dr. Lenz had already published at Greifswald a precursor of this work as his dissertation for his doctoral degree. We learn therefrom that the *Gesta Henrici Quinti*, published by Williams in 1860 for the English Historical Society, were compiled by Thomas von Elmham, "Prior Monasterii S. Trinitatis Lentoniae," while Dr. Lenz is doubtful whether the *Vita Henrici V.*, published by Thomas Hearne, Oxford, 1727, under the name of Elmham, is the work of the prior for whom Hearne claimed it. After the proofs of ability given in this dissertation, we may look forward with good hope to the further researches of Dr. Lenz.

NOTES OF TRAVEL.

COLONEL STOLETOF has communicated to the *Invalide Russe* further details respecting the progress of the Amu Daria expedition. Starting from Nukus on July 23, the *Perovsky* steamer ascended the Amu and arrived at Petro-Alexandrovska on August 9. This was slow work, but soundings had to be made frequently and the current was very rapid, so that the steamer, which is only 40 horse-power, could not make much way. The Colonel is of opinion that a stronger vessel of light draught could ascend the river as far as Khojah Saleh, where fuel depôts established along it at intervals. From Petro-Alexandrovska Colonel Stoletof, the captain of the *Zoubof* corvette, and Major Herbert Wood, have gone on in *kayuks*, or native canoes.

SOME very curious statistics respecting the arrival and departure of foreigners into and from Russia are given in the *St. Petersburg Gazette*. We cannot reproduce them at length, but we observe that the numbers have increased sixfold since 1830; that the number of those who come or go by the European frontier is ten times as great as that of those who cross the Asiatic border; and the nationalities of the travellers run mainly in the following order:—Prussians, Austrians, Turks, French, and English.

M. LARINO has recently furnished to the Commission of Commercial Geography in Paris some interesting details respecting the province of Paz, in Bolivia. It is remarkable for its great variety of climate, the temperature ranging between great cold and a tropical heat, for excessive moisture in some places and a desert-like, parched-up appearance in others, and for its richness, not only in vegetable products, which are especially favoured by the climatic conditions, but also in the precious minerals. The population of the province, according to the last census, is 593,799; but this is probably 600 less than the true number. The capital, Paz, is situated in an irregular valley, at one time apparently watered by a canal, the bed of which is now called Choquevapú, or gold-stream. Gold is also found on Mount Illimani, a mountain

27,574 feet in height; but the broken and rugged ground, and the great height at which it is found, preclude the possibility of its being worked. The town itself is 12,195 feet above the level of the sea; it numbers close upon 76,000 inhabitants; and was founded under the orders of Pedro de la Gasca, Governor of Peru, so as to serve as a commercial station between Cuzco and Sucre. It is interesting as being one of the first towns that shook off the Spanish yoke and proclaimed the independence of South America. Among its products rank the following:—tobacco, cacao, coffee, vanilla, and maize, while the forests are rich in fruit trees and trees suitable for building purposes. Wild beasts, such as pumas, leopards, bears, and monkeys, as well as parrots of the most beautiful description, are to be found, but civilisation is rapidly driving them to the Cordilleras.

THE official gazette of Archangel states that the White Sea has been this summer visited for the first time by members of the Russian Yacht Club. On July 13 last the yacht *Viliu*, with Prince Wittgenstein, Colonel Gennsen, and twenty-five men on board, visited Kola, having come thither by way of Norway.

SINCE the visit of the Lieutenant-Governor of Bengal to Sikkim the bonds between the British Government and this little native state have been much strengthened. Sikkim is an important state, because through it lie the best routes for approaching Tibet, and so securing a profitable market for Assam tea and Bengal indigo, to say nothing of Leeds, Manchester, and Birmingham goods. Though precious minerals are tolerably plentiful, the real wealth of Tibet lies in its flocks and herds, these being of excellent quality and most plentiful. The climate is admirably suited for Europeans, being high and dry; and Chumbi Valley, which is a tongue of Tibetan territory near to Darjiling, would, from all accounts, prove a pleasant residence, as well as supply the best *point d'appui* for an attempt at establishing a trade. The only great obstacle in the way is the conservative and exclusive spirit of the Chinese, who guard the frontier most vigilantly, and allow no foreigners to enter. This, it has been proved, is solely due to orders from Peking, and efforts have been made to obtain a remission of them, but in vain. The last excuse given was that the minority of the Emperor precluded the question from being mooted, but it is said that an endeavour will soon be made by Her Majesty's consul at Peking to get the matter satisfactorily settled. There will be but little difficulty in getting the Sikkims to do their share. Our treaty with that state provides that any road made through the country is to be maintained by Sikkim, who will also erect suitable travellers' rest-houses throughout its route. Moreover, the allowance paid to the state by the British Government has been lately substantially increased, under the express condition that it shall do its best to promote trade with Tibet; and it is so much in dread of its big neighbour, Nepal, that the Bengal Government anticipate no difficulty in securing its entire co-operation.

THE mountaineers and dalesmen of the southern slopes of the Tyrol are complaining, apparently not without reason, of the injurious results of the wholesale destruction of the forests on the Italian frontiers, where the woodland districts have been handed over to companies by the communes to which they belong, and trees have been cut down without the slightest regard to the effects of the sudden and complete denudation of large tracts of land. No season on record can show such a fatal list of destructive land-slips, falling of rocks, overflowing of streams, and other disastrous disturbances as the past summer; and those who are acquainted with the injury produced by the removal of large masses of trees, as witnessed in Southern France and Northern Italy, will have no difficulty in appreciating the force of the complaints made by the Tyrolese. Trees bind the soil together by their roots, and thus tend to keep

detached masses of rock *in situ*, while by their powers of absorption they constitute the very best means for preventing undue distribution of water, which without such natural channels either accumulates at individual points where the soil is not specially porous, or drains through loose earth, leaving it dry and unfruitful.

COLONEL HENRY YULE, C.B., in a private letter dated Palermo, October 1, to a correspondent in London, writes:—

"I forget if I mentioned that on the 14th inst. we had here a genuine Bengal cyclone, though of brief duration. Our active observer, Tacchini, is away after Venus, and I have seen no account of it. It levelled many walls, and carried half of my roof away (zinc on timber). An old woman saw the roof flying, and thought she had seen a new miracle of the Santa Casa di Loreto."

In a characteristic article in the November number of the *Mittheilungen*, Dr. Petermann enlarges on the results of the Austro-Hungarian Polar Expedition. After alluding to the heroic nature of the exploit, and comparing the leaders of the party to Columbus and Vasco de Gama, he turns with some inward satisfaction to his own writings on the subject, and points out that ten years ago he took up the subject of Arctic exploration, and exhorted his countrymen to action; but, instead of following in the wake of numerous English expeditions up Baffin's Bay, he counselled them to turn and explore systematically the comparatively new and unknown region between Greenland and Novaya Zemlya, and as a first trial advised the despatch of a steamer along the east coast of Greenland. The correctness of his view, he urges, is now borne out by the importance of the discoveries made in the eastern quarter of this field of research. In an article which follows, Dr. Joseph Chavanne goes even further than Dr. Petermann himself, and makes out that the latter has always specially advocated the sea between Spitzbergen and Novaya Zemlya in preference to the Smith Sound and the East Greenland routes. Dr. Chavanne also argues that the north-westerly drift of the *Tegethoff* is indisputably the work of the northern arm of the Gulf Stream. This arm, he contends, encounters the united stream which proceeds from the mouths of the Siberian rivers, and the consequence is a concentration of all the drift ice in one place, which according to local circumstances favours or hinders navigation. Dr. Chavanne concludes by emphatically asserting that it is the duty of England, as the first of naval powers, to recognise the importance of Arctic research by despatching an expedition next spring. Some details are given by Herr Littroff respecting the crew of the *Tegethoff*. These came principally from the town of Fiume, on the Adriatic, and were selected by Weyprecht on account of their hardiness, pluck, and cheerfulness; his experience having told him that northerners, though inhabiting a colder climate, are less able to adapt themselves to change of living than Dalmatians.

GOTLAND, the largest and most important island belonging to Sweden, has a history well worthy of a chapter in the romance of trade. As far back as the eleventh century its commerce with the East, by way of Novgorod, was of great importance, and in 1158 Wisby, its chief, and indeed now its only, town, was declared a free city by the Emperor Lothair. England, France, Holland, Russia, Lubeck, and Rostock had warehouses there, and King Henry III. of England, by a letter dated 1237, granted the merchants of Gotland liberty to trade all over England free from duty. The valuable and yearly recurring finds of Oriental coins and ornaments, as well as of Anglo-Saxon and German coins, testify to the former commercial intercourse between the East, England, Denmark, and Germany, and this island. The fall of Wisby is commonly attributed to its subjection by the Danes in 1361, but, with greater justice, perhaps, to the discovery of the new passage to India by way of the Cape of Good

Hope in 1498. Wisby was restored to Sweden in 1645, but until recent years its government has been very neglectful of its interests. The architectural remains spread over the entire island, are of great attraction and beauty. The inhabitants still glory in and cherish these memorials of fallen greatness, and although Gotland may never recover her former magnificence and prosperity, there is every reason to expect an increasing development of her agricultural and commercial resources. The province now numbers about 55,000 inhabitants, who, besides agricultural and pastoral pursuits, occupy themselves with coasting and foreign navigation, fisheries, lime burning, stone quarrying, &c. Wisby, as previously stated, is the only town, and the seat of the Governor, and a bishopric; the population is about 6,300, of whom, according to the latest return, 82 are merchants or tradesmen, and 185 manufacturers and artisans.

THE latest printed official report by Consul West tells us that the town of Suez is still much neglected, and that the local officials, sanitary or other, are as little inclined as ever to attend to its cleanliness or salubrity. No arrangements whatever are made either for locating the long train of pilgrims which arrive there on their way to the holy cities of Mecca and Medina, or for removing the filth which inevitably accumulates in the open spaces in the town, where they are allowed to encamp regardless of all order or decency. And while the Khedive has been induced to spend many thousands of pounds in building and dredging a spacious wet dock, which is useless even for his own steamers, not a single effort has been made to improve the town or to extend facilities for the local traffic; not even a shed or cover is erected to shelter the goods landed there, despite the very heavy custom-house charges upon them. "Suez," concludes Consul West, "seems indeed to be treated as though it were not part of the dominions of the Khedive, and unless some European can manage to make a 'plant' on the Viceroy in the shape of a contract, does not seem to be worth the attention of the Egyptian Government."

PALESTINE EXPLORATION FUND.

THE Quarterly Statement of the Palestine Exploration Fund contains an account of the very interesting identification of the site of the ancient Levitical city of Gezer, in the territory of the tribe of Ephraim, by M. Clermont-Ganneau. M. Ganneau had already, in 1873, communicated to the Paris Geographical Society a passage in the historian Meir-ed-Deen, in which an account is given of a skirmish which took place between the village of Khulda, whose site is known, and a place called Tell-el-Gezer, and identified this place with Abu-Shusheh on topographical grounds. On a careful examination of the ground in the present year, M. Ganneau discovered two identical bilingual inscriptions, in Greek and Hebrew, cut in the rock, and probably of the Herodian period. The Greek letters read as ALKIO; the Hebrew inscription is translated "the limit of Gezer;" the word for "limit" being that used in the Talmud in speaking of a Sabbath-day's journey. One of these inscriptions lies east of Abu-Shusheh, and the other lies north-west of the former, and as a third inscription has been found later to the south-west of the first, it seems to be evident that we have here one of the angles of the square, with sides of 2,000 cubits, which, as we learn from Numbers xxxv. 5, formed the boundaries of the suburbs of the Levitical cities. The position of these three inscriptions in relation to the numerous remains of an ancient city, which were found on the plateau of the Tell-el-Gezer, should enable us to determine the extent of the square, and further examination of the ground may bring to sight other similar inscriptions. Light may possibly be thus thrown on that vexed question, the length of the Jewish cubit. M. Ganneau points out that the sacred boundary

must have been a square, having its four angles at the four cardinal points, and not, as usually supposed, its sides. As hitherto the site of Gezer has been generally placed at Yasur, the form and extent of the territory of Ephraim, of which tribe it was a frontier town, must be very materially modified in our maps of ancient Palestine. Gezer was one of the royal cities of the Canaanites, and is mentioned several times in the account of the wars of David and the Maccabees. It was destroyed by the Egyptians, but it was restored to Solomon as part of the dowry of Pharaoh's daughter, and rebuilt by him.

LUDVIG BÖDTCHER.

THE patriarch of Scandinavian literature, the poet Ludvig Adolf Böttcher, died at Copenhagen on October 2. He was the only survivor of the Augustan age of Danish poetry, having been a contemporary of Øhlenschläger and Grundtvig, of J. L. Heiberg and Hauch, and he has preserved to the last a living place in the intellectual life of his country. He was born on April 22, 1793, and entered the university at the very moment when the revival of poetry and art was at its height. He had scarcely finished his studies when he came into possession of sufficient property to enable him to enjoy his life: poetry, music, and the plastic arts became the sole employment of his mind. In 1824 he went to Italy, where he remained until 1835, being settled for the most part in Rome, where he held a little court for Scandinavian poets and painters; here he became acquainted with Thorwaldsen, and a friendship of the warmest intimacy sprung up between them, broken only by the sculptor's death. It was almost wholly owing to the shrewdness of Böttcher that the Danish Government was enabled to save the works of Thorwaldsen from the clutches of the King of Bavaria, and when the treasures were brought from Rome the poet came with them to Denmark.

Ludvig Böttcher is one of the most finished poets that the North has produced; the entire collection of his works is no larger than the poems of Thomas Gray, but every one is a gem, cut and engraved with the most exquisite precision. His lyrics have an artistic preciousness that is not common in Scandinavian work, yet notwithstanding this quality of refinement, they are universally admired and appreciated. No old poet ever spent his last days in a more happy atmosphere of affectionate homage than Böttcher, nor did any young Danish author think his success complete if he had not been welcomed in the old-fashioned little room in Sværtegade.

The present writer will not easily forget his visit there in the spring of this very year. It was just after Whit Sunday, the day when all Copenhageners that possibly can leave town, wander out into the glorious beech-woods, and come back waving long sprays of the clear green leaves. Böttcher had been too feeble to go out, but in his window was growing a young beech tree, that he had planted in water. The leaves were just out, the sun shone through them, and the old man sat rubbing his hands with pleasure at the luminous green colour. "Are they not as good as flowers for me?" he said. Up to the last he clung to his old habits, singing his own songs in a feeble broken voice, and playing meanwhile on the guitar. He has left behind him the fragrant memory of a long life, in which there was no sadness or baseness, but in which art and an affectionate nature were self-sufficient to the end.

EDMUND W. GOSSE.

LONDON IN 1772.—LEAVES FROM A MANUSCRIPT DIARY.

"Saturday, Aug. 15, 1772.—Walked to Charing Cross and visited the King's Mews, where one of the grooms showed me ten or a dozen of Hanoverian coach cattle of a light cream colour, and one of them thirty years old belonging to his late Majesty. The

present King took a fancy to ride one of these younger horses till he threw him, upon which the groom told me he was ordered to be shot; some nobleman, however, ordered his reprieve, since which time he is kept at full manger and looks as little criminal as his neighbours. The evening being very fair and serene tempted me to make an excursion to Marybone Gardens. But as there were no fireworks I did not go in, choosing rather to stroll about and amuse myself with the new buildings both here and near Oxford Road. Westminster and Middlesex are marching out of town as well as London. Such huge piles, such elegant improvements would most undoubtedly amaze you. They are joining field to field, and house to house in so unbounded and precipitate a manner that Hampstead will ere long be reckoned the suburbs of this city. I passed by Cavendish Square and came to New Ranelagh in Oxford Road. But night coming on I did not stop to view it, and so saved a crown till another opportunity.

"Monday, August 17.—Fatigued a little with yesterday's expedition, and conversing more with the dead than the living [in Westminster Abbey] I indulged myself this morning with a nap extraordinary. After dinner repaired to Foote's Theatre in the Haymarket, where this famous fellow Crutch played the parts of Smirk and Mr. Cole with equal justice and propriety. Both characters have been drawn from real life, but that of the old beldame is an uncommon one, which caricature itself has not much heightened. I was told by a very good judge that the original was taken from high life, one Mrs. Walker, a lady of great fortune, who indulged herself in all the excesses of luxury and vice. And when age and intemperance had damped all her powers and prevented her the indulgence of her own passions any longer, she set herself out as the keeper of a brothel where others, of her younger acquaintance, might gratify theirs; and then like a true swadler gives herself up to the conduct of Dr. Squintum whom she chose as her father confessor, indulging in the meantime the same strong inclinations to vice, and often consulting the spirit of enthusiasm and the brandy bottle for the good of her soul.

"I must confess I was not a little pleased to see this dapper manager strutting along the stage with so easy and smooth a gait, notwithstanding the providential judgment inflicted upon him for mimicking our friend George, who walks with a much stiffer knee, which might be rendered much more pliable had he applied to an ingenious artist here near Temple Bar that makes, as I am told, artificial legs and arms so fitted with springs and articulations as to perform in a great measure the functions of those that are natural.

"Tuesday, August 18.—In the evening I went to Marybone to amuse myself with the ingenious fireworks of Signor Torre. I can't say that they much excelled those exhibited at Ranelagh on the Prince of Wales's Birthday, either as to colour or composition of the fire, except in the wonderful representation of Mount Aetna. These gardens have been much improved since I saw them before. . . . The concert ended with a Buletta of La Serra de la Padrona, consisting of about a score of voices, male and female, to hear which we took our places in an amphitheatre; and brushed clothes with some stars and garters, Lord March, Lord Harrington, Count Orsini, &c.

"N.B. Burgundy is charged here at so moderate a price as half a guinea per bottle, champagne at eight shillings, Madeira at seven, and good old claret at six. All other drinkables as well as eatables in proportion.

"Thursday, August 20.—This morning I set apart for sauntering and designed in my way to the Park to call into the adjoining Coffee House, where I might make some enquiries about Burton Ale, a favourite liquor called English Burgundy, but was prevented by some company who came to breakfast. But being determined to know something about it, I found in the evening that the good old people were long since decamped, and a new host and hostess fixed in their room who could give me no information of it, only that they never sold it.

"Sunday, August 23.—Took a sculler from Hungerford Stairs which landed us at Blackfriars Bridge time enough for service in some of the city churches. The great officer of the pinnace in which we sailed told us that he ought to have a shilling for the set-down, as he himself forfeited five, if he were found plying of a Sunday since the bridge was finished. However we generously threw him a six-

pence to defray his expenses and called in at Blackfriars Church which was attended within and without; who came together to have the pleasure of hearing a young divine, in his own hair, very like Mr. Townsend, preaching without notes. But having had the felicity to hear the gentleman in Dublin, we stepped to St. Pauls, which was then shut up. Then to St. Augustine's hard by, from thence to Bow Church, from which we proceeded to St. Stephens, Walbrook, where we came time enough for service.

We had the pleasure of hearing Doctor Wilson, son of the late Bishop of Sodor and Man, who notwithstanding his great age of four score years preached with all the spirit and vigour of youth.

"After church we went on to reconnoitre the Mansion House which almost joins it. When we came up to the gate I perceived at a great distance three glimmering tapers giving a very obscure and dim sort of light to some dark passages below, for admission to which I rapped and rang the bell, and a spruce footman in very genteel livery with a silver shoulder knot immediately opened the door. I asked him whether we could see the house. "Aye, to be sure, by all means, Sir." I desired him then to conduct us to the lights at the farthest end of the vaults, which was no less than the kitchen grandly enough furnished to prepare a dinner for a prince or a king. When Alderman Harley was Lord Mayor he ordered the inscription which you may read over the mantle tree in Capital letters, *Spare not, waste not*—an excellent direction for genteel economy. In a large apartment near the kitchen were deposited three noble turtles alive, the largest of which the cook told us weighed 150 pounds. These are fattening, I presume, for some approaching feast, and live mostly on the inwards of fowls, but will eat beef or mutton upon a pinch.

"Monday, August 24.—This morning I designed going to Blackheath where his majesty received some regiments accompanied by their Royal Highnesses the Duke of Gloucester, Prince of Wales and Bishop of Osnaburgh. But it turning out a rainy day I chose rather to stay at home till the evening, when I repaired to Foote's Theatre in the Haymarket, where he was to make his appearance in the character of Bayes for the benefit of Mr. T. Jewel. However, finding the house chuck full I went down to Pinchbeck's, where I made some enquiries about the Repository exhibited there, which they told me was never shown but in winter, when the greatest concourse of nobility and gentry were in town. In the summer the machinery is taken to pieces and laid by like Mr. Croker King's company of Comedians, till refitted with new wires by which Punchinello and Lady Joan are once more qualified to divert even a vice-roy.

"Tuesday, August 25.—Sitting up last night pretty late I was not much disposed this morning to go in search of new adventures, and therefore chose to entertain my friends with reading several passages of my journal, with which they were pleased to be very merry. After which I walked along Oxford Road as far as Tyburn. Many new buildings have been erected here since I was last in town. But I missed seeing a small portable triangular holding, which has been famed time out of mind for a succession of numberless tenants, who, though tenants for life, the moment the writings are drawn and they put in possession by the high sheriff of the county they find themselves suffocated upon the spot with a strange sort of 'equinaney,' upon which they immediately kick up their heels and expire.

"Wednesday, August 26.—Took a trip this morning through Leicester Fields to Covent Garden in search of Princess stuff which I saw very much in fashion at Oxford for gowns and cassocks. . . . From hence I marched to the street or the quay called the Adelphi, where formerly Durham Yard was placed. This, though vested in the Crown, has been lately granted by the influence of Lords Bute and Mansfield to one Adams a Scotchman and a mere creature of their own, under the specious cloak of whose name as architect a noble group of buildings these four or five years past has been carrying both above and below ground fit to entertain princes.

"Thursday, August 27.—I ought to have told you that yesterday evening, being very fine, tempted us to walk through the fields to the Farthing Pie House famous for cakes and ale, and the amusement of some small gentry who frequent it to play nine-pins and skittles. We found at least fifty people happily em-

played on this occasion, each of them as happy as a king, and many of them as despot and arbitrary, having long pipes in their mouths, and always smoking their own tobacco, how offensive soever it may be to the olfactory nerves of their neighbours. We diverted ourselves here with the oddity of the humour for some time, paid for our entertainment, returned through Red Lion Square, and came home.

"Saturday, August 29.—The goodness of the morning induced me to exercise my limbs somewhat earlier than usual. I made the best of my way to Hyde Park, and walked almost as far as Kensington. I saw here a great many herds of deer a browsing near a new guard room lately built in the park. I took my tour along the Pond, till I arrived at another piece of water over which at some distance two small arches are thrown for the more convenient passage in winter to the palace and Knightsbridge. From hence there is a very extensive prospect of a rich level country as far as your eye can carry you on the Southern side of the river. Coming out of the park on the left hand near Piccadilly, I perceived a new pile of buildings carrying on for Lord Chancellor Bathurst, upon a plot of ground purchased from Lord Hyde at 4,000*l*. From hence there is a passage on the opposite side of the road into the Green Park, of which Captain Shirley is keeper. This affording me a pleasant walk, I came out at the lodge and stepped into Mr. Chare's yard, which, on account of numberless figures in stone, lead, and plaster, you would swear was a country fair or market made up of spruce squires, haymakers with rakes in their hands, shepherds and shepherdesses, bagpipers and pipers and fiddlers, Dutch skippers and English sailors enough to supply a first rate man-of-war. I saw here a bust much resembling a picture of Tristram Shandy drawn by Sir Joshua Reynolds, which I had seen in his painting gallery at Leicester Fields. One of Chare's men told me that Mrs. Sterne abused his master a good deal for pirating her husband's bust, who said 'was not done by him, but sent by some gentleman.

"Monday, August 31.—Having a great curiosity to see Mr Foote in the character of Bayes, I repaired to his theatre in the Haymarket this evening. 'Tis a part exceedingly well adapted to his cast of humour, and I must confess he did it the utmost justice. The play itself, called the Rehearsal, was designed by the noble author who wrote it as a keen lampoon and satire upon the extravagancies of the poets who lived at that time, and particularly Dryden. They were all taken off in caricature, and the player has added many pleasing anecdotes of his own, relative to some late disputes between court and city. The play closed with a farce and a dance by half a score little actors and actresses in the characters of haymakers, the eldest seeming not above twelve years of age, who not only mimicked, but far excelled your grown-up gentry in every step, cut and flourish, both for the quickness of the movement, and elegance of the figure.

"Tuesday, September 1.—As the Doctor was determined to go into the city this morning and call at the Bank of England for his dividend in the funds, he was in a great bustle to find out his transfer ticket which had been misplaced, and though he had searched through all his papers contained in the drawers of his bureaux and desks, yet did he search in vain. However, being obliged to count without our host, we proceeded with such description as we had, and depended chiefly on consulting the books themselves where every man's stock is fairly entered. And indeed we had time enough to set ourselves right in that particular; for 'tis fixed as an invariable rule here that the persons who do not attend here precisely at eleven o'clock must of course wait till one. The first hour being passed we had sufficient leisure to survey the building. . . . When we cleared out hence I repaired immediately to Guildhall, and introduced myself to my old worthy acquaintances—the inseparable pair of Lilliputians that constantly mount guard on each side of the clock. But they did not take the least notice of me by a single shake of a battle-axe, quiver or bow. Rather indeed looked down upon me with knitted brows and stern countenances over threatening at a monstrous rate. This contempt might be imputed to their being the direct descendants of Og, King of Bashan, or some other illustrious of giants; or perhaps to their regimentals newly vamp'd. But 'tis more than probable they don't pride themselves much in dress, as it can be proved they have not left another suit in the wardrobe.

The very same habiliments with which they are invested now, and which are not one farthing the worse for the wearing, have without the least change distinguished them from generation to generation. . . .

"Wednesday September 2.—Disengaged this morning from any material business, I stretched my legs with an easy walk to Cavendish Square, where a glittering object fire-new almost struck my eye with an agreeable surprise, which was the equestrian statue of his royal highness late Duke of Cumberland in full proportion mounted upon a high mettall'd and fiery steed. This was erected at the sole expense of General Strobe who was lately tried by a court martial for compelling his soldiers to cut their coats according to the cloth allowed them. And yet though honourably acquitted he thought it his duty here to return the corps more than weight for weight, and like an old Grecian captain that Homer mentions, exchange brass for gold.

"Saturday, Sept. 5.—. . . I walked up Oxford Road and turned aside to view some new buildings that are carrying on through Portmans Square. There are but three sides of it yet completed, and one house only of the fourth, from which you have a prospect of 'Marybone' Gardens, Hampstead and Highgate. The centre of it is fenced in in the form of an amphitheatre and has four sentry boxes of cut stone as so many entrances."

CORRESPONDENCE.

THE VEDAS AND THE BRAHMO SOMAJ.

I was aware of the mission of the four young Brahmins sent to Benares in 1845, to copy out and study the four Vedas respectively. I had read of it last in the *Historical Sketch of the Brahma Somaj*, which Miss Collet had the kindness to send me. But what I said in my address before the Oriental Congress referred to earlier times. That mission in 1845 was, in fact, the last result of much previous discussion, which gradually weakened and destroyed in the mind of Ram Mohun Roy and his followers their traditional faith in the Divine origin of the Vedas. At first Ram Mohun Roy met the arguments of his English friends by simply saying, If you claim a Divine origin for your sacred books, so do we; and when he was pressed by the argument derived from internal evidence, he appealed to a few hymns, such as the Gâyatri, and to the Upanishads, as by no means inferior to passages in the Bible, and not unworthy of a divine author. The Veda with him was chiefly the Upanishads, and he had hardly any knowledge of the hymns of the Rig-Veda. I state this on the authority of a conversation that passed between him and young Rosen, who was then working at the MSS. of the Rig-veda-sanhita in the British Museum, and to whom Ram Mohun Roy expressed his regret at not being able to read his own sacred books.

There were other channels, too, through which, after Ram Mohun Roy's death in 1833, a knowledge of the studies of European scholars may have reached the still hesitating reformers of the Brahma Sabhâ. Dvarka Nâth Tagore paid a visit to Europe in the year 1845. I write from memory. Though not a man of deep religious feelings, he was an enlightened and shrewd observer of all that passed before his eyes. He was not a Sanskrit scholar; and I well recollect, when we paid a visit together to Eugène Burnouf, Dvarka Nâth Tagore putting his dark delicate hand on one side of Burnouf's edition of the *Bhagavat Purâna*, containing the French translation, and saying he could understand that, but not the Sanskrit original on the opposite page. I saw him frequently at Paris, where I was then engaged in collecting materials for a complete edition of the Vedas and the commentary of Sâyana Akârya. Many a morning did I pass in his rooms, smoking, accompanying him on the pianoforte, and discussing questions in which we took a common interest. I remember one morning, after he had been singing some Italian, French, and German music, I asked him to sing an Indian song. He declined at first, saying that he knew I should not like it; but at last he yielded, and sang, not one of the modern Persian songs, which commonly go by the name of Indian, but a genuine native piece of music. I listened quietly, but when it was over, I told him that it seemed strange to me, how one who could appreciate Italian and German music could find any pleasure in what sounded to me like mere noise, without melody, rhythm, or harmony. "Oh," he said, "that is exactly like you Europeans! When I first heard your Italian and German music I disliked it: it was no music to me at all. But I persevered, I became accustomed to it, I found out what was good in it, and now I am able to enjoy it. But you despise whatever is strange to you, whether in music, or philosophy, or religion; you will not listen and learn, and we shall understand you much sooner than you will understand us."

In our conversations on the Vedas he never, as far as I recollect, defended the divine origin of his own sacred writings in the abstract, but he displayed great casuistic cleverness in maintaining that every argument that had ever been adduced in support of a supernatural origin of the Bible could be used with equal force in favour of a divine authorship of the Veda. His own ideas of the Veda were chiefly derived from the Upanishads, and he frequently assured me that there was much

more of Vedic literature in India than we imagined. This Dvarka Náth Tagore was the father of Debendra Náth Tagore, the true founder of the Brahmo Samáj, who, in 1845, sent four young Brahmans to Benares to copy out and study the four Vedas. Though Dvarka Náth Tagore was so far orthodox that he maintained a number of Brahmans, yet it was he also who continued the grant for the support of the Church, founded at Calcutta by Ram Mohun Roy. One letter written by Dvarka Náth Tagore from Paris to Calcutta in 1845, would supply the missing link between what was passing at that time in a room of an hotel on the Place Vendôme, and the resolution taken at Calcutta to find out, once for all, what the Vedas really are.

In India itself the idea of a critical and historical study of the Veda originated certainly with English scholars. Dr. Mill once showed me the first attempt at printing the sacred Gâyatri in Calcutta; and, if I am not mistaken, he added that unfortunately the gentleman who had printed it died soon after, thus confirming the prophecies of the Brahmans that such a sacrilege would not remain unavenged by the gods. Dr. Mill, Stevenson, Wilson, and others were the first to show to the educated natives in India that the Upanishads belonged to a later age than the hymns of the Rig-Veda, and likewise the first to exhibit to Ram Mohun Roy and his friends the real character of these ancient hymns. On a mind like Ram Mohun Roy's the effect was probably much more immediate than on his followers', so that it took several years before they decided on sending their commissioners to Benares to report on the Veda and its real character. Yet that mission was, I believe, the result of a slow process of attrition produced by the contact between native and European minds, and as such I wished to present it in my address at the Oriental Congress.

MAX MÜLLER.

SHAKSPERE "ALLUSION BOOKS."

4A, Victoria Road, Clapham, S.W.

I am sorry to have to criticise the first instalment of the "Allusion-books" of the New Shakspeare Society, especially as it might seem a retaliation on Dr. Ingleby for his criticisms on me in his introduction to the book. I can only say, that this consideration is my only difficulty in sending you this letter.

In the sixth head of his introduction, Dr. Ingleby says that he reprints Gabriel Harvey's third letter, partly "from his supposed allusions to Shakspeare, viz., 'the worst of the four,' and 'one whom I salute with a hundred blessings;'" and afterwards he explains the meaning of Harvey's wish that Greene's honesty or learning may be half as much as that of the worst or least learned of the four. "That is half as honest as Shakspeare, or half as learned as Nash; the four being, as we have seen, Marlowe, Peel, Nash, and Shakspeare." Then on another sentence Dr. Ingleby remarks, "This clearly alludes to Greene's attack on the *Shakescene*."

This is a pardonable oversight of Dr. Ingleby, who errs *cum Platone*, or rather with a multitude. Harvey in his third letter is referring to Greene's *Quip for an Upstart Courtier* (see p. 129, l. 15), and to no other of Greene's books, for he wishes us to infer that he has seen no others: "If his other books be as wholesome gear as this" (p. 130, l. 10). He is only referring to the *Quip*; and in the *Quip* the four persons abused were Harvey the father, and his three sons Gabriel, Richard, and John. And this abuse was the chief cause of Harvey's writing the letter—"partly the vehement importunity of some affectionate friends, and partly mine own tender regard of my father's and my brothers' good reputation have so forcibly overruled me" (p. 124, l. 12). The abuse of these parties is thus described by Harvey:—

"The best is, the persons abused are not altogether

unknown, they have not so evil a neighbour that ever read or heard those opprobrious villanies (it is too mild a name for my brother Richard's most abominable legend, who frameth himself to live as chastely as the lewd writer affected to live beastly) but hath presently broken out into some such earnest or more passionate speeches: 'O pestilent knavery, who ever heard such arrant forgeries and rank lies.'"

This legend of Richard Harvey is not, and never was, in *Greenes Groatworth of Wit*. Neither is it now in the *Quip*. But it was, as Dyce abundantly proves, in the first impression, which Green was urged by his physician to alter. For the whole proof of this I refer to Dyce's "Account of R. Greene and his Writings," prefixed to his edition of Greene's Dramatic Works.

The four persons referred to are Harvey senior and his three sons. The worst of them, let us hope for modesty's sake, is Gabriel; the unlearnedst must be the ropemaker himself, Harvey the father. There is no allusion here to the *Groatworth of Wit*; nor is there in the next sentence, "Thank other for thy borrowed and filched plumes of some little Italianated bravery; and what remaineth but flat impudency and gross detraction?" Harvey guessed rightly that the *Quip* was a mere plagiarism; but he evidently did not know Thynne's poem, or he would triumphantly have exposed the theft, instead of merely surmising and asserting it.

As for the other "allusion" to Shakspeare, "whom I salute with a hundred blessings," Dr. Ingleby, I am afraid, has been misled by fanciful biographers who never read Nash's reply to Harvey in *Strange News*, sig. L 2:—

"To make me a small seeming amends for the injuries thou hast done me, thou reckonest me up amongst the dear loves and professed sons of the muses. Edmund Spenser, A. Fraunce, T. Watson, S. Daniel. With a hundred blessings and many prayers thou intreatest me to love thee.

"Content thyself, I will not."

It would be absurd to deny that here Nash refers to Harvey's third letter (p. 148), and appropriates the supposed Shaksperian allusion to himself. He is manifestly right. There is no allusion whatever to Shakspeare in this letter, which should be omitted from all future lists of "allusion-books," except so far as relating to Greene and Nash.

While I am writing on this matter, will you allow me to correct a note to a communication of my own, which Dr. Ingleby has printed at the end of his Introduction, p. xlvii. I referred (from memory) to a book of Sir Edwin Sandys. It should have been to *A Collection of Letters made by Sir Tobie Matthews Knight*; London: Herringman, 1660. At p. 100 is a letter, "one friend to another on the miscarriage of a letter." The writer describes what the lost sheet contained, and adds:—

"For I must tell you I never dealt so freely with you in any; and (as that excellent author Sir John Falstaff says) what for your business, news, device, foolery, and liberty, 'I never dealt better since I was a man.'"

I think that some of these letters were written about 1600. They are undated and generally without names.

Once more, in giving the indications of a rivalry between Shakspeare and Marlowe in 1592-93 (Introduction, p. xlvii.), I should have added Shakspeare's 86th Sonnet, which, as Mr. Massey shows, refers to some such relation. Marlowe perhaps, like Shakspeare, intended to dedicate his poem to Southampton. Son. 80:—

"O how I faint when I of you do write
Knowing a better spirit doth use your name;"
and Son. 86:—

"Was it his spirit, by spirits taught to write
Above a mortal pitch, that struck me dead?
No, neither he, nor his compeers by night
Giving him aid, my verse astonished.
He, nor that affable familiar ghost
Which nightly galls him with intelligence
As victors of my silence cannot boast."

Mr. Massey with great probability argues that Shakspeare here alludes to Marlowe under the mask of Faustus, with Mephistopheles his familiar.

After what I have said I need scarcely add that although I am a member of the Committee of the New Shakspeare Society, I had no part in the reprint of Harvey's letter. If I had known his intention, I would have shown the editor its irrelevancy. But the letter is very interesting on other accounts, and it is good to reprint it, except so far as any such partial reprint stands in the way of future complete editions of Harvey, Nash, Greene, or Lodge.

RICHARD SIMPSON.

SCIENCE.

History of Philosophy from Thales to the Present Time. By Dr. Friedrich Ueberweg. Translated by Geo. S. Morris, A.M., Professor of Modern Languages in the University of Michigan. Vol. II., "History of Modern Philosophy." (London: Hodder & Stoughton, 1874.)

THE name of Ueberweg is now in this country, as well as in his own, the guarantee of acute and extensive research in the various periods and branches of philosophy; and the history, of which the present volume is a part, is not the least useful, able, and elaborate of his works. He had on one hand made himself master of a store of knowledge in history and in general science such as few have attained; and on the other hand, he wrote in a style which, though far from forcible or graceful, is still distinctly precise and intelligible. He had much of that definiteness and sobriety of mind, and much of that critical balance, which to an English reader seem absent from many German speculations. The aureole round great names did not daunt his freedom of judgment. To the "holy" in the philosopher he brought an "offering of ringlets," but to the paralogisms dissecting criticism, and thus each received its due (p. 64). The historical survey of successive systems he prosecuted with a fixed conception of what philosophy could accomplish, and a settled opinion on all the great and all the little questions of historical inquiry. His history is learned and critical to a high degree. Its usefulness to any one who wishes to carry his studies deeper is increased by a very complete bibliography, not merely of the philosophers themselves, but of all and sundry who have written about them, whether their contributions extend to volumes, or do not pass beyond a single page of a magazine. As a repertory or encyclopaedia of philosophical history, it will be welcome to the large class who wish to have at hand the latest and most accurate information on the opinions, books, and biography of philosophers; and it will be equally serviceable to the increasing multitude who have to "cram" such matters to meet the requirements of examiners. In exhaustiveness and comparative fairness of statement, it is probably superior to any manual on the same subject accessible in the English language. It should be added that the translator, Professor Morris, of Michigan, has done his work faithfully; and has given, over and above an accurate rendering of the original, some further information deemed necessary for an English reader.

Of course the book is one to be used like a dictionary, more than to be read in the ordinary way. It is a thing of shreds and patches of opinions, theories, and criticism: with dates, names, and ideas tabulated in admirable order and bareness. Plenty of facts, and analyses of the more important works are its *forte*. It is the very dry bones of history. A greater contrast can scarcely be imagined than between it and Erdmann's history of the same theme. But perhaps it is on that account not less suited to its purpose.

There is, however, a limit to the advantages of a critical history of philosophy. In a way we must always try to read the past by the light of the present; and interpret or criticise others by ourselves. But when the present and ourselves become not the means of examination, but the standard of judgment, it is not likely that the interpretation will be fair, or the judgment true. There are at least two different dangers in the process of historical criticism. One danger is to transform in our construction the language and thoughts of an earlier time into the systematic phraseology of a later time; to raise one order or level of categories into another and a more complex. This is a mistake often committed in dealing with Greek philosophy, or with the vaguely-known ideas of early times. The other danger is to apply the principles and methods of matured reasoning and science to criticise and correct the defects of theories and ideas belonging to an earlier period. In the former case the tendency is to exaggerate the similarities of thought which exist between different epochs. In the latter case the tendency is to exaggerate shortcomings, and to take the past at its worst. The ideas are tried by a standard which is outside of them, and, therefore, not strictly relevant; and they naturally suffer by the comparison. This is the fault which seems to beset the method and practice of Ueberweg, whilst he has pretty well avoided the other. He is apt to sink into the controversial tone, descending into the battle-field with all the weapons of modern logic, and hitting hard at the paralogisms and failures of his subjects: apparently with a desire for edification, and a fear that the mind of susceptible learners may be led astray by specious fallacies, or fail to reach the results of later thought. It may be right in a systematic exposition of philosophical theory to point out how far other doctrines square with it. But the right is less clear when the statement of a philosopher's views is made an occasion for riddling them in their unprotected brevity with the mitrailleuses of modern criticism. An abstract, *e.g.* of Spinoza, is put forward by Ueberweg only to be the object of an unintermittent series of foot-notes, which argue from various presuppositions of the historian's own philosophy that the views in the text are erroneous. One leaves off reading with a strong impression that every philosopher has been very much in the wrong, and that the critic himself possesses, if only he would reveal it, the secret of all truth. But if the history of philosophy is worth studying at all, the student must allow himself to be saturated with the whole mind and theory of a philosopher, and not be im-

patient with every feature that controverts his personal creed or some established doctrine. These remarks, however, affect the study of such history more than the compiler; and perhaps a compendium is expected to furnish antidote as well as poison, in case complaints should arise.

The value of the translation has been increased by two appendices: one on the history of English and American philosophy, by Dr. Noah Porter, of Yale College; and another, doing the same thing for Italy, by Vincenzo Botta. This is a direction in which more useful work can be done than in general histories, which include the most heterogeneous materials under a common name. The latter certainly can never be dispensed with; but for some time they have rather overlooked and concealed all special lines of differentiation. Yet from some points of view the differences between what is called philosophy by various minds and among various peoples rise into vast amount. English philosophy has been in the main a very insular production, and has a current and history of its own. Locke, who is commonly regarded as its founder, is considered by many to have worked his way so thoroughly through the nature and origin of ideas, that he penetrated to the Antipodes, and began quite a new order of enquiries. English thinkers have certainly never tried to return to the region he left, but have given themselves mainly, if not entirely, to the study of mental states. They have the honour of discovering the human mind: and of late years have been trying to construct it. To continental philosophy they have paid little or no attention—and perhaps for many reasons wisely. The questions of English philosophy, the terminology, and the range of inquiry, are quite of a kind of their own. It is high time that the influence of nationality should be recognised in such a sphere: and this is especially the case with English philosophy. To understand the bases of J. S. Mill we must go mainly, and almost solely, to Locke and to Hobbes on Computation. Occasionally, it is true, influences from foreign thought have made themselves felt: and it is also true that the works of Locke, Hume, and Reid have told powerfully in accelerating or directing development in France, Italy, and Germany. But these very influences have to pass through the medium of the national idiosyncrasy in order to operate. The fact of nationality is one most important variable in that function of human reason, termed philosophy. The rise of such national philosophies is perhaps the most distinctive feature of the modern world as distinguished from the middle ages. It is only in Scholasticism when a certain unity of empire and belief, partly fictitious and partly formal, prevailed, that European philosophy can be looked upon even approximately as a single continuous series. And even there further knowledge only tends to dissipate such a belief in absolute uniformity. It is scarcely enough noticed that one of the last great names of Scholasticism shows the dawn of modern divisions. William Occam is the spiritual precursor of Hobbes, Locke, and Mill. The same contempt for abstractions—denying that a relation is anything but

things related, the same opposition against ecclesiastical absurdities, the same view that a science of theology is a dream—appears in him as in them.

Dr. Porter has given a fair account of some of the chief names and minor satellites in this sphere: and his remarks are generally sensible and pithy. A note on Mr. Herbert Spencer even tries to be facetious. American philosophy is shortly narrated. It is in the main an expansion of some currents of British thought, notably Reid and Stewart: but in modern times nearly all the national schools of European speculation have found expositors or adherents on the western continent.

It is difficult to speak as favourably of the account given of Italian philosophy. The subject is so little known out of Italy, and the terminology of the Italian thinkers so characteristic, that a brief statement tends to mystify the reader. And yet enough has been said to show that the topic is an interesting one. Several of the approved Italian systems are only adaptations of ideas more appropriate to Germany or England or France. But there are two other sets of thinkers more characteristic of Italy. The one is the scholastic or theological, which continues to comment on the doctrine of Aquinas as the last utterances of wisdom. The other category includes what may be roughly termed idealists of several orders of idealism, and of this the most noted names are Rosmini, Gioberti, and Mamiani. These thinkers are the heirs of Dante, of Bruno, and of Vico. Their names are closely connected with the political resurrection of their country. Rosmini, a priest and founder of a religious order, connects them with the Church, and with the Catholic liberals who sought to reform social life from an ecclesiastical basis; while Gioberti and Mamiani, especially the former, are more associated with the national emancipation which Cavour accomplished. Regarded as metaphysics (after the German style), or as mental science (after the English), their philosophies would not count for much; but as the best expression of national aims and ideas they have an interest of their own. From the days of Pythagoras and Parmenides the soil of Italy has been the home of men who have exhibited the political, the philosophic, the poetical, and the religious faculty in closer union than can perhaps be found in any other country.

The subject of the present volume is modern philosophy. But to define it as philosophy since it has ceased to be subservient to theology is scarcely sufficient. There was much of this emancipation in the scholastic period. The Archbishop of Paris, who condemned the people that taught "*quod sermones theologici sunt fundati in fabulis*," lets us know that Averroism and other untamed species of speculation had their representatives in the very zenith of scholasticism. And in modern times it has been only in formal logic and on the surface of psychology that theology has been kept at bay. In some notable systems the theological presupposition has given the key-note to the whole. And where this has not been distinctly the case, the problems of theology have often

stood in the background of motives. As Ueberweg says (p. 136):—

"The innermost soul of the whole process of development in modern philosophy is not a mere immanent dialectic of speculative principles, but is rather the struggle between religious convictions (handed down from the past and deeply rooted in the modern mind and heart), and the scientific results of modern investigations in the fields of nature and mind."

W. WALLACE.

The Works of Horace, with a Commentary. By E. C. Wickham, M.A., Master of Wellington College, and Fellow of New College, Oxford. Vol. I. The Odes, Carmen Seculare, and Epodes. (Oxford: The Clarendon Press, 1874.)

The Odes of Horace in a Metrical Paraphrase. By R. M. Hovenden, B.A., formerly of Trinity College, Cambridge. (London: Macmillan & Co., 1874.)

MR. WICKHAM in his preface disowns any high claims to originality as a commentator on Horace, and in one department this is true of his edition, as indeed of most English editions. It is very difficult to add anything new in the way of illustrative quotations, so vast is the already accumulated store. But in another sense it would be most unfair to say that the last, and perhaps the best, of English commentaries is deficient in originality; in the attempt, sometimes overstrained, perhaps, but in the main successful, to trace the often obscure connexion of thought in the Odes. As he himself says, it is not too much to expect that we should be able to detect the threads which bind into their unities lyrics so consciously and elaborately artistic as those of Horace. Yet how far from easy the task actually is, any one will see who reads them in a translation; or, in another way, by the discrepancy of the explanations. Mr. Wickham's prolonged study of the Odes, his refinement of feeling, good sense, and accuracy, give him a right here to be listened to attentively; wildness or eccentricity he is as far removed from as Horace himself. The brief abstracts affixed to each ode are good, though perhaps hardly as useful as Maclean's; the translations are most careful, obviously studied, sometimes perhaps a little too decidedly reflecting the peculiarities of Mr. Wickham's chief master and dear friend, the late Professor Conington; yet reflecting much more of his merits than his defects. No one who had studied at Oxford whilst Conington was teaching there, failed to be influenced to some extent by his example, and this was especially true of his style in translating, which, effective as it was when listened to in a public lecture, was often over-elaborated and even displeasing to the more sober and critical judgment of a reader. Many, we think, who heard him declaim his prose translation of Virgil in St. Mary's or the hall of Corpus Christi, must have been surprised to find themselves disappointed when reading it quietly afterwards; it aims so high as often to miss the mark; yet it produced, if we may use the expression, a school, as every classical moderator and every tutor can testify. Mr. Wickham, who dedicates his edition to the memory of Conington, acknowledges

this influence: it is indeed perceptible throughout; nay, what weaknesses are to be found in this Horace are weaknesses of the Coningtonian kind; but then the Coningtonian excellences are exhibited in a very much larger proportion, and largely contribute to make the book what it is. As a specimen of what we mean we may take the note on II. iv. 7, *Arsit Atrides medio in triumpho Virgine rapta*, where Mr. Wickham, comparing Epod. xiv. 13, finds a play of meanings, "He was fired by her as he had fired Troy"—which is surely fanciful; and the translation of 13, *Nescias an te generum beati Phyllidis flavae decorant parentes*, "Possibly, though you know it not, auburn Phyllis has parents among the great, a wreath of glory to you their son-in-law," where surely no idea of actual decorations presented itself to the mind of the poet. So the note on II. xvi. 6, *Otium Medi pharetra decori*, "their very adornment belies their prayer," is infelicitous; it suggests that Horace had a definite purpose in the last two words, and that they are more than ornamental epithets; so far every scholar of this generation would probably agree with Mr. Wickham; but if the explanation is right, we should naturally go on to interpret the gems purple and gold which Horace tells us will not buy repose, as referring to the Thracians and Medes, and our next enquiry will be which of the three does not belong to the Medes and may therefore be presumed to describe the Thracians. Or take the note on III. vi. 44, "Horace probably felt some slight pleasure in the paradoxical form of *agens abeunte curru*;" which seems to mean that a contrast between the departure of the sun's chariot with the approach of the hour of pleasure was intended: which is more than doubtful. We are not at all inclined to combat the general truth of the position that no single word in Horace's Odes is otiose, and it is the most signal feature of the present edition that it rigidly enforces this. Mr. Wickham is never tired of pointing out the antitheses of word and thought which, at times scarcely observable, exist throughout; but these are often only faint suggestions, and if touched at all must be touched lightly and with the most delicate hand; more delicate, we think, than Mr. Wickham, in spite of great refinement, can at all times succeed in attaining. This is perhaps hyper-criticism; but, as we said above, it is in this sphere that the editor claims for himself most originality, and where his strength, as compared with other editors, will most be tested. Lovers of Horace will indeed feel thankful to one who has spent so much trouble in pointing out what it is that makes their favourite so permanently charming; e.g., the overlapping of similes, see the excellent note on I. xxxvi. 18–20 *nec Damalis novo Divelletur adultero, Lascivis hederis ambitiosior*; the lively direct question and direct answer which makes a kind of lyrical dialogue of I. 27; the unsuspected oxymorons, see on I. xxxiii. 2, the close relation of words removed by some distance from each other, e.g. III. ix. 26, *inane* with *pereuntis*; the significance of what at first seems a mere date, e.g. *consule Planco*, which was not only the time of Horace's youth, but of Philippi, when the republic, like the poet

himself, was not prepared to submit without a battle; the thoroughly Roman *allusiveness* of the language, e.g. to *tripudiare* in III. 18, 16, to military operations in III. 28, 4.

He will be grateful also for the careful treatment of grammatical questions, though he will perhaps dissent at times from the explanation, e.g. of the ablatives, *Diceris Vario... Maenii carminis alite... curatus inaequali tonsore*, which Mr. Wickham considers parallel with the ablatives *Cecropio repetes colthurno, Delmatico peperit triumpho, Unda fretis tulit aestuosis*, and explains as various developments of the ablative absolute. It seems at least as probable that the two first are mere extensions of the instrumental ablative; and surely it is not true that either *Cecropio* or *Delmatico* is predicative, that Pollio has a lofty calling because the buskin is Attic, or that his honours are eternal because the triumph was over the Delmatae. Nor can we say that any great new light has been thrown upon Horace's frequent use of the complementary infinitive like *laborat trepidare, indocilis pati*, &c., though it is useful to have these congregated in an appendix, (pp. 377–381). And is it not even erroneous to call *Filius Maiae*, I. 2. 33, a nominative for a vocative? Certainly the obvious translation is, "or whether thou art the son of Maia that hast changed thy form to wear the youth's semblance:" at any rate it is not like *Vos o Pompilius sanguis*, A. P. 292. We object too to translating *aget* in II. 2. 7, "upbear," *rapidum solem*, in II. 9, 12, "the striding sun," against its ordinary meaning in this combination, "scorching;" to *Sabinis*, "my Sabine farm," instead of "my Sabines," II. 18. 14; nor can we see why in *Tradidit fessis leviora tolli Pergama Graiis*, Mr. Wickham translates *fessis* "even in their weariness," or accept, even on the authority of Bentley, so perverse an explanation of *Notaque et artium Gratarum facies*, IV. xiii. 21, as that which takes *artium gr.* as dependent on *notae*, in absolute defiance of the natural sense of *et*; nor can we think that *bene* could mean wisely in *bene mutuis Fidum pectus amoribus*, or that *Glyceræ decora aedes* could be Glycera's house regarded as a temple. Occasionally, too, we think notes are given unnecessarily, as on *Atqui*, I. xxxiii. 9; on the other hand the notes on the Epodes are unduly short. Once the editor is mistaken in a fact, p. 67; the 34th poem of Catullus is not called *Carmen Seculare* in any MS. known to the present writer; once or twice references are omitted which ought to find a place, e.g. the remarkable passage of Aratus, which seems to have suggested the end of III. 6, Phaen. 123, οἶνον χροσεῖσι πατέρες γενέην ἐδίποντο Χειροτέρην, ὑμεῖς δὲ κακώτερα τεύξεσθε.

In orthography, the text of Orelli is adopted as a standard, which in these days can hardly be thought satisfactory; *thuris herum* against the better MSS. ought not to be retained; on the other hand, it seems doubtful whether Horace wrote *Miserarumst*, and we agree with Mr. Wickham in thinking it unsafe to follow on this point an arbitrary rule, which certainly cannot be proved by MSS. or inscriptions. We must not omit to mention as a signal addition to the value of the book, Mr. A. O. Prickard's careful collation of the Queen's College MS.

There are a good many misprints, of which we have noticed the following: *unda* for *undae*, p. 156; *Horae* for *Horace*, p. 164; *Acroceraunian* for *Acroceraunian*, p. 197.

Of Mr. Hovenden's Translation of the Odes, we have not space to say much. It is a great deal better than many others; but it is not as good as the best. Its faults are generally not those of carelessness, but of insufficient command of language; and this is perceptible even where it is most successful. A great deal might be done to improve it, we think, by alteration of single words or single lines. A fair specimen is IV. 30, which with very slight changes in vv. 7, 8, and 10 would be as good as most versions of this Ode.

"More durable than bronze, and more sublime

Than royal Pyramids, I build a fine
Impervious to storms of wind and rain,

And proof against the ravages of time.

Some part of me, undying, shall abide,

And voices yet unborn my name extol

Whenever Pontiff mounts the Capitol

With silent vestal-virgin at his side.

When Ausidus in tumult rolls along

In rough ill-natur'd lands where Daunus reign'd,

I, lowly-born, shall win the foremost praise

For wedding Roman verse to Grecian song;

Uphold me in a rank by merit gain'd,

And wreath my hair, Melpomene, with bays."

R. ELLIS.

Universities Commission Report. Vol. I.

THIS volume, which has been so long and so anxiously expected, contains not only the report of the Commissioners, but also abstracts and synoptical tables, prepared under their direction, which exhibit in a concise and intelligible form the details of the financial position of the two universities and their several colleges. The actual returns which were made by the university and college officials are reserved for another volume, which apparently is already in the printer's hands; but the present volume contains sufficient information for all ordinary purposes of inquiry. To avoid disappointment, it is important to recollect that the scope of this Royal Commission was limited to one definite object, viz.:—

"To enquire into the property and income belonging to, administered, or enjoyed by the Universities of Oxford and Cambridge, and the colleges and halls therein (whether held or received for their corporate use, or in trust, or in whatsoever other manner), including the prospects of increase or decrease in such property or income; and to report the uses to which such property or income are applied, together with all matters of fact tending to exhibit the state and circumstances of the same."

Within these limitations the Commissioners have rigidly confined themselves; they have not attempted to make recommendations of their own, nor have even analysed the educational expenditure of the colleges under the heads of theology, classics, mathematics, and science, though such an analysis might without violence have been included within the words of their mandate, nor have they afforded to the public the opportunity of making such an analysis for themselves. The real value, however, of the financial statements which they have obtained, may be learned from the circumstance recorded in Mr. Gladstone's letter to the Vice-Chancellors, here reprinted, that the Royal Commissioners of twenty years ago were unable to obtain any trustworthy information on these subjects. For the first time then in the history of these ancient institutions, their whole accounts are now fairly published, and the nation can learn the precise amount of the endowments which it permits to be devoted to academical purposes.

The Commissioners had no compulsory powers of obtaining answers to their enquiries, but it is gratifying to learn that, with the one exception of

Sidney Sussex College, Cambridge, they have always "received the ready assistance of the college bursars, and have been met with a spirit of marked courtesy." The report proper, which only consists of some fifteen pages, gives a summary of the entire income and expenditure at Oxford and Cambridge, and a short description of the sources from which the revenue is derived, and concludes with some remarks upon the management of the landed estates and the method in which the accounts are kept. The bursarial system is thus incidentally brought under review, and on the whole emerges well from the close scrutiny which it undergoes. The cost of management of the estates is put at the "remarkably low" average rate of 2l. 15s. 10d. per cent., to which must be added the salary of the financial officers, which is in some cases nothing at all, and in no case large; and with reference to the estates let at rack rent, the Commissioners state that "they have no reason to think that they are below the average as regards buildings, drainage, and cottages;" and further on, that "the average lettings, the absence of arrears, and the apparently small amount of the losses from tenants, testify to the care and vigilance of the bursars." As to the estates let on beneficial leases, a mode of letting which still unduly predominates at many of the wealthier colleges, the best that can be said about them is that they are rapidly falling in, and being improved, and then leased at rack rent, a process which requires temporary loans to a large amount, and considerable self-sacrifice on the part of the fellows during the time. Attention is prominently drawn to the great disparity between the property of the several colleges and the numbers of the members; but from this circumstance no practical conclusion is drawn, and indeed it is manifest that a less unequal state of things might be brought about either by increasing the number of members, or dispersing the income.

The general totals also of the pecuniary income of the universities and the colleges, and the broad facts affecting its distribution, are contained in the Report, but the abstracts and the tables must be referred to for more definite information on these subjects. The general result in its baldest form is that Oxford and Cambridge have, from all sources and for all purposes, an annual revenue of over three-quarters of a million, of which Oxford has the larger share by 73,000l., and of the entire total 614,000l. comes from endowments, to which the Commissioners have given the name of external income; and the remainder, which is called internal income, from such items as room rent, fees, dues, and profits of establishments. To this latter total, which forms 94,000l., the amount of the tutorial fees, which comes to nearly 60,000l., ought to be added, before a fair comparison can be drawn between Oxford and Cambridge and similar unendowed institutions. The University of Oxford has an income of 47,000l., the University of Cambridge 34,000l., the colleges and halls of Oxford 366,000l., and the colleges of Cambridge 306,000l.; so that in all respects the elder sister is the wealthier; but it should be borne in mind that Oxford contains nineteen colleges and five halls, and has also to support the Cathedral Chapter of Christ Church; whereas Cambridge consists of sixteen colleges and Trinity Hall. It should be added that all these figures refer primarily to the year 1871, and that the number of undergraduates paying tuition fees in that year was, at Oxford about 1,550, and at Cambridge nearly 200 more. The real meaning of these figures and their comparative importance will be much emphasised when it is added that these incomes are by no means stationary, or tending to diminish. The sources of probable decrease, which the Commissioners scrupulously record, will only effect a diminution of some few hundreds, and that chiefly from the exhaustion of the coprolites on the estates of the Cambridge colleges; for the Universities, whether fortunately or the reverse, have

almost no mineral wealth. On the other hand, the University of Oxford has in the last five years received an augmentation in the annual value of its trust property of one half, viz., from ten to fifteen thousand pounds. The income of the colleges has also increased, as is well known, very much of late years, but no trustworthy data for estimating the past increase are given in this Report. But as to the probable future increase, the Commissioners have calculated that within the next fifteen years the Oxford colleges will gain, merely from the falling in of beneficial leases and of copyholds for lives, the annual sum of 123,000l., and no doubt within the next century there will be considerable gain from the other sources of income. It is estimated that the Cambridge colleges will, from this particular source, in the same period receive an augmentation of only 38,000l. With reference to this increase it may be stated that in the University trusts it has been almost entirely appropriated to specific purposes of study and instruction; whereas in the colleges, according to their present constitution, there is hardly any alternative but to augment the number and value of fellowships, scholarships, and livings.

The accounts of the Universities present but little matter for comment, and at Oxford at least they are already published annually. The Commissioners observe that at Cambridge "the stipends of officers and fees to examiners are all fixed at a low rate." The latter item amounts to 1,800l., and at Oxford to 600l. more. The professors at Oxford collectively receive from all sources almost 25,000l., of which sum not quite 460l. comes from fees, and considerably the larger portion of this from the fees of the four science professors. The Cambridge professors, who are nearly as numerous, receive 17,000l., but in their case the amount received from fees is not separately set down. The Bodleian Library receives from all sources 6,500l., the Cambridge Library about 4,000l., and the Oxford University Museum 2,600l. Oxford received in the year 1871, to which alone all these figures refer, 1,000l. from the profits of the Clarendon Press; but this sum, in accordance with statute, was treated as capital and invested. It is further to be noticed that the University of Oxford received from its colleges, towards the augmentation of professorships, independently of the Christ Church canonries, about 6,700l., and Cambridge only 1,700l.

Concerning the Colleges, the Report contains a vast amount of interesting and novel information. The total corporate endowment of those at Oxford is 270,000l., of which considerably more than one half belongs to Christ Church, Magdalen, New and St. John's; at Cambridge, out of 230,000l., Trinity, St. John's, King's, and Gonville and Caius enjoy more than two-thirds, and it is also from these eight richest colleges that the greatest increase of income is expected. Magdalen at Cambridge, and Trinity and Pembroke at Oxford, are by a considerable amount the three poorest colleges. The heads at Oxford receive on an average nearly 1,600l., but to make up this amount there is included the Deanery of Christ Church, and various ecclesiastical preferments to the amount of more than 5,000l., not indissolubly annexed to the headships. At Oxford, in fact, it is the rule and not the exception for the value of these posts to be augmented from this source. At Cambridge the heads receive on an average exactly 1,200l. each, and in only one case is part of the amount of ecclesiastical origin. The fellowships at Oxford, which are 369 in number, appear to average in value 255l. a year, while the 340 fellowships at Cambridge average 273l. These averages are not given by the Commissioners, but drawn from their figures, and the canonries at Christ Church have been excluded. The total amount paid to both heads and fellows at the two Universities comes to 255,000l., pretty equally divided between the two; and various allowances, in which matter Cambridge is by far the most generous, will increase

that total by nearly 10,000*l*. At Oxford there is expended in scholarships and exhibitions 41,000*l*., and at Cambridge 29,000*l*.; but it is mainly out of trust funds that the former University obtains this advantage. The other items of expenditure do not demand much notice, though they somehow manage to run away with one-half of the total income. It is possible that they are almost inseparable from the management of large estates, and the possession of handsome buildings and gardens, nor individually are any of them very large. Certain of them require some explanation: as 8,600*l*. spent at Oxford upon chapels, and only 1,300*l*. upon libraries; and at Cambridge the proportion awarded to the secular establishments is yet more unfavourable. It is true that at Oxford the expenditure out of trust funds goes some way to redress the balance, but there are also two circumstances not alluded to in the Report which ought not to be hidden from the public. In the first place, it is upon the musical services of the great choral chapels that by far the greater portion of the first sum is spent; and secondly, it is not an uncommon custom for part of the fees on graduation to be set apart for the library, a source of income which the Commissioners would almost appear to have overlooked. Altogether it is to be wished, not that the chapels should receive less, but that the libraries should receive more; and one Oxford college at least has, since the year 1871, suspended a fellowship expressly for this latter purpose. Another very misleading item is headed "Augmentation, &c., of Benefices," and suggests the conclusion that Oxford, out of corporate revenue alone, spends 8,700*l*. on this purpose, and Cambridge 5,200*l*. These figures may be accurate so far as they go, but a reference to the abstracts concerning the particular colleges will show that they are positively delusive. Magdalen College, Oxford, for example, is credited in the above synoptical total with only 17*l*. 10*s*., whereas in truth it devotes to that purpose, so far as can be gathered from its own rather obscure returns, the annual sum of 10,000*l*. Christ Church also is only credited with 2,000*l*., which sum according to a juster method of calculation ought to be multiplied by four. The returns of the Cambridge colleges do not afford so much matter of criticism under this head. The remainder of these unremunerative items seem to point to the general conclusion that the Oxford colleges—owing, no doubt, to the general prevalence at this University of beneficial leases—spend a larger proportion upon their estates than the Cambridge colleges, and consequently retain a smaller proportion for purposes of immediate utility. At Oxford, for example, interest on loans and repayments, and repairs and improvements on estates, require a total sum of 43,000*l*., but at Cambridge only 27,000*l*.; whereas, the collective items under the headings of college officers, maintenance of establishment, and investments amount respectively to 29,000*l*. and 35,000*l*. It is curious to notice that the rates and taxes on the college buildings at Oxford come to nearly 2,000*l*. less than the same charges at Cambridge, whilst the rateable value of the former is returned at 9,000*l*. more than of the latter. It may also be remarked that no estimate has been furnished of the probable value of the wealth stored up in the college libraries, and no doubt the attempt to gain such an estimate would have been impossible; but yet this accumulated wealth must in some cases at least, notably at Trinity, Cambridge, and Queen's, Oxford, form a not inconsiderable item in the total property of a college. In conclusion, the college livings are returned as amounting at Oxford to the annual value of 187,000*l*., and at Cambridge to 135,000*l*., but it is not at all clear whether these returns do not considerably undervalue the gross income. Some colleges appear to have sold some small portions of their patronage, and in at least one case the amount produced by such sale would appear to have been carried to the general corporate property of the college; but it

is understood to be a very doubtful legal point whether, as the law at present stands, the value of college benefices can be properly reckoned as available for ordinary academical purposes.

The abstracts of the financial condition of the several colleges, which contain much that is of general interest, must be reserved for further notice.

J. S. COTTON.

INTERNATIONAL CONGRESS OF ORIENTALISTS.

WE have been requested to publish the following letter:—

Having had the honour, as member of the Council of the German Oriental Society, to assist at the International Congress of Orientalists in London, I now beg to convey to the presidents and the members of the Managing Committee the sincere expression of our German gratitude. More especially our thanks are due to the excellent President of the Congress and its Hamitic Section, Mr. S. Birch, under whose illustrious auspices our large assembly became united from the first day in the bonds of real fellowship; to the President of the Semitic Section, Sir Henry Rawlinson, whose sagacity as a decipherer has rendered his name familiar and revered in different branches of Oriental philology; to the President of the Aryan Section, Professor Max Müller, our great countryman, whose name English science—and we are proud of it—claims among its ornaments; also to the honourable presidents of the other sections, Sir W. Elliot, Mr. Grant Duff, Professor Owen, whose special and practical studies have filled continental scholars with admiration. Hearty thanks are due to old hospitable England, and, *primo loco*, to the Right Honourable the Lord Mayor. Our gratitude for English hospitality will live on with the numerous important impressions and impulses of a purely scientific character which we have carried home with us from the Oriental Congress in London.

PROFESSOR DR. RICHARD GOSCHE,
Member of the Executive Council of the
German Oriental Society.

Halle *S. Province of Saxony,
October 8, 1874.

NOTES AND NEWS.

THE report of the Radcliffe Observer (Rev. R. Main) exhibits a very satisfactory state of affairs at the Oxford Observatory. This institution has long been honourably distinguished by the regularity with which observations are not only made, but reduced and published; and all those who know the amount of labour involved in the latter processes will appreciate the significance of the announcement that the volume of observations made in 1871 is already published, and that considerable progress has been made with that for 1872.

In the Astronomical portion, besides the usual meridian observations, the results of measures of twenty-one double stars, and of the diameter of Mars with the heliometer are given; and from the excellence of this instrument and the skill of the observer, these observations possess a peculiar value. As a result of the meteorological observations, which have been carried on regularly since 1860, Mr. Main calls attention to the circumstance that the mean annual direction of the wind (which is usually south-west) appears to follow a decennial period like the sun's spots, being more westerly at the sun-spot maximum; but the period embraced (1859–1873) is not long enough to justify anything more than a suspicion of such a connexion, and the fact that the year 1871 is discordant should induce caution in accepting such a conclusion hastily.

In *Engineering* is given an interesting account of the new observatory designed by Mr. W. Airy for Colonel Tomline, M.P., at Orwell Park. The telescope which has been erected here is of 10 inches aperture, which must be considered a very moderate size,

as compared with some of the monster refractors of the present day; but the excellence of its site and the stability of its equatorial mounting will doubtless give it certain advantages over some of its rather unwieldy rivals. The chief feature in this instrument is a device first suggested by Sir George Airy in his orbit sweeper, by which the inconvenience attendant on the so-called German form of mounting, of having to reverse the telescope when the object under observation comes to the meridian, is entirely got rid of, whilst at the same time it is practicable to apply a large hour circle (three feet in diameter in the Orwell Park equatorial), a matter of great importance in the communication of a smooth motion from the driving clock. These advantages are secured by supporting the polar axis on a casting, of which the upper portion is crooked over towards the north (instead of on a straight pillar or pier), so that the telescope swings in all positions quite clear of its support.

When a fine instrument has been erected, the most important question is what shall be done with it, and in this case a satisfactory answer can be returned. An observer (Mr. J. J. Plummer) has already been appointed who has shown what he could do with small instrumental means at Durham Observatory, and the systematic observation of the eclipses and other phenomena of Jupiter's satellites, a subject that has been much neglected of late years, will form part of his programme of work.

PROFESSOR H. FRITZ, of Zurich, has carefully discussed all available observations of the aurora borealis, and as the result of his labours has presented us with an interesting paper, accompanied by a map, in which the curves of equal frequency of this phenomenon (isochasms) are shown in their connexion with the magnetic meridians. The most noteworthy feature in this map is the curve of greatest frequency which passes along the north shores of Siberia and Lapland, and thence south of Iceland and Greenland, through the middle of Hudson Bay, where it turns northward, forming an irregular oval, which includes both the magnetic poles, and of which the southernmost point is in the meridian of Greenland. Within this region the aurora is seen in the south instead of in the north, as is the case in the outer zone, and its frequency decreases as the centre of the space is approached.

Professor Fritz points out that the magnetic meridians are on the whole perpendicular to the isochasms, and that these latter, like the ice curve, follow the forms of the two great continents. But the critical portion of the curves within the above-named oval remains yet to be mapped out, and till this is done it is hardly safe to insist much on any partial coincidence in form.

PROFESSOR SPÖRER has published the observations of sun spots which he has made at Anclam since 1861, giving a continuous record of the sun's state from 1861 to 1867, with occasional observations since. The arrangement is generally similar to that adopted by Carrington for his observations from 1853 to 1861, of which the present series may be considered the continuation; but the charts which represent the spots seen in each rotation period of the sun (about 25½ days) are drawn by Professor Spörer on a smaller scale, though their extreme delicacy compensates for this disadvantage. The measures of the positions of spots were made by means of a glass diaphragm ruled into squares by two sets of straight lines at right angles, whilst Carrington employed two diagonal lines, across which the transits of a spot and of the sun's limb were observed. By either method the apparent distance of the spot from the sun's centre, and its position angle measured from the north point of the sun's visible disc are readily obtained, and its longitude and latitude, referred to the sun's equator, deduced as soon as the position of his axis and the time of rotation are found. This latter is rather a difficult operation, for each spot has a drift of its own, so that no two spots

give the same values, and it is impossible to say which represents the true motion of the sun as a whole. Carrington concluded that, in accordance with ordinary principles, the mean would give the result nearest the truth; but Professor Spörer has preferred to trust entirely to one well-behaved spot. This seems a very questionable proceeding, and has evidently something arbitrary about it; but the problem of determining the rotation of a body from the motions of clouds in its atmosphere is a very difficult one, and in the present state of our knowledge certainty can hardly be expected. Among Professor Spörer's conclusions may be mentioned that the sun spot maximum for the southern hemisphere precedes that for the northern, and that the average number in the former case exceeds that in the latter, though, as the difference is less for the period 1861-1871 than for 1854-1864, the author anticipates a reversal of this arrangement.

While carefully discussing Carrington's splendid series of observations, it is rather strange that the author makes no allusion to the valuable series of photographs which under Mr. De La Rue's auspices have been taken regularly at Kew for the seven years from 1862 to 1868, nor to the elaborate discussion of these, as well as of Carrington's observations, in which the influence of the planets on sun spots has been traced out, and other important results deduced which are not touched on in the present paper. Is it possible that these important researches are unknown in Germany?

News has been received by telegraph of the safe arrival of the *Merope* at Christchurch, New Zealand, with the Transit of Venus party on board. The Sandwich Islands and Rodriguez expeditions have also reached their destinations without any casualty. At the latter island some difficulty was experienced in landing the instruments and heavy stores, as coral reefs prevented H.M.S. *Shearwater* from approaching the land, but eventually the instruments were landed without damage, and hoisted by means of shears to the selected site. Since then the *Shearwater* has made a trip from Mauritius and back with forty-two chronometers, which Lord Lindsay lent for the purpose, and it is proposed to repeat this operation, so that the difference of longitude between Rodriguez and Mauritius will be determined within a fraction of a second. Mauritius has been connected with Aden by Mr. Gill by means of the same forty-two chronometers, and the longitude of the latter place will be determined with great accuracy by submarine cable, the section from Suez to Aden having been already done by Mr. Gill. A submarine cable between Mauritius and Aden (the weak link in this chain of longitudes) will be laid down within a twelve-month, and when this is done the longitudes of the Mauritius group of stations will be determined to a tenth of a second, thus constituting them a first-rate group of Delisleian stations.

The Kerguelen party have left Cape Town for Kerguelen Island after some delay, caused by the breaking down of the vessel which was to have carried them; but they will have ample time to erect their observatories before December 8. While at Cape Town the Rev. Father Perry gave an interesting lecture to a large audience on the Transit of Venus.

The members of the Egyptian expedition are expected to reach Alexandria by the end of this month, their preparations not requiring so much time as in the case of the other parties.

Der Naturforscher, No. 36, contains an account of Herr Vogel's observations on the spectra of the planets. Mercury he finds to give a spectrum most in accordance with that of the sun, and that some bands which are produced by the action of our atmosphere belong to that planet. Venus likewise shows bands like those of our atmosphere. In Uranus numerous lines of the solar spectrum are recognisable, but in the least refrangible parts are a few bands which are like the

absorption bands of our atmosphere, and which indicate the presence of water vapour in considerable quantity. In the red of the Mars' spectrum, between lines C and B, are bands apparently occasioned by the planet's atmosphere, but which are too faint to be measured with accuracy.

The planetoid Vesta gave a weak spectrum, with a line identified with Fraunhofer's line F, and two bands, one corresponding with position of C-line of solar spectrum and the other with a telluric group. So far as an opinion may be formed of an object so difficult, Vesta may be presumed to be surrounded with its atmosphere. Flora gave a weak continuous spectrum, in which the colours could scarcely be distinguished.

Jupiter's spectrum lines correspond for the most part with those of Sun, but show certain special bands, particularly in the most refrangible parts; a dark band in the red being very noticeable. There are also lines and bands like those of the earth's atmosphere. The gaseous envelope of Jupiter acts on the sunlight like our atmosphere, and the presence of water vapour may be concluded. The band in the red indicates the presence of something not in our atmosphere, or perhaps a different mixture of gases. It is possible that with the same gaseous mixture, but with the different pressure and temperature belonging to Jupiter, a different absorptive spectrum would be obtained. The dark parts of Jupiter do not give a distinct spectrum, but indicate greater absorbing influence, as if they were situated deep in the planet's atmosphere. Saturn, besides showing a certain correspondence with the solar spectrum, exhibits special bands in the red and orange, which correspond with our telluric bands, except one intense band where the wave length is 618.2 mill. Mm. The blue and violet rays suffer similar absorption in passing through the Saturnian atmosphere, which is especially noticeable in the spectrum of the dark equatorial belts. The Saturn spectrum corresponds most completely with that of Jupiter; the ring spectrum is faint, and the characteristic band in the red is wanting, or feebly seen, from which it would appear that the ring has either no atmosphere or one of small height and density.

The spectrum of Uranus was found too weak for easy recognition of Fraunhofer's lines, but Herr Vogel gives several wave lengths as indicating the position of bands, and considers the presence of an atmosphere to be established. One band (wave length 618 mill. Mm.) fairly coincides with similar bands in Jupiter and Saturn.

The faint spectrum obtained from Neptune was characterised by one dark absorption band, and it is probably identical with the spectrum of Uranus.

The Athenæum states that Professor Wyville Thompson has sent home from the Challenger Expedition sixty cases of specimens preserved in alcohol, &c., which will remain unopened until he returns.

The frequent diseases of the silkworm, it is well known, induce silk-growers to alter the breed from time to time by getting eggs from elsewhere. We learn from Antioch that an English proprietor of extensive mulberry plantations near there imported some from China a few years ago, which have succeeded so well when other proprietors were losing their yield of silk through sickness of the worms, that there is now a demand for the silkworm eggs of Antioch. It was exported thence in 1873 in fifty-five packages, valued at 7,600*l.*; with what result is not yet reported.

The Fungus Meeting of the Woolhope Club, though somewhat marred by bad weather, appears to have been a success, many curious and some rare species being found during the excursions to Downton and Dinmore woods, or sent from various places for exhibition at Hereford. *The Gardener's Chronicle* especially mentions among remarkably fine specimens a *Peziza aurantia*, 8½ inches across, and *Agaricus gloiocephalus*, sent by Dr. Chapman, and found near Hereford, ten inches

high and nearly eighteen inches round the pileus. *Agaricus heteroclitus*, or *poplos*, A. *obscurus*, *ermineus*, *unicolor*, and probably *coherens*, were among the species collected, the two last being new to the British flora. At the dinner, the "Comatus soup," made with *Agaricus comatus*, was decided to be a "tasty novelty;" *Lactarius deliciosus*, or vegetable lamb's kidneys, met with equal favour; and the great puff-ball, *Lycoperdon giganteum*, figured as another dainty. At a private dinner given by Miss Guthrie, this last named fungus figured in a *salmi*; *Marasmus Oreades*, the fairy-ring champignon, supplied a sauce; and *Lactarius deliciosus* another *salmi*. There can be no doubt that tons of wholesome fungi are allowed to rot every year under the notion that they are "toadstools," and that all toadstools are poisonous; but without the guidance of Badham's *Edible Fungi*, or the works of Berkeley or Cooke, awkward mistakes are easily made. As a rule, poisonous sorts have an unpleasant smell or an acrid taste.

FINE ART.

Thorwaldsen: his Life and Works. By Eugene Plon. Translated by Mrs. Cashel Hoey. Illustrated by Thirty-nine Engravings on Steel and Wood. (London: R. Bentley & Son, 1874.)

If the reader has ever visited the Society of Arts in the Adelphi, he will have seen, and will remember, a marble statue in the entrance to the staircase, of a gentleman in a flowing wig and flowered ruffles, of a very extraordinary character. From the high heels of the buckled shoes to the eyebrows of the aspiring face, the whole figure is agitated by an uncontrollable flutter, the effort of the artist, Carlini, having evidently been to outdo painting in free movement and transitional activity. If the reader will go further, he will find in St. Peter's, gigantic saints, Veronica and others, filling niches in much the same spirit. Such was the sculpture at the time when Winckelmann, whose object in life was to re-establish Greek art, went to Rome and there consorted with Mengs, whose ideas were tending to the same end. To refer the revolution that immediately began to the writings of the single author who was most intelligent and most eloquent is not the profoundest criticism, but Winckelmann formalised and accelerated the change all Europe was somehow or other willing to accept; and at one time the adoption of antique principles and forms threatened to spread over the other imitative art, that of painting, as well. Happily the painters were a feeble people at that time, and David alone had sufficient force to propagate his ideas. Winckelmann's life was cut short in 1768, and Canova, then a boy, was soon after recognised as the exponent of the new motives, but it was impossible to go at one bound entirely out of one state into another, and now nothing can be plainer than the fact of Canova's art having been sacrificed to temporary taste and fashion. The smallness of his extremities, the doll-like taper of his fingers, the naturalism of the hair, the bright polish of his marble, were all points immensely popular, but destructive to the thoroughness of his art. Thorwaldsen came fifty years afterwards, later than Flaxman even, so that the change was accomplished and confirmed before he began to work; but yet from his

hand has come the largest, simplest, and noblest realisation of nature interpreted through the antique that has yet been done, or perhaps ever will be done.

All this is well known. Nevertheless it is worth while to recapitulate it *à propos* of this memoir, M. Plon's *Life and Works of Thorwaldsen*, in which the author does not overpraise his hero by any means, but relates his narrative in a clear, manly way, keeping his criticism brief and just. The life of the Danish sculptor was written before by his associate, Thiele, in the spirit of a friend; but M. Plon is not even a compatriot, but has accomplished his task lovingly, although in a quite independent manner. A few years ago the comparison of Canova and Thorwaldsen used to be a favourite literary exercise. David d'Angers wrote such a comparison, giving the preference to the Italian sculptor, as a Frenchman with a somewhat affected style was likely to do. The present writer's brother also published a parallel between the two, written at Rome in 1832, likewise giving the preference to Canova; but I think such a judgment will never be given again. Italy was then and is now entirely effete in art, and the artificial character of the beauties of Canova's sculpture shows this, in the same way as the imitation of the French school prevalent there does in painting. All the art-centres in the world seemed to have reached the *pretty* stage of sculpture, under Canova's leadership in some measure, and it required the Scandinavian infusion of Thorwaldsen to do anything with it at all. The rude, strong, simple, massive, and pathetic nature of the northerner (his family were not Danes, they were Icelanders) expressed itself in the clay, dimly intelligible indeed, but felt by every one. The man himself, too, could give no reasons, had no mental training in any other walk whatever, was as ignorant of all modern knowledge as an ancient Greek, inarticulate as a dumb animal, and wanting in all the vices as well as virtues of Paris and Rome; he had therefore no expression but his art, and had no *life* but on the emotional side, love leading him captive like a helpless creature.

The reader will see the character of this man, one of the most successful in a material point of view in the history of Art, is quite a new one in that region, and most interesting; although difficult to develop, except through his art, which by its nature is abstract and only slightly personal. He never said a clever thing, certainly never tried beforehand to say one; never wrote a letter that can be quoted; indolent in the last degree before he got any commissions to employ him, fortune found him out and fame, honours innumerable, without his wanting them, or thinking of them in any other light than as amusing a mind predisposed to sadness. During the last years of his life, when a welcome guest at the tables of the king and the chief nobility, he often dined with his servant Wilkens and his wife: giving away a great deal of money in charity daily to the deserving poor of Copenhagen, he would stoop painfully to pick up a button; and when Wilkens tried to get him to purchase a new pair of dress boots, told him to blacken the white lining that protruded, and the old

ones would do very well. Loving society much, he had the manner of a thorough man of the world, at the same time that he hated and resented affectation. We find he could not bear Canova, not from a jealous feeling, but because he instinctively felt him to be insincere; nor Byron, because he saw the poet assume an expression of melancholy, while his face was naturally animated by spirit and enjoyment. Sir Walter Scott, again, was entirely sympathetic to him, and their interview, as neither could speak a word of any language the other knew, is described as being charmingly ludicrous. Of Canova's behaviour to him, his own account was, as we have said, not favourable; but we must say, an anecdote given in this *Life* has a generous air. When the *Adonis* was just finished, Canova met Madame Brun at the Palazzo Doria, and at once asked if she had seen it. No, she had not; whereon he continued, "You must see it; it is an admirable statue, noble and simple, in the true antique style, and full of feeling." He added warmly, "Your friend is a divine creature," and then, after a pensive silence, added with a sigh, "It is a pity I am no more young!" What Thorwaldsen complained of was that Canova would never give any advice, or even make a remark, confining himself to flattering approval. His *Venus* and his *Jason* we think finer than his *Adonis*, and the great *Christ*, now in the Frue Kirke of Copenhagen, is certainly one of the noblest statues ever created. It was in bas-relief, however, as we all know, that Thorwaldsen excelled, which was as it ought to be, relieve being the form of sculpture that touches us moderns most nearly. The *Night*, which is so well known, was a forenoon's work, and some of his less known but most interesting bas-reliefs were similarly improvised. The *Ages of Love* is one of these. Psyche has got a great wicker-basket of cupids to dispose of, and the various action of the applicants—the merely curious little girl, the shy elder one, the delight of maidenhood, the nursing enjoyment of young womanhood, followed by the elder of but a few years who is contented to carry off her cupid hanging from her hand by the wings, are all beyond praise. At first one is mystified by the fact of inventions like these, or that of the *Shepherdess with the Nest of Loves*, and many others, coming from a man who perhaps never read a book except the Bible; but Thorwaldsen's genius is shown in the treatment, the beauty and wisdom of the expression, not in the poetic ideas on which these charming works are based. Night, the careful mother bearing away the twins, Sleep and Death, is an ancient idea formalized by many artists, Annibale Caracci among others. The *Nest of Loves* was suggested by a fresco discovered in Pompeii; another found at Stabies, called *The Market of Loves*, in the Museo Borbonico, suggested Psyche with her hamper. The artist had, moreover, a learned friend beside him from the first till nearly the last, Herr Zoëga, a man thought by many to be the equal of Winckelmann in taste and knowledge. To conclude this short notice of a book that has interested us very much, we cannot understand how ladies like Mrs. Cashel Hoey can allow their translations to appear without a few words of preface re-

garding their author or his work, Eugène Plon, is, possibly, the same "M. Plon, Librarian," who appears as a creditor for some few hundred thousand francs on the estate of the late Emperor; but we should like to know what personal relations, if any, existed between him and Thorwaldsen, also who did the little engravings heading and introducing each chapter, which are simply perfect in drawing and execution. The engravings on steel are also absolutely perfect, equal to those engraved by Amsler under the master's eye in Rome.

W. B. SCOTT.

THE MOST RECENT EXCAVATIONS IN THE COLOSSEUM.

THE results of recent labours in the Flavian Amphitheatre have been such as to throw fuller light than has ever yet been attained on the constructive plan of the building and its scientific adaptation to the purposes for which it was destined. Excavations ably directed by Signor Rosa have done more for such lighting up of the local antiquities than all achieved by the Papal Government since the comparatively modern date (1749) when it first undertook to preserve by religious consecration, before any attempt was made to repair, in brickwork masonry, the long-neglected and often abused ruins. At the depth of twenty-one feet below the actual level of the ellipse has been discovered the ancient level—the area (if not the spectacular *arena*) supposed to be the scene for public entertainments, gladiatorial combats, &c., a space now occupied by a network of small chambers and narrow parallel corridors, in masonry of inferior style resting on a pavement of *opus spicatum*, or herring-bone work. These are the buildings brought to light by the labours ordered by French authorities a few years before 1813, but which the restored Papal Government, under Pius VII., desired again to consign to oblivion, causing them to be filled with earth on account of the water which had flooded and lay stagnant in the interiors, with bad effects which might have been avoided by drainage. The ground on which the "stations" for the Via Crucis devotions stand, on the elliptic area, proves to be the summit of the ancient podium, the upper part only of the rear walls of which has been hitherto visible in the modern conditions of the ruins. Far below, at about two-thirds of the depth to which the recent *scavi* have reached, are now seen a series of immense brackets (travertine), projecting at regular intervals round the long buried walls of the ellipse. At the end of the major axis, on the southern side, have been opened three great arched entrances into vaulted corridors, the central one measuring 3 metres 85 centimètres, the lateral ones 20 metres 25 centimètres. The central corridor has not yet been thoroughly explored (having been completely filled up with accumulated clay), but several flat arches have already been reached which span the vaulting, each constructed in travertine, with enormous keystones. At the distance of 85 metres from the arena, another corridor of the same dimensions branches off from this (the central one) to the right, leading towards the Coelian Hill, and probably (we may suppose) communicating with a *civarium* for the wild beasts. The two lateral corridors, after radiating for some distance, join the central one at right angles. In each of these have been found six immense bronze sockets set into circular cavities along the walls. Below the ancient level of the elliptic area, Signor Rosa has discovered a cloaca, about two metres in depth, lined with good masonry, the mouth opening between the floor of the central corridor and the level of the area, with which this channel communicates, its entrance being fenced by the bars of a metal grating.

Another interesting discovery consists of several

marble alaba, probably for wall panelling, on which are deeply incised *graffiti* representing gladiators in combat, other gladiators (*bestiarii*) fighting with a tiger, and four men with lances attacking a deer; also a hare and a rhinoceros exhibiting feats such as are described, among other exhibitions of wild and tame animals on the amphitheatre, by Martial, *De Spectaculis*, 9, 11, 19, 22, 52.

The general conclusions to which, I believe, we may arrive, observing what is now visible in the lower storey of the great amphitheatre, are the following:—That the spectacular arena was a boarded stage, supported on the travertine brackets recently brought to light; that the lowest, the *terra firma* arena (as we might call it) served for the *naumachia*, prior to the performance of which the elliptical area would have been flooded with water introduced from the cloaca, and the boarded stage above must have been, of course, removed; that the network of chambers and corridors built on that lowest level (the paved arena) have no connexion with the antique constructions, but may be ascribed to the Frangipani, which baronial family fortified the Colosseum in 1130, and for some time afterwards held it as their chief castle before it passed into the possession of another family, the Annibaldeschi, who held and defended this fortress till 1312. As to the great bronze sockets in the walls of the corridors, it may be supposed that they served for fastening the pivots of swing gates, one within another, enclosing so many pens, out of which, when successively opened, the wild beasts might have been let loose to find their way and bound on the arena, while the gladiators and other performers, or victims (e.g. the Christian martyrs), may have entered on that stage from the central corridor. It may be conjectured that the level of the ellipse hitherto supposed to be that of the ancient arena was formed by an accumulation of earth above the buried buildings of the Frangipani (or whoever raised those long concealed structures) on occasion of the grand spectacular bull fight given in 1332, as described by the chronicler Monaldeschi (v. Muratori, *Rer. Ital. Script.*), in which many young Roman nobles took part, but the results of which, after a few hours of splendid pageantry, were most tragic—eighteen young men of distinguished families being left dead, and seven others seriously wounded, that day, on the fatal arena. How deep is the interest excited by the monuments of ancient Rome, when even things that serve to remind us of cruelty and outrage, of savage indifference to human life, and sacrifice of that life for public amusement, are sure to be regarded with attentive curiosity awakened at every stage in the progress of antiquarian research!

C. I. HEMANS.

NOTES AND NEWS.

THE name of Andrew Fountaine is so identified with Art that his death should not pass unrecorded. The fine collection of Narford Hall was founded by his ancestor, Sir Andrew Fountaine, the friend of Pope and Swift, successor as Warden of the Mint to Sir Isaac Newton, and Vice-Chamberlain to Queen Caroline. Sir Andrew travelled throughout Europe, and resided some years at the Court of Duke Cosimo de' Medici, from whom he acquired many of his finest works of art. His collection of majolica, Palissy ware and Limoges enamels is unrivalled. Inheritor of the property and of its art treasures at the age of twenty-seven, Mr. Andrew Fountaine had full opportunity of cultivating his hereditary taste. He was a true lover of Art in all its phases, and could appreciate her manifold productions, though his leaning was more especially towards those of the Cinque-Cento period. He lost no opportunity of enriching the collection by the purchase of new specimens, and indeed there is scarcely any portion of the decoration of the house, or of the works of art which it

contains, which does not bear the impress of his improving hand. "Narford Hall," as Mr. Mayvatt writes, "is a complete museum of paintings, books, manuscripts, sculptures, pottery, enamels, gems, ivories, and bronzes, of inappreciable value, and so numerous as to defy description." Mr. Fountaine devoted much of his time to naval architecture and to music, he was a great proficient on the violin. These sedentary pursuits impaired his fine constitution, and he died August 21, at the age of sixty-five. He left three daughters. Narford and the fine collections are strictly entailed.

MR. CHARLES HEATH WILSON, it is affirmed, is to be the English translator of Aurelio Gotti's forthcoming life of Michael Angelo. This important work, as we have before announced, is to be published simultaneously in Italian, French, and German, and, we may now add, in English. Mr. C. C. Black will be ready with his contribution to Michael Angelo literature at Christmas. It will appear as one of Mr. Macmillan's splendidly illustrated volumes.

A STATUE to Guizot is to be erected at Nimes, in the garden of the New Museum.

THE project of a National Exhibition of Fine Arts at Naples, mentioned in a previous number of the ACADEMY, has at length been decided upon, and its opening definitively fixed for November 1, 1875. The want of a suitable building for such an exhibition, and the immense expense involved in building one, was at first one of the difficulties in the way, but it has now been determined that San Giovannello shall be restored for the purpose, and the necessary works have already commenced. At the same time as the modern exhibition, the committee promise a Retrospective exhibition of Neapolitan art, so that the art of the south provinces of Italy will be represented from the earliest times to the present. Considering what these provinces formerly produced in the way of art, and their ingenious applications of art to industry, this can scarcely fail to be a very interesting exhibition. Prizes are offered by the committee for the best works in painting, sculpture, and the decorative arts.

THE statue in white marble of Mirabeau, by M. François Truphème, which was much admired at the last Salon, will shortly be set up in the Palais de Justice at Aix.

M. DOUBLEMARD, who recently received a commission for a statue of Bolivar for the town of Guayaquil, has submitted his model for this monument to the Government. It will cost, the *Chronique* states, no less than 80,000 francs.

THE last two numbers of the *Chronique* have been chiefly occupied by an exposition, by E. Véron, of the aims and *raison d'être* of the Union Centrale des Beaux-Arts. It seems that these aims are much misunderstood, even in France, and to English enquirers still more the question "Qu'est ce que l'Union Centrale des Beaux-Arts appliqués à l'Industrie?" suggests itself. The answer does not seem to be easy, for M. Véron takes twelve pages of the *Chronique* to explain it; but it may suffice some of our readers to know that the "Union Centrale" is a society that has been founded for the purpose of maintaining the art supremacy of France, especially in those arts which "realise the beautiful in the useful." France appears to have been alarmed by the recent progress of England and other nations in their artistic industries, and feels that she must really exert herself, or that else she may have some presumptuous rival presuming to contest her loudly asserted superiority. The Union Centrale is an effort to shut the stable door. Is it after the steed is stolen?

THE death of M. Achille Tabutin, a distinguished decorative artist, is announced as having taken place in Paris, where he was employed in painting some of the principal scenes for the New Opera.

MR. CALDERON, R.A., has left London for the south of France, where, it is announced, he purposes spending the winter.

MISS THOMPSON'S *Roll Call* seems to be making a tour through the provinces. Newcastle-on-Tyne will, it is stated, have the benefit of it next week.

THE Sultan of Turkey, who for some time past has been making a collection of blue and white china, has recently purchased two magnificent Japanese vases that are described as the largest, and in some respects the finest, ever made in Japan.

A LOAN exhibition of modern oil and water-colour paintings has just been opened at Reading. It was only a month before that the project for such an exhibition was started, and already more than 300 pictures have been contributed by various collectors in the town and neighbourhood. The Duke of Wellington especially has sent a good selection from his seat at Strathfieldsaye, and Mr. W. Banbury, Sir Charles Russell, Sir Paul Hunter, and other gentlemen, have lent many important works by some of our most distinguished modern artists. To Mr. W. J. Palmer is mainly due, we believe, the success of the undertaking.

DR. HELBIG continues, in the *Bulletino dell' Inst. di corrisp. Arch.* for August and September, his description of certain tombs at Chiusi in which have been found important specimens of archaic Etruscan art (see ACADEMY, vol. v., p. 587). As yet the archaic phase of that art has been very sparsely illustrated compared with the abundance of specimens of rude primitive work on the one hand, and the late productions of Roman times on the other. At present M. Helbig confines himself to the description of a tomb opened lately in a small hill on the estate of Pania, three miles from Chiusi; it was built of large squared blocks of travertine, and, unless in one respect, did not present any peculiarity of construction. Part of the floor or pavement of the tomb was found covered, as if with a carpet, with long strips of bronze fastened together with nails, and resting on iron rods placed across each other at right angles. Unfortunately these strips of bronze were too much decayed to be judged of as to their original ornamentation; at one part it would seem to have consisted of lotus flowers. This, and a tomb which had before been excavated at Fonterotella, where the walls were found coated with bronze plates to some distance up from the ground, are the only two instances of the custom of decorating walls with metal plates which we know from Homer and from the Treasury of Atreus at Mycenae to have obtained in Homeric and pre-Homeric times. The tomb in question had, it was found, been previously opened and rifled, but though almost everything of intrinsic value had been abstracted, there had been left behind, among much that was thought worthless, one object of very unusual interest. It is a piece of ivory of cylindrical form, being a slice or section of an elephant's tusk, 21 centimètres high and 66 centimètres in diameter. It is encircled with parallel bands of reliefs, partly consisting of figures and partly of ornament, in a severe archaic style and with marks of Asiatic influence. In several places the ivory has suffered from decay and left lacunae, but enough remains to show that on the second band, counting from the top, was represented the episode in the *Odyssey* where the doings of Ulysses and Polyphemus are recorded. There is the ship in the port of the island of the Cyclopes; towards it come two of the crew, apparently in great joy, followed by a huge ram, under the belly of which is hanging a man; then comes a long lacuna, after which is again a ram which also appears to carry a man. Beside the mast are two amphorae, to indicate the means by which Polyphemus was at first overcome. Scenes from the heroic legends of Greece are of the greatest rarity among the

early Etruscan works of art. On the other hands are groups and processions of figures in chariots and on foot. On one hand Dr. Helbig noticed a centauress with human instead of equine forelegs, a circumstance which points also to a very early period of art.

AN interesting history of Georg Hesz, a German sculptor, who has made a great position for himself in New York, may be read in the *Zeitschrift für Bildende Kunst* of last month. Hesz was born in 1832 at Pfungstadt, in the grand duchy of Hesse. His parents dying when he was quite a child, he was left to the care of a brother-in-law, and at the age of fourteen was apprenticed to a tinker, from whose violence he had much to suffer, and in whose service he learnt, if nothing else, at least to know hunger from personal experience. In spite, however, of the frightful hardships of this youthful time, he managed to get a little schooling, and even received prizes for drawing at a workman's Sunday school that he attended at Darmstadt. When he was eighteen he emigrated to America, where he obtained employment, first as a slater of roofs, then as spectacle-case maker, and eventually as a wood carver in a cabinet-maker's establishment. Here for the first time in his life he experienced the pleasing sensation of having regular and sufficient food, a sensation that he has recorded as being extremely satisfactory in several of his poems of this period, for this repressed but struggling genius solaced himself with poetry as well as art. As a cabinet maker he earned so much money that by the time he was five-and-twenty he had saved sufficient to enable him to carry out his cherished idea of going back to Germany to study for four years at the Munich Academy. At the end of this period he married, and after two more years spent in Europe, he returned to America with an invalid wife, and without any means of subsistence, at the time when the American war was at its height. Naturally, artistic productions were then but little in request, and Hesz again had to fight for bare existence. "I walked on the borders of despair," he wrote, "and it was only owing to a powerful effort that I did not fall in." But he bore up bravely until better times came. He first obtained notice by his busts, and by two humorous little statuettes, called "Gold up," and "Gold down," and now he is reckoned one of the first artists in America. His greatest work is a statue of Goethe in his youth, which it is contemplated to have cast in bronze, and placed in the Central Park of New York.

The other articles of the number are chiefly continuations.

A CATALOGUE of the Royal Museum at the Hague has at last been published that is in every way worthy of that splendid collection of Dutch masters. For many years past students and visitors have had to be content with a miserable little pamphlet, sold at the doors at a high price, and containing an amount of misinformation that few works of the kind ever exceeded. The new catalogue is a volume of 363 pages, containing biographical notices of each artist, with facsimiles of signatures and monograms, and minute details as to each picture, after the pattern of the excellent catalogue of the Antwerp Museum. It has been compiled by Herr van Stuers, who has spared no trouble in making it as accurate as possible, but who still in his modest preface "claims indulgence" for his work on account of its great difficulties, and hopes that it will "form the basis of one more correct." Meanwhile, however, much may be learnt from this *Notice Historique et Descriptive des Tableaux et des Sculptures exposées dans le Musée Royal de la Haye*.

The projected International Exhibition at Philadelphia will be opened, it is stated, on April 19, 1876.

THE Berlin Museum is rapidly growing to immense importance. The purchase of the Suermondt collection makes, in fact, an epoch in its

history. Few museums have ever had the opportunity of acquiring so many excellent works by old masters at one time. But besides its immense additions in the way of paintings, it has been gathering up treasures of late in many other departments. Among its most noteworthy acquisitions in engravings is a complete set of the etchings of Albert van Everdingen, consisting of 266 plates, in such a good condition that they are considered by connoisseurs to be only rivalled by the magnificent set in the British Museum. The collection was made in Holland by Herr Drugulin, of Leipzig, who published a monograph on Everdingen a short time ago, and has now been sold to the museum for the sum of 6,000 thalers. The Greek antiquities also, brought by Professor Curtius from Athens and Olympia, have a considerable interest and value.

ANSELM FEUERRACH has been entrusted with the decoration of the Academy of Vienna. He has chosen his subjects, it is stated, from Greek mythology, and will execute as many as thirty-one separate wall paintings.

A PAMPHLET, entitled *Londinias*, by the well-known art critic C. Vosmaer, has been published at the Hague. It is a good-natured satirical poem, illustrated with amusing sketches by the author. It appears to have been much appreciated by our Dutch neighbours, for it has already reached a second edition. Unfortunately, it being written in Dutch, but few Englishmen will be able to enjoy its fun.

THE *Düsseldorfer Zeitung* announces the death, on the 29th of last month, of Professor Theodor Hildebrandt, at the age of seventy. Hildebrandt, who ranked as one of the best of Schadow's pupils, exerted a very favourable influence on the Düsseldorf school of painting, where he succeeded Kolbe, in 1836, as Professor and Director of the higher classes of the Academy. His pictures have always been popular in Germany, where his *Sons of Edward*, which is regarded as one of the best of his works, has been more frequently copied than almost any other composition belonging to the modern school, of which he was a prominent leader. He enjoyed considerable reputation as a portrait painter, and his admirable picture of the Belgian painter Wappers, now in the Düsseldorf gallery, shows that the esteem in which he was held was fully merited.

A RECENT picture sale, which was held on September 28 and the three following days at Munich, under the direction of Councillor Karl Förster, showed by the prices realised how much the wealth of the Bavarian capital has increased within the last few years, for it would perhaps be going too far to say that the larger sums given for pictures and objects of vertu in the present day is a perfectly trustworthy indication of a corresponding increase in the appreciation of art. When in the last generation an A. van der Meer brought 1,900 gulden at the sale of the famous gallery which had belonged to the Canon Speth, the sum was thought excessive; yet at the recent Munich auction 12,000 gulden were given for a Paul Potter from the Triepel collection; 14,000 gulden for a portrait of the painter Casper de Crayer, by Van Dyck; and 2,500 gulden for Albert Dürer's portrait of the Burgomaster Müffel. It is not only the old German and Dutch masters who find approval among the wealthy classes of the present day in Bavaria, for the exhibition of the works of modern artists at Munich has this year brought the fortunate exhibitors nearly 50,000 gulden as the result of the sales and orders to which it has given rise.

At a sale at the Hague of the Van der Willigen collection of drawings by the old masters, the following prices were obtained:—A. Cuyp, *View of Utrecht*, 300 fl. (the Dutch florin is equal to 1s. 8d. English); Doomer, *Environ of Cleves*, 150 fl.; G. Dow, *Two Portraits*, 250 fl.; Dusart, *Fête of*

St. Nicholas, 205 fl.; Esselens and Hobbema, *View of Arnhem*, 100 fl.; A. v. Ostade, *Interior of an Ale-house*, 900 fl., and *Exterior of a Rustic House*, 100 fl.; Raffaele, *A Child's Face*, allegory, 100 fl.; Rembrandt, *Benediction of Isaac*, 200 fl.; *Man and Woman on Horseback*, 200 fl.; *Figure of a Chinese Man*, 130 fl.; *Crouching Lion*, 170 fl.; and *Wooded Landscape*, 150 fl.; Rubens, *Girls at Bathing*, 110 fl.; J. Ruysdael, *Landscape*, 110 fl., and a *Wooded Landscape*, 190 fl.; H. Saftleven, *The Seasons*, 360 fl.; Schotel, *Still Water*, 150 fl.; J. Steen, *A Market*, 100 fl.; C. Troost, *Winter Evening*, 595 fl., and *Pandours on Horseback*, 150 fl.; A. van de Velde, *Landscape*, 115 fl.

THE STAGE.

MR. SOTHERN AT THE HAYMARKET.

THE public curiosity has been great during the week to see Mr. Sothern in Dundreary at the Haymarket—they wanted, no doubt, to see what it was that they thought brilliant a dozen years ago. And Mr. Sothern's jokes are found to have all the sacredness of old association. Like Mr. Hardcastle's, in *She Stoops to Conquer*, they are privileged things. Our Diggory "can't help laughing at them, for the soul of him." He has "laughed at them for the last twenty years—ha! ha! ha!"

But then we all had better reasons when we began than now. The piece itself had some pretension to be called a comedy then. It is now a farce drawn out into four acts. The stage situations (for probably there were situations once) seem to have disappeared. At the end of the first act the curtain falls upon nothing. Had it fallen ten minutes earlier no one would have noticed the difference; and when it does fall, it looks like an accident, for nothing has been arrived at—the story has not moved an inch: there is apparently no story to move. The second act begins and closes, and when it is over we have gathered that a number of uninteresting and improbable persons are staying at a large country-house—that there has entered to them an American whose appearance makes their improbability seem probable, and that in his turn too, there has entered to them an English nobleman, stranger than all the rest.

Dundreary has a raspy, stony voice. He stammers, skips, and wears a violet satin dressing-gown. He has very knowing eyes—his only sign of intellect—and he is entirely satisfied with his own opinion of all that he perceives. And thus far evidently he has but observed life, while others have taken part in it. As we see him to-day, he must have dwelt far enough from his fellows. He is an oddity now, and yet he used to be a type—while he was a type he was amusing: as an oddity we are not quite sure that he is not a bore. For the piece in which he figures is sacrificed to his display—better things may have been sacrificed to worse objects before now—and his display is that of a being we do not know in London. His merit was that he reflected something which we knew; but we do not know the like of him any more. He represented a passing phase, and the phase is past. So that the thing has no longer even the truth of caricature, for being made up of externals, upon a study of fleeting manners, and not upon a study of our abiding weaknesses, it has lost real force while it has gained in extravagance. Dundreary comes to us, a revenant from an unseen world—the pale ghost of past-away manners—a caricature of Gillray's has more to say to you to-day.

And yet you are entirely conscious, when you come away, that an actor of real intelligence has been taking infinite pains—that every laugh is calculated, every joke elaborated, and every stumble counted, in the performance. He plays a tedious farce as carefully as Got plays comedy that is worth playing, and with well nigh as little of the disagreeable sense of labour so long as the labour

is actually proceeding. You feel, too, that the thing is, in its way, a creation: if a piece has been spoilt for the making of it, still it has been made after all, and is very definite and individual, though a little vulgarized and common—it is conceived at all events with no confusion of ideas: executed with no mistake of means.

You can't affect to care about the serious interest, now that it is cut down as closely as it can be. Asa Trenchard is a grotesque; Richard Coyle, the wicked lawyer, a stage villain whom nobody fears; Abel Murcott a stage drunkard, whose cups are a shadowy weakness; Georgina a lav figure whom you can shift at will. Performers like Mr. Buckstone, Mr. Howe, Mr. Rogers, Miss Linda Dietz appear as the representatives of these figures which circle round Dundreary. They have seen more fortunate days, and will see them again, and the sooner the better for all of us. Mary Meredith, in her grey serge—a figure somewhat apart—retains the most of individuality and interest. She is played by a young actress from America—from the Fifth Avenue Theatre, New York—by name, Miss Walton—and Miss Walton plays simply and well. But one would have to play very well indeed to make us forget all that is tiresome in *Our American Cousin*.

FREDERICK WEDMORE.

MR. AND MRS. KENDAL have accepted, it is reported, a short engagement at the Prince of Wales's Theatre, after Christmas. Before then, it is just possible that Mrs. Kendal may be playing Ophelia in the revival of *Hamlet* at the Lyceum. Mrs. Kendal's Ophelia would be that of a competent artist.

THE Saint James's Theatre will open this day week with an opera-bouffe by Lecocq, called *The Black Prince*. Mr. Chatterton, the excellent singer now singing in the *Broken Branch* at the Opera Comique, will appear there. So will Miss Selina Dolaro and Miss Nellie Bromley, along with the possessors of less known names.

Newmarket: a Tale of the Turf, will be played at the Holborn Theatre when it opens, to-night. This is the place where *Flying Scud*—the last of our horsey dramas—was so successful.

MDME. CELESTE has gone on playing at the Adelphi, and was to take her benefit last evening. This evening they will change the programme, and produce *The Geneva Cross*, by Mr. G. F. Rowe, a sensational piece, which has been performed five hundred times in America. Mr. H. Sinclair, Mr. James Fernandez, Miss Edith Stuart, Miss M. Henderson, and several others are included in the cast.

Old Sailors—one of Mr. Byron's new comedies—is to be brought out at the Strand on Monday next.

THE Royal Holborn Amphitheatre opens to-night with opera bouffe, so that there is no end of chronicling fresh things at London playhouses.

CROYDON has got its theatre. The new manager is Mr. Charles Kelly, who played very well the part of Richard Arkwright in the play by Mr. Tom Taylor and Mr. John Saunders which dealt with the misfortunes of the inventor of the spinning-jenny. The new piece is Mr. Tom Taylor's *White Cockade*—a pendant, they say, to his *Clancarty*.

MISS LITTON reappears before the London public on Tuesday, re-opening the Court Theatre with *Peacock's Holiday*, and Mr. Branson Howard's *Saratoga*, an American piece which was fairly successful last season.

THE *Journal de Saint Pétersbourg* criticises a recent performance of M. Feuillet's *Roman d'un Jeune Homme Pauvre*, at the Théâtre Français of St. Petersburg, in which the part of the heroine, usually played at St. Petersburg by Delaporte,

was acted by a débutante, Mdle. Athalie Manvoy, who does not seem to have done anything to cause the Russian playgoers to forget her predecessor.

THE revival of M. Dumas's comedy, *La Princesse Georges*, at the Gymnase Dramatique, took place on Tuesday night, when there was a great gathering of people to see a new actress, who has adopted the name of Tallandiera, essay the part made famous by the art of Desclée.

IN Paris, where all educated people care about the Theatre, a new experiment in criticism is about to be tried. M. Henri de Lapommeraye will lecture, every Monday evening, on the pieces of the preceding week. But it may be that with all their care for the theatre, people will hardly go out to hear on one night what were the merits of the play they saw the night before.

THE literary and musical *matinées* of the Paris Gaité are to recommence immediately, and M. François Coppée has written for the occasion a prologue which his friends declare to be charming.

THERE was more than one report to the effect that M. Humbert, the well-known director of the Théâtre des Fantaisies Parisiennes, at Brussels, was dead. He is alive, and in Paris, and extremely well.

THE *Veuve*, by Meilhac and Halévy, is in active rehearsal at the Gymnase. Mdle. Blanche Pierson will appear in it. The decorations will be not only costly but genuinely artistic. Among them are to be a picture by Berne-Bellecour, and a marble bust by Franceschi, a sculptor who is much in vogue.

MDME. FARGUEIL has just signed an agreement to act at the Ambigu Comique. As *drame* is just as much within her means as comedy, she will do well even in a piece of "five acts and six tableaux."

M. THÉODORE BARRIÈRE has read to the actors at the Paris Vaudeville a new play called *Le Chemin de Damas*, and the reading is said to have resulted in a favourable verdict by the actors on the piece. Parade and Saint Germain will take part in the new production.

Marcelle, the piece now playing at the corner of the Chaussée d'Antin, is a comedy of peculiar quality. The action passes in a *maison de santé*, and the cheerful comedy has for its themes illness, death, and the funeral. The piece might have suited the Ambigu, if the Ambigu had been sorely pressed, but is entirely out of place at the Vaudeville. Nor is the interpretation worthy of much praise, the absence of Mdme. Fargueil being felt severely. *Marcelle* will be withdrawn before very long.

THE performance of Casimir Delavigne's *Don Juan d'Autriche* at the Porte Saint Martin affords M. Sarcey the opportunity for one of his penetrating criticisms. He remarks that while the managers call it an historical drama, the publishers call it a comedy, and he thinks that the publishers are right. It is a comedy, he says, written under the cover of historical names, and written, as we may say in parenthesis, under the disadvantages under which historical drama suffers—that the public knows the *dénouement* as well as the writer does, and cannot therefore be deceived by any skill in the conduct of intrigue. The first act, says M. Sarcey, is one of the gayest and wittiest exhibitions known at the theatre. The third is from beginning to end full of the best sort of pleasantry. And in the three others it is not difficult to perceive, even, he says, in pathetic situations, many a touch of raillery and satire. At the Théâtre Français, this intention to make the piece an historical comedy, as distinguished from drama, was always carefully respected. It has been respected less at the Odéon, though this is not the fault of Dumaine, the actor who, as we said last week, plays Charles the Fifth as if that monarch were only a jolly fellow. But

Taillade, who is always inclined to emphasise all that there may be of sombre in a character, commits that usual error of exaggeration, and represents Philippe Deux with more talent than discretion. As a whole, Taillade's play is fatiguing, but here and there it is strangely good. The only important woman's part is that of Clorinda, and this is played by Mdle. Patry—a young actress of great promise, who deserved, as many people think, last time at the Conservatoire, that first prize which she did not get. Thanks to her not getting it, her name appeared a good deal in the papers—people who had seen her raised discussions upon her claims—and she was speedily engaged at the Porte Saint Martin. On the whole (and owing, it is said, to illness), Mdle. Patry has not played well in Casimir Delavigne's comedy, but from time to time she justified the good opinion formed of her by the exhibition of wild abandonment and deep sensibility. The part of the novice, Pueblo, is an easy part to play. It is played very pleasantly by Mdle. Angèle Moreau, who in Paris was the blind heroine of *Two Orphans*.

MUSIC.

LEEDS MUSICAL FESTIVAL.

Leeds: Wednesday, October 14, 1874.

THE festival which commenced here this morning presents several features of resemblance, several also of contrast, to that of Liverpool, which a fortnight since it was my duty to report in these columns. Like its precursor, the present is a new venture—no regular festivals having been previously held in this town. Both band and chorus, moreover, are of nearly the same strength as at Liverpool; and at both places the first work in the programme is *St. Paul*. Several of the same principal soloists are also engaged for both festivals. Among the chief points of contrast are, first, that the wind players, instead of being mostly local performers, consist of the *élite* of our London orchestras. The wind was the weak point at Liverpool; here, on the contrary, is a force which it would be impossible to surpass. It is only needful to mention the names of Messrs. Radcliffe, Barret, Lazarus, Hutchins, Hawes, C. and T. Harper, Reynolds, and Hughes, to show that the chief wind parts are in the most competent hands. At Liverpool, again, there were several new works composed especially for the festival. Here, with the exception of an unaccompanied chorus by Dr. Spark, this is not the case; but, as a compensation, will be heard several works which are but seldom performed. Foremost in interest and importance among these is Schumann's *Paradise and the Peri*; while English art is to be represented by Macfarren's *St. John the Baptist*, and Smart's *Bride of Dunkerron*. The Liverpool Festival was conducted by Sir Julius Benedict; the present is directed by Sir Michael Costa.

The only previous festival held at Leeds was on the occasion of the opening of the Town Hall in September 1858. On that occasion Mr. (now Sir) Sterndale Bennett was the conductor, and the chief works performed were the *Elijah*, Rossini's *Stabat Mater*, Bennett's *May Queen*, a selection from Bach's *Passion Music*, Beethoven's *Mount of Olives*, two parts of Haydn's *Seasons*, *Israel in Egypt* and the *Messiah*, besides miscellaneous concerts. The festival was highly successful, about 2000*l.* having been raised for the benefit of the General Infirmary; and an effort was made in 1861 to establish a regular triennial festival, similar to those at Birmingham and Norwich. For reasons into which it is not necessary to enter here, the project fell through, nor was it revived till the spring of the present year. It has now, however, been so warmly taken up that a guarantee fund has been raised amounting to nearly 7,000*l.*

This morning the festival has been inaugurated (as intimated above) by a performance of Mendelssohn's *St. Paul*. The work itself has been

so recently spoken of in the ACADEMY that it is needless to do more than give a few details with respect to the execution. And first, mention must be made of the truly superb singing of the chorus. It is difficult to speak the simple truth about them without appearing to exaggerate. I will simply say that never in my life do I remember having heard chorus singing to equal it. The splendid resonance of the voices, and their rich pure tone, the perfect accuracy of their intonation, the preciseness and decision of their "attack," and the delicacy of their piano singing, were alike marvellous. Yorkshire singers have long enjoyed a high reputation, which the Leeds chorus this morning have shown themselves fully able to maintain. The solo parts were in the hands of Mdlle. Titiens, Mdme. Patey, and Messrs. Lloyd and Santley, any praise of whom is superfluous; and the accompaniments were played to perfection by the orchestra under Sir Michael Costa's direction. A more auspicious commencement to the festival could not have been desired.

As it will be too late for me to continue my report in the present number, it will be as well to give an abstract of the chief items of the coming concerts, reserving till next week any remarks upon them. This evening there will be a miscellaneous concert, the most important features of which will be Mozart's "Jupiter" symphony, Mendelssohn's Violin Concerto, played by M. Sainton, and the overtures to *Euryanthe*, *Paradise and the Peri* (Bennett), and *Zampa*. Dr. Spark's unaccompanied chorus, mentioned above, is also included in the programme. To-morrow morning will be given Handel's First Organ Concerto (Dr. Spark at the organ), the *Lobgesang*, and a selection from *Israel in Egypt*. To-morrow evening, the second miscellaneous concert, with the "Pastoral" symphony, Smart's cantata *The Bride of Dunkerron*, the overture to *La Gazza Ladra*, Sullivan's "Overture di Ballo," and various vocal pieces. Friday morning will be devoted to Macfarren's *St. John the Baptist*, and Rossini's *Stabat Mater*; on the evening of the same day will be given Schumann's *Paradise and the Peri*, and a miscellaneous selection; and on Saturday morning the *Messiah* will bring the festival to a close. The only objection to be made to this very excellent scheme is that the evening concerts are likely to be far too long.

EBENEZER PROUT.

THE present series of Saturday Concerts at the Crystal Palace began last Saturday, and it was at once manifest that there was no falling off either in the interest of the programme or in the finish of the execution. Our limited space precludes us from entering so fully into details as we could desire, but special mention must be made of the two novelties of the performance. The first of these was Mendelssohn's overture in C, op. 24, usually known as the "Military" overture. Dr. Julius Rietz states that it was originally composed in 1824—when Mendelssohn was fifteen years old—for the wind-band at the baths of Dobberan. It was subsequently rescored for a full military band, in which form it is published, and has been occasionally performed in this country. It is probably best known in the arrangement for piano duet by the composer himself. Though not one of his greatest, it is one of his most pleasing and genial works. From the fact of its being written for wind instruments only, it was unavailable for performance at the Saturday Concerts; and Mr. Manns has therefore arranged it for an ordinary full orchestra. Of the manner in which he has acquitted himself of his task it is difficult to speak too highly. Especially praiseworthy is the conscientious reverence everywhere shown for the composer's original intentions. The overture in its new dress is most effective, and forms a very useful addition to the repertoire of concert overtures. That it was heartily enjoyed by the audience will be readily imagined by those who know the music. A greater contrast

can scarcely be conceived to this bright and sparkling piece than the second novelty on the day—Wagner's "Faust Overture," with which the concert closed, and which was played on this occasion for the first time in England. This overture is not so much programme-music, as what the Germans call a "Stimmungsbild," the key to which is furnished by the motto from Goethe's poem, which is given on the title-page of the score. It is the passage in which Faust declares existence to be a burden, death desired, and life detested. Naturally a sombre tone-picture should be expected; and such indeed is the overture. It presents some points of analogy with Schumann's overture to *Manfred*, is full of wild and gloomy beauty, and is in all respects a very remarkable, though never likely to be a widely popular work. The Symphony was Beethoven's No. 2 in D, and the instrumentalist for the day was Mr. Franklin Taylor, a pianist whose powers seem to ripen every year. He brought forward Bennett's graceful and well-written concerto in F minor, which he played not only with highly finished mechanism, but with much fire and excellent taste. The vocalists were Mr. E. Lloyd and Mr. Santley, neither of whom need any eulogy in these columns. To-day Dr. Hans von Bülow is announced to play Liszt's "Fantaisie Hongroise," and Mr. Henry Gadsby's overture, *The Witches' Frolic*, written for the British Orchestral Society, is also in the programme.

THE opera at Weimar, which last season distinguished itself by the production of Wagner's *Tristan und Isolde*, has commenced another season which promises to be no less interesting than its predecessor. A special feature is to be the revival of the two *Iphigenias* of Gluck. Among the novelties to be brought forward are named Metzdorff's *Rosamunde* and Franz von Holstein's *Heideschacht*.

THE prospectus of the series of winter concerts at Elberfeld, which commence on the 31st inst, is noteworthy as showing the amount of musical enterprise to be found in the smaller towns of Germany. The chief works to be produced in the six concerts of which the series consists are Haydn's *Seasons*, Handel's *Israel in Egypt*, Schumann's *Des Sängers Fluch*, Bruch's *Odysseus*, Brahms's *Triumphlied*, and Bach's *Matthäuspassion*.

THE coming season is likely to be rich in new symphonies. Besides Raff's new one in D minor (No. 6), works of this class are either published or promised by Rheinberger, Reinecke, Grimm, Hofman, and Klughardt, to say nothing of others which have not yet found a publisher.

THE popular composer Suppé has completed a new operetta, entitled *Die Reise in den Mond*.

It has been calculated, says the *Musikalisches Wochenblatt*, that J. Offenbach, since September 1, 1873, has received upwards of 2,000,000 francs for the performances of only three of his pieces.

A MONUMENT to Franz Schubert is shortly to be unveiled at Baden, near Vienna.

POSTSCRIPT.

HON. EDWARD TWISLETON, whose death is announced this week, had an old-world manner, and quiet quaintness, that were especially attractive. He spoke with a laugh and a little twist of the head, that was humour in itself. His words had always something behind them—something more to say after the first eagerness, but which often never came. His scholarship touched all he spoke and wrote; it was the true love of the old gods, and he would talk of them as of living men. He was the heart and soul of the Dilettanti Society, taking more interest in its work than in that of any existing institution. His researches on the coast of Asia Minor and the unearthing of its rare temples, were to him like opening the graves of his

ancestors. He was never quite the same man since his great trouble, but no sorrow would darken the thorough goodness of his disposition and inherent sweetness of nature. Mr. Twisleton served on the Oxford University, Public Schools, and other Commissions. His book on the Handwriting of Junius was the occasion of the Lord Chief Justice of England taking up the whole question of the authorship of the Junius Letters for the ACADEMY. Mr. Twisleton was also an occasional contributor to these pages.

M. ANGELO DE GUBERNATIS, editor of the *Rivista Europea* writes a sufficiently peppery letter published in the October number of his review, addressed (apparently during an interregnum) to the "present or future" Minister of Public Instruction, complaining that Italy was not represented at the Oriental Congress in London, while even India, Egypt, China, Japan, and America sent their delegates. He complains that to the urgent representations made to the functionary in question it was replied that it was for the Oriental Society to find the funds, as he had exhausted the surplus at the disposal of his office in sending a delegate to the Archaeological Congress at Stockholm and a commission of astronomers to India to observe the transit of Venus. Professor Ascoli who, at the last moment, was commissioned to go to London, was unable to leave Milan owing to pressure of business.

WE hear that the question of the despatch of a Government Arctic Expedition will be discussed and decided at the first meeting of the Cabinet.

THE Learned Societies are beginning to meet. Among the earliest are the Shakespeare and Microscopical, of whose proceedings we gave a report last week. This next week the Quekett Club meets on Friday, the 23rd, at 8, when Mr. R. P. Williams will read a paper "On Cutting Sections of the Eyes of Insects, and on a New Instrument for that Purpose."

LITERATURE.

Rocks Ahead; or, the Warnings of Cassandra.
By W. R. Greg. (London: Trübner & Co., 1874.)

The three rocks upon which Mr. Greg fears that the national prosperity of England may split, are broadly described by himself as "1. The political supremacy of the lower classes. 2. The approaching industrial decline of England. 3. The divorce of the intelligence of the country from its religion." His warnings are only conditional, and the threatened evils may, he admits, be averted, at least in part, by timely precaution, but his fears are stronger than his hopes of such an event, and the general tendency of his auguries is at least as melancholy as their title promises. Most of the dangers which he signalises are real; and not the least of them, if indeed that be a danger, is the extreme improbability that resort will be had to the only class of remedies which he esteems efficacious. There is a curious resemblance between the tone and temper of a despairing Conservative and of a despairing Liberal, and Mr. Greg's philosophy of history reminds us strongly of Machiavelli's

"Et è, e sempre fu e sempre fia
Che l'mal succeda al bene, il bene al male,
E l'un sempre cagion dell'altro sia."

But this doctrine, never inspiring, seems peculiarly barren when the patriotic pessimist rests his remonstrances on the ground that it is the bad time which is coming next. Mr. Greg's conservatism is of the simplest kind, which consists in a belief that things were better yesterday than it seems to-day that they are likely to be to-morrow; but he hardly goes to the bottom of the question, which his admirable sense of the strict relationship between moral causes and effects should not have allowed him to ignore, what were the flaws or failings in the past good by reason of which it has produced, in direct descent, those effective tendencies which he denounces as dangerous or destructive. The Liberal creed, which assumes proposed changes to be for the better, escapes this inconsistency, however sombre its view of the actual situation may be, for reformers are not bound to exercise tolerance or piety towards the abuses which have nourished their zeal, at any rate until the zeal has proved successful. Of course every society, that falls short of absolute perfection, contains within itself many forces that may, and, in a more or less rudimentary shape, those which actually will, bring about its ultimate decline; but Mr. Greg's reminders of the general fact that national prosperities are not immortal are prompted by a special conviction, perhaps more open to dispute, that the forces which at this present time are gaining strength in English society are more dangerous to the welfare of the State than those of which the strength, absolute or relative, is

declining. Mr. Greg agrees with the Democrats and Secularists who believe their own opinions to be in the ascendant, and if the fact be so, his despondency is reasonable, for of course none but Democrats and Secularists can be expected to see in the development of their own principles the coming remedy to the prejudices and errors which cling to those parties while only half emancipated from the yoke of aristocratic and theological dominion. The misfortune is, that while his opponents look forward to applying new remedies to the evils that are young but growing, the only remedy that he has to propose himself is the old one of adjuring them not to grow, since the State will perish if they do.

His view of the "political rock," to take another maritime illustration, is that if the crew of a vessel discover that they are stronger and more numerous than their officers, they will break open the spirit-room, get drunk, and sink or strand themselves and their betters. Now, even admitting the officers of the old school to have been as much superior, morally and intellectually, to the men of the present, as Mr. Greg throughout assumes, he would scarcely wish the men to begin their political education by doubting the evidence of their senses as to their own number and physical strength. Other things being equal, the man who is aware that three millions (of electors) are more numerous than two millions is less likely than another to make the very obvious miscalculation attributed to the sailors; and if the working classes could not even count their own heads, Mr. Greg might well despair of their ever learning to weigh those of the rival candidates for their favour. His grievance, however, is not so much that the masses should gradually discover how much power they possess, as that they should be allowed to possess any political power at all. The House of Commons governs the country; the poor and ignorant many will elect a worse House of Commons than the prosperous and educated few, and accordingly the country will be governed in future a degree worse than indifferently. So far as we can understand, for Mr. Greg is not very precise in his indictment, the reasons for this inferiority are twofold. Even when they are sincerely anxious to choose the best man, large working-class constituencies will fail to do so from inability to rise to those broad views of public policy which distinguish, for instance, the ordinary reader of the *Times* or *Telegraph*: they will innocently and inevitably prefer the short-sighted and showy talker to the serious and reflective administrator; and even if they should accidentally select the latter, they will neutralise his merits by too close supervision of his acts. On this latter point, however, Mr. Greg is divided between a fear of the democracy and a fear of demagogues, and he does not determine which of the two (seemingly incompatible) dangers is most imminent, that the many will insist on mismanaging their affairs themselves, or that they will abandon themselves to the guidance of ill-chosen leaders. But—this is the second count—the working-class majority will not always be disinterested; it will endeavour, as other classes have done

before it, to promote its own interests by legislation direct and indirect; and something singularly like what Mr. Herbert Spencer calls "the class bias" leads the author to assume that the mistakes made by this class in pursuit of class-advantages will be more injurious to the general framework of society than the similar mistakes made by the Crown, the nobles, or the middle class, in former generations. The theory of government as a trial of strength between sovereign and subject, in which the vanquished bear the latter name, is not expressly advocated, but Mr. Greg is clearly of opinion that the material interests of the working classes are opposed to those of their social superiors, or he would not despair of seeing their confidence bestowed upon politicians who should endeavour disinterestedly to promote their advantage in connexion with that of the state at large. To give only one illustration out of many of the general temper of the book, the writer instances "less strictness in the interpretation of contracts" as one of the ends likely to be aimed at by legislation under the influence of the proletariat, the attainment of which would be economically injurious; but he fails to see that the working classes as a body can have no interest in the lax interpretation of contracts, unless those upon which they habitually enter are more advantageous to their employers than to themselves; if these conditions were reversed or equalised, so would be the desire for a strict interpretation; and it seems more important for the well-being of society as a whole that all classes should have an interest in keeping faith with each other than that the bargain of either one should be exceptionally profitable.

Of the "economic rock" of which the most fateful pinnacles are trades unions and the exhaustion of our coal-fields, Mr. Greg has not much to say that is at once new and practical, and he goes more into detail than is judicious in a prophet. He sees danger to the commercial supremacy of England on all hands: in the cheap labour of Germany and Switzerland, in the labour-saving inventions of the United States (commonly supposed to be connected with the high rate of wages in that country), in the general spread of social-democratic principles, in the competition of countries where absolute power has kept the proletariat docile, industrious and contented. In the former section he assumes that a democracy will be warlike because it can make all taxes fall upon the rich; but in the present he fails to consider another possibility, scarcely more remote, viz., that the international development of trades-unionism may modify the keenness of international competition so as materially to lessen the political importance of the ability to undersell. Mr. Greg recommends the working classes to be wise in time and renounce wasteful habits and immoderate desires before the coal is gone; the educated minority, whose unprofitable expenditure might also seem to require retrenchment, being, perhaps, relied upon to meet their troubles becomingly when they arrive, and England has to submit to the fate of a larger Holland. It is with regard to this distant future that the author's cal-

culations are dangerously minute. Without her political and commercial pre-eminence, England, we are told, will only be able to support two-thirds of her actual population, and we are not told what in that case becomes of the analogy with Holland, which certainly does not support a smaller population now than in the seventeenth century, and in fact, has a present increase not much inferior to Great Britain. If it were not for the figures, we should have supposed Mr. Greg merely to mean, what would be true politically, that the England of 100 years hence will be a poorer country than the England of to-day if it ceases to be as much richer than its neighbours; but precedent and analogy are against its becoming poorer absolutely, except by some great cosmopolitan revolution as yet unrevealed to Cassandra. Even in the famous "stationary state," to which Mr. Greg refers, we should suppose a small but steady increase of wealth and population proportioned to its progress in economy and improved methods of production, since the absence of such progress in a civilised community must be the first token of its physical and mental decline.

In religion Mr. Greg is less conservative than in politics, and therefore a shade less hopeless as to the future. He does not look upon atheism or scepticism in the upper classes as a public danger, and though he dwells on the difficulty of finding a substitute for the "police" influence of belief in future compensations, he insists less on the importance of fostering the belief where it survives than of redressing the hardships which might make its sudden abandonment dangerous. On this head also two of the tendencies which he notices with alarm may prove to neutralise each other in part, though, no doubt, the whole process is full of difficulty and risk. The divorce of the intellect of the country from its religion weakens the prestige of the religion even with the ignorant masses, who are subject to no other equally efficient moral influence, and are liable to be the worse for rejecting its control, as the interested invention of their social superiors; but in so far as they are led in their disbelief by superiors, recognised if not established, they are only transferring their loyalty, and tacitly admit the disinterestedness of new guides, who, happily, have by no means broken with the moral traditions of the past. The appendices, which take up about a third of the volume, relate mainly to the abuses of popular government in the United States.

EDITH SIMCOX.

Characteristics of English Poets from Chaucer to Shirley. By William Minto, M.A. (London and Edinburgh: W. Blackwood & Sons, 1874.)

To review a volume of aesthetic criticism with which one almost entirely concurs may be a labour most soothing and grateful to the moral nature of the reviewer, but it is hardly calculated to stimulate his wit or please his intellectual vanity. It is the apotheosis of that orchestral exercise known as "playing second fiddle." It is like rising to return thanks for a thoroughly able speech, or

holding a conversation with a very clever person, with whom one wholly agrees, and who has fairly got the lead in talking. It is true that a certain amount of pleasure may be found in practising that artless kind of self-praise that consists in saying that the opinions of Mr. A. are in the highest degree just and valuable, and that they coincide precisely with those of the present writer. But such artifices as these are too crude for practised pens, who prefer to denounce the incompetent from the Olympus of such erudition as books of reference may supply, or, having transferred to their own pages the pith of the book under examination, blandly to regret that it has not been more carefully revised, or filled with more durable matter. This satisfaction is denied to the critic who finds himself in the dilemma of saying nothing about a book or saying nothing but praise, and this is our own case in treating Mr. Minto's *Characteristics of English Poets*, a work that seems to demand almost unqualified, though of course not unmeasured praise.

At the outset it must be distinctly said that this is a *Tendenz-Buch*. It has a polemic motive and meaning, and that motive is wholly on what may be called the poetic side of the question. At first sight it might seem impossible that poetry could be treated otherwise than from a poetic point of view, but experience tells us that the perversity of prosy persons is illimitable in the opposite direction. Especially during the last few years the literary heavens have been darkened by strange and unfamiliar figures, bat-like and owl-like, who have filled our ears with the cries peculiar to their species, in which cries we have with difficulty perceived a variety of opinions on classic English poetry the reverse of poetical. Some of these good people have occupied themselves for years in stretching our old dramatists on the iron bed of a rhyming dictionary, others have foisted on our faith not one Chaucer but many Chaucers, and some have been found dull enough and yet insane enough to seek to load the already somewhat overladen shoulders of Bacon with the colossal glory of Shakspere. Against all these frivolous critics, who merely dim the splendour which they no doubt genuinely desire to illustrate, this book is even somewhat scornfully directed. One would be ready to assert that the author had read all the poets he characterises in the original quartos and folios, and never had seen a line of commentary or criticism, were it not that here and there a phrase or a reference shows that he has seen and read, and has passed over on the other side. Perhaps the main feature of the volume is its fearless independence of judgment, and its resolute disdain of the commonplaces that arose in the first instance from imperfect knowledge of the original works, and which, emanating from the mouth of a master, have been slavishly copied from handbook to handbook ever since. The hasty, unsympathetic, and often radically false judgments of Hallam may be especially quoted as an instance of this. It refreshes one's spirit to read the eloquent words (on p. 310) with which Mr. Minto does honour to the exquisite preciousness of Marlowe's *Hero and Leander*, a poem

that the sagacious Hallam, who probably had never read it, dismisses with a single contemptuous allusion.

It would be out of the question to follow the author step by step through his work. To do so would be to re-write the book. Suffice to say that it is thorough without being dull, learned and yet not pedantic, profound but at the same time amusing throughout. The opening chapter is naturally occupied with Chaucer, and among various points of interest which are discussed in it, the line of demarcation between the "gentles" and the "roughs" in the *Canterbury Tales* is dwelt upon at great length, the author being of opinion that the distinction between these two great classes must be very fully felt before we can realise how completely Chaucer understood the chivalric life of the educated classes and also the common talk of churls. In other words, if we suppose the Miller's Tale to have pleased the Knight, or to have been told in the hearing of the Prioress, we lose the whole dramatic force of the double representation. At most, the refined folks listened half incognito to the ribaldry of their inferiors.

To proceed, William Langland, who "wrote in the old English alliterative metre, but went to the fashionable modern poetry for the machinery of dream and allegory," is consequently treated after Chaucer. Gower follows, and meets with unduly severe stricture. The monotony and bulk of the *Confessio Amantis* seem to have worried the author into injustice; it is unfair to quote as an adequate sentence the monstrous charges brought against Gower by the witty and perverse Professor Lowell. It seems as though the time were really come when it is needful to speak up manfully for the poetry of Gower. At all events, by the side of the American critic's personal verdict I may be allowed to set my own. The *Confessio Amantis* has always been one of my favourite books; the soft, even flow of the octosyllabics, the frequent sudden felicities of phrase, the serene precision with which the stories develop themselves one by one, have combined to make Gower's poem one of those which rest nearest to my hand, and in which I most frequently dip for casual refreshment. Gower is neither sublime, nor animated, nor witty; he reminds one of a little quiet copse in one of the less picturesque English counties, a place where one enjoys an aimless ramble now and then, satisfied with the colour of the lichen on the boughs, with the mysterious sense of vitality and growth, and with such common but charming blossoms as the quiet change of the seasons can produce. The same thirst for fervid poetical excitement that has made the elegant master-pieces of the eighteenth century, the grace of Aken-side, the precision of Collins, intolerable to the present generation of readers, may account for the scorn with which most people nowadays regard Gower.

The chapter on the Elizabethan Sonneteers is perhaps the one which displays most prominently the delicate qualities of Mr. Minto's criticism. Almost every sentence in this section is weighty and suggestive. The composition of sonnets did not become a passion with the greater poets

till the last decade of the sixteenth century. Mr. Minto has not mentioned, nor am I aware that it has been pointed out, that as early as 1563 sonnets of a legitimate form—that is to say, poems of fourteen lines in heroic measure, ending with a couplet—were printed in English. These were in the poems of Barnabe Googe, a young person of much learning and no talent, who had just returned from Italy and Spain. When one recollects that Ronsard was publishing in 1552, in his *Amours*, sonnets as rich in thought and structure as those of Mr. Rossetti, the extreme baldness of our first sonnets is surprising; but it is perhaps stranger still that the beautiful French poetry of the middle of the sixteenth century—poetry that had received the mantle of inspiration from the fainting Italian muse—should have exercised no appreciable influence on English literature, except in the case of Spenser, who acknowledges his debt to Clement Marot, and might have been still franker. The epoch of good sonnet-writing in England set in suddenly in 1590 with the splendid lines, usually attributed to Sir Walter Raleigh, which precede the *Fuery Queen*. Then, as if awakened by that high clarion, there arose poet after poet, all gracious creatures of the courtly world of song, till at last, in 1598, Shakspeare himself came forward, and in a series of sonnets that outdid all others that the world had seen, finally conquered that form of verse also for poets of the middle class. For in literal truth the sonnet was at first the peculiar preserve of the grand seigneurs of the poetic craft; not fire-eating dramatists like Marlowe, nor Bohemian poets like Gascoigne, but scholars and gentlemen of refinement made use of it. Sidney first, and then Daniel; then the graceful and melancholy Constable; then Lodge, whose clear spirit, composed of fire and dew, scarcely could endure a heavier shrine than a short lyric or sonnet; then Watson, scholarly and uninventive, and the serious-minded Drayton; and last of all, Spenser, in his *Amoretti*. These men form a defined school, the presence and importance of which in our literature has hardly been acknowledged. Their sonnets were poured like incense on the altar of beauty; indeed, of some of them—of Constable, of Lodge—it might be said that their very being and personality were consumed in the ardour of their adoration. We scarcely know the personal individualities of any of these men; we judge of them as we find them in their writings: in one more tenderness, in one more fire, in another a more ethereal delicacy. The exquisite airiness and dewiness of this peculiar phase of English poetry give it an especial charm, and the rough lives of many of the predecessors of Shakspeare did not soil the purity of their writings. When Lodge, hopeless scapegrace that he was, had run away on a privateering excursion to the Canaries, the exquisite romance of *Rosalynde*, with all its inimitable lyrics, was crystallising in his brain; and when Greene was “quaffing, carousing and surfeiting all day long” with “the children of perdition,” the undercurrent of his mind was setting to that Arcadian shore where Isabel was sitting by the river-side, and Infida singing her pathetic “N’oserez vous, mon bel ami?” This

ideal condition of poetic expression was short-lived, as periods of extravagant ideality always are, whether Petrarch, Calderon or Wordsworth be the arch-idealist, and Marlowe broke in upon the Della-Cruscan sentiment of the later sonneteers with his healthily-masculine apostrophe:—

“I cannot cross my arms, or sigh ‘Ah me,’
‘Ah me, forlorn!’—egregious foppery!”

But these ten years of soft singing to the virginals had a powerful influence in forming the language and literature.

On the dramatists before Shakspeare, Mr. Minto is perhaps more original and more interesting than on those that followed. When he says of the work of Lyly that “the whole thing is a sort of ginger-pop intoxication, with airy bubbles of fanciful conceit winking all over,” that Nash is never worth reading “except when in the full swing of harum-scarum railery,” or that the superiority of Greene’s lyrical over his blank verse “surprises us as when an indifferent walker proves a light and graceful runner,” one is obliged to admit that the apparent flippancy of metaphor and phrase is in reality no lightness of judgment, but an intimate appreciation of the personal qualities of those men. The dramatic poets of those days were not gentlemen of fashionable habits; and the nearer one comes to the intimate knowledge of men like Peele and Nash, the less is one in awe of their presence. There is a fine couplet in one of the Roxburghe Ballads that well characterises them all:—

“A jolly young blade, who a light heart doth carry,
And cares for no thing but to have’s own vagary.”

To treat such a gay dog as Greene with dignity is absurd. To have laughed at them might have been dangerous—Marlowe wore a knife, and Peele had ugly habits—but at all events one must have laughed with them.

Everyone will read the charming chapters on Shakspeare, especially the masterly study of the sonnets, and the careful effort to realise what the personal appearance of the young poet must have been in the bloom of his adolescence. Ninety pages are devoted to what is necessarily a very partial and broken view of the prominent features of Shakspeare’s style, but in which the author contrives to say many true and some new things. The rest of the dramatists have to be hurried over in scarcely fifty pages, and this gives a sense of incompleteness to the end of the book. Nor are the sketches of the great playwrights in all cases satisfactory. The praise of Marston will seem to most readers excessive, the praise of Chapman to still more will be unintelligible. Mr. Swinburne will soon enlighten us on his own views of Chapman’s genius, and may throw light on what is still dark in Mr. Minto’s laudation. At present, I own myself, for one, to be wholly sceptical when I am asked to believe that the *Revenge for Honour* is “entitled to a high place among the works of the best tragedians.” The stiffness and wordiness of Chapman’s dramas seem to me to militate against the possibility of their enjoyment. The chapters devoted to Jonson and Dekker are excellent; the latter is evidently a man with whom the author has a warm personal sympathy; the judgment passed on Middle-

ton will surprise most readers, “Middleton’s genius was essentially comic and unromantic;” but, in spite of the often-quoted passages from the *Witch*, it is certainly as just as it is new. On Webster Mr. Minto is particularly inadequate, as may be seen in comparing his remarks with those on Cyril Tourneur which follow. The ingenuous reader would certainly suppose Tourneur the greater genius of the two, if he knew them both only from Mr. Minto’s description. Mr. Swinburne’s famous monograph on Ford is warmly praised, but with his usual independence of thought, the author finds some new things to say, even of the *Broken Heart*. Shirley finds little favour, and Heywood is, most unworthily, and this is perhaps the greatest blunder in the book, pushed aside into total contempt, alongside of Randolph and Rowley. It is remarkable that the only two poets for whose works Mr. Minto displays an utter lack of sympathy are the two great button-holers, John Gower and Thomas Heywood.

Enough has been said, it is hoped, to prove how very high the standard of criticism is which Mr. Minto has set before him, and how nearly he has attained to his own high aim. He will not, therefore, suppose that it is in any captious or ungenerous spirit that I venture to make one or two suggestions with regard to the plan he has adopted. In the first place the arrangement that gives more space to the period of renaissance and transition than to that of Shakspeare’s contemporaries and successors seems disproportionate, even in point of historic interest, especially as not one great poet, and only one second-rate, Wyatt, belongs to it. Secondly, the omission of the whole school represented by Father Southwell, Sir John Davys and Donne, is unaccountable in a work purporting to characterise the English poets down to Shirley. Southwell was executed two years before Shirley was born. Lastly, though plenty of space is devoted to the Scotch disciples of Chaucer, not one line is spared for the lyrists, for the three Alexanders, Scot, Montgomery, and Hume, for Sir Richard Maitland, or for William Drummond. To cease carping, a little more careful revision of the proofs would have made Thomas Rowley, William, would have named Marston’s poem “Pygmalion’s Statue,” and not “Pygmalion and Galathea,” as it stands, and would have made intelligible the quotation from Lodge’s *Wil’s Misery* on p. 344.

On the whole this is a charming contribution to the æsthetical literature of our country, and, as far as I am able to judge, no book since Hazlitt’s *Lectures* has approached it in the breadth and fulness of its judgments of old English poetry. It is to be hoped that the author is already busy on a continuation of his work.

EDMUND W. GOSSE.

UNDER the title of *Russian Romance*, Messrs. Henry S. King & Co. will shortly publish a selection from the *Tales of Belkin*, by the well-known Russian writer Pushkin. The following are the titles of these stories, which have been translated by Mrs. C. Telfer (née Mouravief):—“The Captain’s Daughter,” “The Moor of Peter the Great,” “The Lady Rustic,” “The Pistol Shot,” “The Undertaker.”

The Original Lists of Persons of Quality, Emigrants, Religious Exiles, Political Rebels, Serving Men sold for a term of years, Apprentices, Children stolen, Maidens pressed, and others who went from Great Britain to the American Plantations, 1600-1700, with their ages, the localities where they formerly lived in the Mother Country, the Names of the Ships in which they embarked, and other interesting particulars: from MSS. preserved in the State Paper Department of Her Majesty's Public Record Office, England. Edited by John Camden Hotten. (London: Chatto & Windus, 1874.)

THIS is in all respects a sumptuous volume, to the mechanical execution of which too much praise cannot be awarded. As it was avowedly prepared, and is now published, mainly for the transatlantic market, it was well that it should appear in an attractive form, in order that it may thus compensate somewhat for the disappointment its contents will inevitably produce. It is no secret that the volume has been extensively heralded in the United States, and the prospectuses, if they did not so state distinctly, conveyed the impression that it would contain transcripts of documents hitherto unknown or unpublished, which would throw great light upon the history of the early American settlers. Hence much anxiety has been felt by those who were induced to subscribe for the work on the strength of these announcements, which anxiety has not been allayed by the tardiness of the publication. More than a year ago, in answer to a personal application made at the publishers' office, it was stated that the work was then in the binders' hands and would be issued immediately. If the delay has been for the purpose of making the volume more valuable, of course no complaint can be made; but that, so far as American subscribers are concerned, may at least be questioned.

In the year 1860, the now venerable Samuel Gardner Drake, of Boston, who had been residing two or three years in England, engaged in historical and antiquarian researches, published a small and unpretending volume, under the modest title of *Result of some Researches among the British Archives for Information relative to the Founders of New England*. That volume contains, within the compass of about a hundred convenient pages, all that is in the more elaborate work before us which relates to the early settlers of New England, and most, if not all, of the lists of emigrants to Virginia and the West India Islands. Besides this, there have since been published, in the quarterly journal of the New England Historic-Genealogical Society, transcripts of other documents of a similar character, afterwards discovered in the Public Record Office, of which the present volume takes no notice whatever.

Instead, therefore, of obtaining new and important materials, as they were led to expect, the American subscribers to this work will find that they are merely duplicating the volumes already on their library shelves, and that no addition whatever has been made to the stock of knowledge which they already possess respecting their emigrant ancestors.

Under these circumstances, it is to be

regretted that the editor saw fit only to recognise Mr. Drake's labours by a single line in the Preface, stating that in 1860 he published his volume. The fact is, that the credit of first giving these interesting and important lists to the world is due solely to Mr. Drake, and it would have been both modest and prudent to have paid a little more respect to one who is venerated as a Gamaliel among American antiquaries.

If it were assumed that Mr. Drake's version of these lists is imperfect or incorrect, then a perfect and correct reprint of them would be not only justifiable, but highly commendable. No such assumption, however, is made, and it is only by a careful examination of the two versions that certain discrepancies are detected, to which it may not be amiss to direct attention. It is hardly necessary to say that the value of such lists depends upon the accuracy with which the originals have been transcribed and printed. If they are not faithful transcripts they are worse than valueless, because they will mislead those who consult them. In the present instance the question of accuracy is fairly raised, because the discrepancies are numerous and often very important. The following will serve to show their character. They are all surnames, and are thus differently given by the two transcribers:—

Page	Hotten	Drake
54	Winckoll	Winchell
59	Backley	Buckley
"	Battrick	Buttrick
60	Longe	Lougie
62	Gibson	Gilson
72	Haies	Haus
76	Hall	Hull
87	Tasellie	Tusolie
92	Halliack	Holliock
107	Steerer	Steeer
"	Burles	Burtes
108	Burles	Burnles
"	Spratt	Sprall
131	Streme	Sterto

This list might be indefinitely extended, but is sufficient to show that there have been fatal misreadings on the part either of Mr. Drake or Mr. Hotten. If Mr. Drake was in fault, the correction of these fourteen surnames would entitle Mr. Hotten to the gratitude of those interested in them. If, on the other hand, Mr. Hotten blundered, then the printing of these fourteen names erroneously throws great doubt upon the accuracy of the rest of his volume. Certainly, *Longe* seems more likely to be right than *Lougie*, *Tasellie* than *Tusolie*, and *Spratt* than *Sprall*; but how is one to decide between such discrepancies as *Buckley* and *Backley*, *Gilson* and *Gibson*, *Hull* and *Hall*, and especially *Sterte* and *Streme*—all being equally legitimate and reasonable names? It is, of course, not impossible that Mr. Drake may have been in some instances unable to decipher a letter or a word, but it will be found, on examining his book, that, whenever a doubt arose, he sought capable assistance, and finally adopted the orthography agreed upon by the experts at the Record Office. It must also be remembered that Mr. Drake took a deep personal and national interest in the work in which he was engaged, and was impelled by every possible motive to secure perfect accuracy in his transcripts. He had been engaged all his life in historical and anti-

quarian pursuits, and was as familiar with the chirography of the period as, to say the least, any professional copyist of the present day. Two or three instances of misconception occur in his volume, arising from his lack of thorough acquaintance with the old trades and professions, and their designation by terms different from those in use in his own country; but, so far as the names of persons are concerned, it would be unwise on the part of Americans to reject his nomenclature and accept the new one until the latter has been proved to be correct.

There are several instances in which Mr. Hotten's version renders good service, and it is but just that these should be specified. On page 77, against two of the names, he appends the description "2 maid servants," and this Mr. Drake omits. Trifling as this may appear to the non-genealogical mind, this addition gives the two persons named a distinct position, and removes them from the possibility of being connected with families of the same names of a higher social grade. On page 55, and in one or two other cases, Mr. Hotten describes as "carriers" persons distinguished by Mr. Drake as "curriers," and the former is probably correct. Also, Mr. Hotten classes as "sawyers" those whom Mr. Drake took to be "lawyers," and here again Mr. Hotten is undoubtedly right. This correction is extremely important, because, according to the transatlantic conception of these terms, it at once transfers the individuals so described from about the highest to about the lowest social rank. Again, on page 130, Mr. Hotten describes one Isaac Heath as a "Harnis Maker," whereas Mr. Drake had read "Harms Maker;" and it is amusing to find him defending his version in a foot-note by assuming that the Cockney aspirate had found its way into the chirography of the period. Of course an *arms maker*, as Mr. Drake translates the term, would in England have been described as an *armourer*. But even in this case Mr. Drake proves how carefully he scanned every word, for he says in his note, "The MS. is clear as I have copied it." The letter *i* was evidently not dotted, and hence his difficulty; but there is no doubt that Mr. Hotten correctly adopts *harness maker*.

Against this very excusable difficulty of Mr. Drake's may be set two for which Mr. Hotten, or whoever wrote the foot-notes to the present version, can hardly be excused. On page 78, against the name of Thomas Whitton, occurs the description "brover," which, either accidentally, or because it was inexplicable to him, Mr. Drake omitted altogether. The foot-note reads, "meaning not clear." Did the writer never hear of "broad weavers"? Again, on page 87, where the minister of "Thisselworth" is mentioned, a foot-note reads, "Is it possible that this is intended for Isleworth? I can find no Thisselworth." Any respectable antiquary would simply reply, Is it possible that it is intended for anything else?

As has been said, the portion of this work important to Americans has already been compressed within the limits of a small and convenient volume, and, although it was prepared for and is somewhat ostentatiously

dedicated to them, the rest, and by far the larger portion of it, may be at once dismissed as of little or no value to them. The lists of transported rebels sold to the planters in the West Indies, and the Barbadoes documents generally, possess no more interest than would similar ones relating to any other and more distant British colonies. This portion of the volume, however, was well worth publishing for home use, and if Mr. Hotten, or his representatives, had not attempted to beguile the American public with a reprint of Mr. Drake's book, but had announced and produced a volume of important genealogical collections, there would have been no complaint to make, and no reason why these *Original Lists* should not be commended as worthy of a place in every public and private antiquarian library in England and elsewhere. It is against the unfair treatment of the American public that this protest has been made, and, having made it, we may now speak of the volume as it really deserves, with reference to its circulation at home.

Although Mr. Drake's book is widely distributed in the United States, it would probably be difficult to obtain it in England, and therefore its reproduction here is not only justifiable but creditable, while the addition of the other lists and official documents, of considerable though perhaps not equal importance, renders the ponderous volume before us one of the most interesting contributions to the department of Historic-Genalogy that have ever been issued in this country. From these apparently dry columns of names may be gleaned data that will fill a hiatus in many a family history. These thousands of names are those of English men and English women who, literally taking their lives into their hands, went forth into then almost unknown regions, fearless pioneers in an enterprise that created another England, and perpetuated the English name and character throughout another continent. It is fitting that their memory should be preserved, for, whatever the motives that first induced their exile, they were the instruments of greatly enhancing the glory of their race and country.

After the lists of the New England emigrants, next in interest will be those relating to Virginia, and of these, perhaps, the most important are those which give the names of the settlers who were living in that colony in February, 1623-4, and of those who had died previous to that date. Another list, a year later, shows the changes which had taken place during the twelvemonth.

The records relating to Bermuda and to Barbadoes will be found of great interest, though chiefly of a later date. It is something to know who were living at Barbadoes two hundred years ago, how many children, hired servants, bought servants, and slaves, each possessed, and how many acres of land they owned. These facts, as well as an official record of all the baptisms and burials that occurred there during a period of eighteen months, will be found in the very handsome volume before us.

One familiar with American history and biography can readily recognise, on almost every page devoted to the American emigrants, the ancestors of men who have since

risen to eminence, and whose names are household words. Surely it is not time wasted, nor sympathy and sentiment misapplied, when, taking almost at random a name from these pages, one looks down the long line of years, and, at the end of two centuries or more, finds at one extremity an emigrant "husbandman," and at the other, in direct descent, a well-known divine, statesman, or perhaps president. The lesson thus taught is a practical and pertinent one; for, in no civilised country that is not English, or has not been English, can such an experience be found.

This volume is, to all intents and purposes, an English Family Record, and as such may be commended to English families, and the descendants of English families, wherever they exist.

JOSEPH LEMUEL CHESTER.

Journal of Henry Cockburn, being a Continuation of the Memorials of His Time, 1831-54. In Two Volumes. (Edinburgh: Edmonston & Douglas, 1874.)

Letters chiefly connected with the Affairs of Scotland, from Henry Cockburn, afterwards Lord Cockburn, to T. F. Kennedy, M.P., afterwards the Right Hon. T. F. Kennedy, with other Letters from eminent Persons during the same Period. (London: W. Ridgway, 1874.)

THOSE who remember Lord Cockburn's *Memorials* will take up the continuation of them now published with great expectations, and we very much fear the book will disappoint them. It was impossible, however, that it should be as interesting, or have the same kind of interest, as the earlier work. Scotland was Scotland in 1800. By 1830 it had been in a great degree assimilated to the sister country, and the process of Anglicisation was in rapid progress during the period over which the *Journal* extends. The *Memorials* mainly owe their interest to a state of manners which, even in Cockburn's boyhood, was vanishing—the manners of a society in which whimsical persons and humourists abounded—a society presenting odd contrasts, not without polish, for example, yet wanting in refinement, and given to a terrible plainness of speech, combining a certain stateliness and love of form with an irrepressible tendency to high jinks. The most curious specimens of this curious society are preserved for us in the *Memorials*, and go far to make it the delightful book it is. For the *Journal* such materials were only to a slight extent available; and, though Cockburn made the most of them, they were not enough in quantity to impress a character upon the work. It for the most part deals with passing political and ecclesiastical events, and it has therefore, for the most part, just the kind and degree of interest which belong to the comments upon such events of a sagacious and sound-headed observer. This is not saying much for it; and it should be added that a great deal of space is bestowed on matters which must be somewhat languidly regarded out of Scotland. There are, for example, frequent and lengthy notices of the reform of the Scotch law; and the con-

troversies which broke up the Scotch Church in 1843 occupy a large portion of the two volumes. The importance of such subjects is not to be gainsaid, but they are scarcely what one has learned to look for in a book bearing the name of Henry Cockburn. Not that politics are ignored in his earlier work. But even the politics of Scotland had something astounding about them in the early part of this century, and in Cockburn's presentation they are dwarfed by the strange personalities which are seen mingling in them. The notices of his friends and neighbours, which he put into his *Journal* as, one after another, they died or got promotion, are what chiefly show the peculiar abilities displayed in Cockburn's previous works; but most of these relate to persons of merely local note, and persons, it must be said, of a tamer breed than the eighteenth-century heroes of Cockburn's youth.

Of the letters to Mr. Kennedy, which have been published almost simultaneously with the *Journal*, the chief thing to be said is that they have been published without the authority of Lord Cockburn's executors, and that by them the publication is regarded as a breach of confidence. It is easy to understand their annoyance. The letters are hastily-written notes about political affairs, the interest of which has passed away, and they have no historical value. Nearly a third of them belong to the Reform period, and, in fact, disclose the workings and shiftings of Cockburn's mind as to the details of the Scotch Reform Bill. Those of earlier date are almost wholly concerned with projects for the improvement of the law of Scotland, which Mr. Kennedy, counselled and prompted by Cockburn, attempted to carry in the House of Commons. Of the matters dealt with in these letters, Cockburn, showing his habitual discretion, disposed in a few pages of his *Memorials*—saying extremely little, too, of either Mr. Kennedy or himself in connexion with them. Then, while it is evident that the pruning-knife has been freely used upon the letters—otherwise, they must have been more amusing than they are—many passages and expressions have been preserved which Cockburn's friends would certainly have obliterated. The publication of the letters in which Jeffrey's failings in the management of public business are candidly discussed—letters necessary to be written—would have pained Cockburn intensely; and it is not possible he should have liked it to be generally known that he habitually wrote of Lord Moncrieff, whom as man and judge he much esteemed, as Creeff. Of such errors of non-omission there are in Mr. Kennedy's volume quite enough to cause vexation to Lord Cockburn's literary executors. Perhaps, however, they have been treated too seriously. As for Mr. Kennedy, it is plain that he has been thinking mainly of himself, regarding Cockburn chiefly as a means of recalling himself to the memory of the world in which he once felt himself of some use and importance. Old age has its privileges, and even those who hold the charge made against him to be proved must admit extenuating circumstances. Cockburn, at any rate, does not suffer by his publication, for in nearly every page of it we

have evidence of his good sense, good nature, and public spirit.

What the *Journal* discloses as to Cockburn himself can be very shortly stated. At the date at which it begins he was Solicitor-General for Scotland, under Lord Grey's administration, Jeffrey being Lord Advocate. He became a Lord of Session in November, 1834. In 1843, he passed into the Second Division of the Inner House of the Court of Session, and there he remained till his death in 1854. As Solicitor-General, his most important task was the preparation of the Scotch Reform Bill, which, however, underwent extensive alterations after passing out of his hands. As a judge, the most important cases he had to deal with were the Church cases which led to the Disruption of the Church of Scotland in 1843. In these Cockburn took the popular or Free Church side, and he held to it very strongly. It is obvious that he regarded the Scotch ecclesiastical controversy as out of sight the most important matter with which he had ever had to do, and, indeed, as among the most important things in modern history. About himself and his own affairs Cockburn is properly reticent. No chronicler ever supplied fewer materials for the biographer.

The ecclesiastical controversy which interested Cockburn so profoundly that it is the most prominent thing in his *Journal*, precluded the failure of a curious experiment. The most important aspect of it can be briefly presented. If Cockburn be right, the Scotch Church, as it was before the decisions which led to the Disruption, came nearer to Cavour's conception of a free Church in a free State than any other institution we have ever read of. It was a separate power, with courts possessing an extensive jurisdiction, which they exercised in complete independence of the ordinary tribunals. From the judgments of these courts on questions of doctrine or discipline there was no appeal to the courts of law. In all properly ecclesiastical or spiritual matters they were supreme, even when material interests were involved, in them—though the right of the Civil Courts in certain cases to come in to dispose of such interests seems to have been admitted when once it had been asserted. The induction of clergymen into livings, and the deposition of clergymen from the office of the ministry which involved the loss of their livings, were, on this view, matters in which the Church Courts were absolutely unfettered. These Courts also claimed a right of legislating within certain limits in matters concerning the interests of the Church. It was the exercise of this right which brought them into collision with the Court of Session, the limitation of patronage being the object of the untoward piece of legislation—known as the Veto Act—out of which came this result. The Court of Session, on being appealed to, declared the Veto Act illegal, held that certain clergymen who had been in terms of it refused institution to livings were entitled to be inducted into them, required the Church Courts, under the penalties of contempt, to induct them, and when certain other clergymen for obeying its mandate in opposition to that of the

General Assembly, had been deposed by the Assembly, intervened to prevent effect being given to the sentence. Here were the ancient rights of the Church set at nought, the liberties believed to be inherent in her as a church, as well as conceded to her by law—her "spiritual independence"—encroached upon, her former position within the State destroyed. A violent popular agitation arose, and the State refusing to undo what the Courts had done, the great secession of 1843 occurred. More than half the people of Scotland are said to have left the national church. Nearly a third of its ministers threw up their livings—to the infinite astonishment of the Government of the day, which had trusted fondly to the restraining influence of loaves and fishes. Their self-sacrifice, which certainly made a great impression on the world, made Cockburn aglow with admiration. He speaks of it as almost without a parallel, as an occurrence of the kind rarest in moral history. That the secessionists were right in law he had not the shadow of a doubt. The Star Chamber, he says, never encroached more flagrantly upon the common law of England than the Court of Session did upon the legal rights of the Scotch Church. The ablest lawyers of Scotland, too, were of the same opinion. Supposing their view correct, the matter for wonder is that the Church should have held its independent position so long, rather than that it should have had at last to pass under the yoke of the State.

A slight concession in regard to patronage might have averted for an indefinite time the conflict between Church and State, and after the Disruption of the Church, concession was made in an Act prepared by Lord Aberdeen. This measure was undoubtedly framed with the intention of maintaining patronage, and, in appearance, conceded very little; but it worked in such a way that patronage soon became practically worthless, and during the present year it has been abolished. Cockburn gives another rather striking illustration of the quality of the same statesman's political foresight. The unlimited entail of land which prevailed in Scotland had been during twenty years hotly assailed by law reformers without the least effect. Its warmest friends, however, perceived that it carried with it some inconveniences. Lord Aberdeen undertaking to rid it of these, and put it into good working order, with one stroke ensured its destruction. He procured for heirs of entail in possession—much to their satisfaction—a limited right of burdening the land with provisions for younger children. No sooner had this been done, than it was observed that in a few generations the subjects of entail must be eaten up for such provisions. The Act, too, was so convenient to entailed proprietors, that they soon desired to have the precedent set by it followed, and they succeeded. The process of extinguishing entails thus accelerated, the unlimited entail was by and by with universal consent given up, and the Scotch law assimilated to that of England. The thoughtless tampering of an eminent admirer thus destroyed an institution which would have stood firm to this day against hostile attacks.

Cockburn has supplied us with elaborate

accounts of the leaders of the Scotch Church, and of the distinguished contemporaries, lawyers and politicians, with whom he lived familiarly in Edinburgh. These, however, are too long to be quoted here; and, in truth, painstaking and judicious as they are, they do not delight us like the careless, rapid sketches thrown off without a thought of responsibility, of which the *Memorials* are full. Oddities, indeed, suited Cockburn best; and some of his greatest successes have been made with peculiar people who were perfectly obscure. For Dr. Chalmers he had a profound admiration and affection. The secret of Chalmers's wonderful oratory, he says, was intensity of manner, for most of his speeches could be read without emotion. "It is only," he adds, "when his feelings are brought out in his emphasis, in his views, in his curious sentences, in his lofty objects, and in the general look and air of the speaking man, that his oratory can be understood." "How he burns," Cockburn goes on: "I shed more tears of pure admiration than I have done since they were forced from me by the magnificence of Mrs. Siddons." And yet this impassioned orator not only carefully prepared his speeches, but delivered them from notes. There was a strong affection between Chalmers and Jeffrey also. Cockburn says that on one occasion Jeffrey had let drop something which Chalmers took for a confession of infidelity, but that instead of starting off in horror, or answering by abuse, Chalmers drew to him more gently than before. "He behaved as gently to me ever after," Jeffrey told Cockburn, "as any mother to a sick child." Of Jeffrey, Cockburn says that "head and heart included, his was the finest nature I have ever known." He was prepared for Jeffrey's failure in the House of Commons. "Nearly sixty years of age, a bad trachea, inexperience, and a great reputation" were conditions, he thought, fatal to success in that assembly. But Jeffrey's failure was more signal than he had expected it to be, more signal perhaps than the world would ever have known it to have been but for the publication of Cockburn's letters to Mr. Kennedy. The good in him seems to have been largely answerable for his mistakes. "He is too pure himself," Cockburn writes to Mr. Kennedy, "to suspect others. But he is very docile, and grateful to every teacher. Just tell him to distrust words and villains." Everybody near him seems to have managed him, but he was found more docile by political opponents than by political friends. Cockburn's exhortations to Mr. Kennedy to put up with any and everything from Jeffrey were incessant. "There is no man," he says in one place, "to whom more kindness is due, or on whom kindness is less wasted. I don't hold out to you the hope that anything you may do will save you the agony of his habits or defects. But while we curse his failings we must patiently and good-naturedly manage them to the best advantage." In a very different tone does Cockburn write of Jeffrey's lifelong friend, Lord Brougham. "The least amiable man," he calls him in the *Journal*, "and I think not entertaining, but only because I cannot be entertained where there is a constant dread of some explosion, for

what he says is always curious and powerful." In one of his letters to Mr. Kennedy, where, by the way, Brougham is always spoken of as the Evil, or the Evil Principle, Cockburn reiterates this, and describes Brougham as the least great of all eminent men. When he came to write the life of Jeffrey, Cockburn was much perplexed as to what he should do about Brougham (who was then alive), and in the end he resolved to say nothing about him. "What a fact," he writes to Mrs. Kennedy, "in the history of that man, that the lives of four of those with whom his history ought to have been intermingled—viz., your father [Sir Samuel Romilly], Mackintosh, Horner, and Jeffrey—have now been published, and he cast out of them all." A damning fact, indeed!

Cockburn, though a Liberal from his youth, and disposed to be hopeful about the future of the race, could not restrain an occasional sigh over the progress of what we call our civilisation. The political changes which he had witnessed—and there had been vastly more change of this kind in his time in Scotland than in England—seemed to him purely good, though the modes by which they had been procured did not always meet his approval. But as for manufactures, he seems to have thought we could get on with less progress in them; to him they meant a deteriorated population, and a great increase of pauperism. The modernising of the Court of Session into a business-like machine for the dispensing of justice, too, he could not help deploring, though he knew it was not to be resisted, and did not seriously disapprove of it. But the six months of vacation—"our two months in spring, the long glories of the four months in summer and autumn"—had given the Scotch Bar the greater part of the literature which adorned it; eminent Scotch lawyers had been also eminent men of letters, because they were not "worked out by nearly constant toil, or vulgarised by law being the chief object of their lives;" and it is intelligible that Cockburn should regret a system which, whether it suited the public or not, had worked well for law and letters too. The change of which he saw the beginning has not yet proceeded very far; but already the literary character of the Scotch Bar has fallen a victim to the division of labour. Jeffreys and Cockburns are no longer to be found among its successful practitioners. But there may be something to be said for the division of labour nevertheless; and, certainly, there is no lack in our time of men who dabble in literature.

D. MACLENNAN.

Memoirs of Bartholomew Fair. By Henry Morley. (London: Frederick Warne & Co., 1874.)

WEST SMITHFIELD is historical ground, and associated with much that is most interesting in our national annals. It was originally a marshy piece of ground outside the city walls, which was used as the king's market, as well as the recreation place of the Londoners. Tournaments and jousts were held here for one or two centuries, and the highway to the field, along which the knights and ladies rode, was called Knight-riders or Giltspur Street. In the year 1357

the kings of England, France and Scotland were spectators here of a magnificent display of chivalry. At a later period, in Edward III.'s reign, the King's mistress, Dame Alice Perrers, rode to the lists as Lady of the Sun; and in May 1390, Chaucer, as Clerk of the Royal Works, was employed in setting up scaffolding for Richard II. and his queen (Anne of Bohemia) to see the jousts.

This is the brilliant side of the picture; but there is also a particularly dark one, for Smithfield was used as the burial ground of the plague-smitten; and the city gallows, where Mortimer and Wallace were executed, was erected under the elms which grew in one part of the field. Later in time the Smithfield fires were lighted to burn unfortunate heretics, and a piece of ground opposite the entrance to Great St. Bartholomew Church was for many years loaded with the bones of martyrs. One of the first of these was John Bedby, a tailor, who was burnt in the year 1410; and the last, Bartholomew Leggatt, a Unitarian, in 1611. During the two centuries that passed between these two extreme dates, many whose names are now honoured suffered death on this spot.

Not the least interesting of the associations of Smithfield are connected with the fair, which was held here for seven centuries, and which has only faded away within the last few years. It now lives again in Professor Morley's exhaustive history.

In order to understand what fairs were on their first institution, it is necessary to divest our minds of the impression made by the foolish and often worse than useless things they are now. Formerly they were representations of the world in little, and a complete account of them would illustrate history in a remarkable manner. The first fairs were formed by the gathering of worshippers and pilgrims about sacred places on the feast-days of favourite saints, and the tolls gathered by the abbots and bishops were no insignificant sources of revenue. The grant of these tolls from the Crown was a concession of some value, and when religion threw the mantle of its protection over the commerce of the time, it was amply rewarded by the money it received in return. Fairs for several centuries were the chief resorts of trade, and all tradesmen in the neighbourhood of them were compelled to shut up their shops while they were open. Amusements were introduced in order to add to the attractions of the fairs, and to induce the rich and idle to resort to them.

Professor Morley has here occupied virgin soil. Sixteen years ago, when his book was first published, no author had thought the subject of fairs worthy of his attention. It is only those who have tried to weld into a homogeneous whole the miscellaneous collections that exist on such a subject as this, who can estimate the labour which has been expended to produce the book before us.

Rahere (or Rayer), sometime jester to Henry I. and then a monk, was the founder of the priory, the hospital, and the fair, which were all dedicated to the honour of St. Bartholomew the Apostle. After his conversion he journeyed to Rome, and on a certain night St. Bartholomew appeared to

him in a vision, and instructed him where to build a church and monastery. On his return he went into Smithfield, and, making friends with the children and servants who congregated there for recreation, he obtained their help in gathering together stones and other things profitable for the building and for the filling up of the fenny marsh. Rahere was clever in the conception, and highly successful in the execution, of his great undertaking, for he obtained charters from the King, and St. Bartholomew assisted him with miraculous cures. He died in 1143, having been prior of his Black Canons for more than twenty-two years. Mr. Morley is rather severe when he calls him a lay jester transformed into a clerical juggler.

The fair of St. Bartholomew appears to have consisted of two distinct parts. Within the churchyard of the priory, on the site of the street now called Cloth Fair, were the booths of the clothiers of all England and the drapers of London, and every night the gates were locked and watched for the safety of the wares exposed for sale. Without the gates the pleasure-givers and pleasure-seekers met. In course of time the priory was suppressed, and the hospital became the all-important institution. Houses were built in place of booths, but the fair still had vitality, and continued to exist as a popular resort. When the religious houses were being divided among the courtiers, Sir Richard Rich purchased the priory for 1064*l.* 11*s.* 3*d.*, and made the prior's house into his own town mansion. He and his descendants or representatives received tolls for that part of the fair held within the parish of Great St. Bartholomew's until the very last days of the fair. As early as the year 1445, the City obtained the right of receiving the tolls arising from the use of the ground outside the priory.

The literature of Bartholomew Fair is large, but of little value; it contains, however, one work of genius, viz., Ben Jonson's play of that name, which was acted before James I. in the year 1614. Here all the chief characters and incidents of the fair are vividly painted, and the picture is of great value in bringing before us a bit of London life in the olden time. It is not a very pleasing picture, but the student of manners must not be over-nice in his taste. Justice Overdo is the representative of the judge of the Pie-powder court, that court which was set up in every fair for the purpose of obtaining prompt justice; and Captain Jordan, of the roaring horse-courser, who bought and sold horses already in use, in contradistinction to the horse-dealer who traded in horses of his own rearing and training. Old Ursula is a distinctive character of the fair, and her pigs were long a favourite dainty. The enormous sale of pig-meat came to an end about the middle of the last century, and beef sausages replaced roast pork. Mr. Morley points out that the sale, century after century, of certain forms of cooked meat was partly a continuance of the custom of feeding large numbers of visitors that arose out of the necessities pressing upon the fair when it was first established.

In old times the country was continually visited by the plague, and during these

periods any large gatherings of people were peculiarly dangerous, so that we find the fair suspended in 1593, and again in 1625, 1630 and 1665. Bartholomew fair was not suppressed by the Puritans, and it held its own while the play-houses were silenced. During the Commonwealth the city, acting by its Lord Mayors, made several attempts to put a check upon the freedom of the fair, and thus offended the populace, giving occasion for the formation of Lady Holland's mob, which for many years did its own will and set constables at naught. Mr. Morley prints a broadside entitled *The Dagonizing of Bartholomew Fayre*, on account of its connexion with the origin of Lady Holland's mob; but as the copy which he used was torn upon one margin, and had lost some rhymes from the second column of the verses, he has inserted conjectural words between brackets to the extent of thirty lines. Now this broadside is not so rare as Mr. Morley seems to think, for it was reprinted some thirty years ago from a perfect copy, and we are therefore able to see that all his emendations are wrong. The verses are not of enough interest to induce us to quote them entire, but we will give the end as a specimen. Mr. Morley prints:—

“But when his Lordship looked on high,
John set up thien a devil's cry,
And glad he was to see him fly,
So was Mr. Finis.”

The correct reading is:—

“But when his Lordship left the fayre,
John set up throat did rend the ayre
And glad he was, he loud did sweare,
he was gone,
So was Mr. Finis.”

The natural period of the fair was three days; that is, the day of assembling on the eve of the feast, the feast day, and the day following; but at the Restoration its duration was extended to a fortnight, and at one time even to six weeks. Various attempts were made by the City to limit it to the original three days, and in 1750 they were successful. Three years after this the alteration of the calendar changed the month of the fair, and St. Bartholomew's day fell on September 3, instead of August 24. The Lord Mayor opened the fair with a proclamation from an early period, and Paul Hentzner, who was visiting our sights in 1598, greatly admired the civic magnificence. The Mayor was usually content to make his proclamation and retire, but Wilkes drove round the entire circuit of the booths in his state coach.

When all the world, both high and low, went to the fair, it was a good representative of public opinion, and the sentiments of the masses were echoed by the various showmen. At the time of the Popish plot a play called “the Coronation of Queen Elizabeth, with the restauration of the Protestant Religion, or the downfall of the Pope,” was played every half-hour to a gaping and admiring crowd, and at a later date a representation of “the glorious battle obtained over the French and Spaniards by the Duke of Marlborough” was added on to the *Creation of the World*. Money was to be made at the fair, and good actors did not disdain to amuse the public at the “great theatrical booths.” Thomas Doggett, the famous comedian and one of

the managers of Drury Lane Theatre, kept a booth, and Joe Miller, Mrs. Pritchard, and Mrs. Cibber all acted in the fair; but Ned Shuter was the last actor of note who appeared upon the Smithfield boards, and after him the place was given over to the puppet-shows, and to such dramatic talent as was to be found at Richardson's theatre. A greater name than any of these remains, however, to be mentioned, for the great novelist, Fielding, conducted a dramatic company during fair-time for several years, and acted himself.

The celebrated rope-dancers, merry and jugglers of many generations, all exhibited themselves at Bartholomew Fair. Strange and wonderful creatures were always numerous. Giants and dwarfs, animals with twice their proper quantity of legs, elephants that could fire guns, learned cats, and pigs that could tell fortunes, were highly attractive at all times. Pidcock's wild beast show, which consisted of animals brought from the menagerie at Exeter Change, was the great attraction in the last century, and in the present century Wombwell took Pidcock's place.

Long before the fair was cleared away, it had become a nuisance, and all respectable persons hoped to see the yearly riot abolished. At the beginning of the century mobs of pickpockets surrounded helpless women and tore their clothes from their backs, and every thief living in London regarded Bartholomew Fair as an annual performance for his especial benefit. Still it was allowed to die out. The City raised the rents higher and higher, until nearly all the exhibitors ceased to apply for places, and in 1849 the fair consisted of a dozen gingerbread stalls.

In 1850 the Lord Mayor went to proclaim the fair as usual, but found that there was none worth proclaiming, and after 1855 the little remnant that still lived on ceased to exist. The fair died of contempt, and it is far better to make its acquaintance in Professor Morley's volume than to have seen it in the flesh. HENRY B. WHEATLEY.

Le Duc de St. Simon, son Cabinet et l'Histoire de ses Manuscrits, d'après des Documents authentiques et entièrement inédits. Par Armand Baschet. (Paris: Plon, 1874.)

THE Memoirs of St. Simon hold a unique place among the sources of French history, and form a singular contrast to the narratives of the official historiographers of the time. They spare nobody, and their free and easy style is that of a book written in the presence of the actors on the scene, who sit for their portraits, knowing nothing about the matter. What life those portraits have! What passion is expressed in them! Sometimes, it must be acknowledged, it is the passion of the author which he has imparted to his subjects, and against this defect criticism ought to be on its guard. But life is always there, and the reader is, as it were, drawn into the midst of the action.

It is not of this, however, that we have to speak here. The book which we are noticing is, to a certain extent, only a history of the MSS. of this history, and St. Simon's work is of such importance, that we can understand a man of learning making

this the object of his investigation, and thinking it of such importance as to excite the curiosity of the public.

The author of the present work resolved to enquire through what fortunes and vicissitudes these papers, the loss of which would have left so great a gap in the history of Louis XIV. and the Regency, have come down to us; and he has proceeded to lay before us in the fullest detail the results at which he has arrived. Have we already in a printed form all that St. Simon wrote? Are there not still in the public repositories other MSS. of the same author which must be equally interesting? Do we, in short, want more than the *fiat lux* of the authorities who have the custody of these documents to enable us to penetrate with the help of the piercing eye of that pitiless observer into some part of the history of his time which has hitherto been veiled in secrecy?

M. Baschet introduces us to the hotel of the Rue de Grenelle before “the four-post bed hung with yellow damask, bordered and crossed with silver lace,” in which the commissary of the Châtelet found “a dead body, which was, as he was told, that of the Duke of St. Simon.” He then brings before us the notaries and the lawyers following one after the other; he makes us look on at the sealing up of the effects of the deceased, and at the breaking of the seals. The reader will perhaps hold very cheaply some of the documents of which the editor has not spared him a syllable from very delight at having discovered them. It is sufficient to know that they are in the hands of M. Rouget, who is the present successor of M. Delaleu, the Duke of St. Simon's notary. The important fact is that St. Simon bequeathed his MSS. and papers to his cousin, the Bishop of Metz. But the Bishop had some difficulty in getting possession of them. St. Simon, just like the rest of the *grands seigneurs* of the Regency, was deeply in debt. All his property was mortgaged to his creditors, who received the revenues on condition of leaving to him a yearly income on which he lived. As soon as the Duke died, these creditors wanted to know whether the sale of his property would be sufficient to pay them off, and this was the reason of the minute inventory taken of the furniture of the hôtel in the Rue de Grenelle, and of the Château de la Ferté-Vidame, in Perche, his principal residence. As the Bishop of Metz insisted on entering upon the possession of his legacy, fresh proceedings ensued, and in the end an order of the Parliament directed a special inventory of the MSS. to be made, in which each article should be separately named (May 10, 1755). This inventory gives us the description of the papers of every kind which the Duke had in his library. The mere arrangement of the MSS. took up fourteen “vacations,” of seven days each. The catalogue, which was the result, contains no less than 175 numbers. All of these do not relate to the writings of St. Simon himself, but the four last refer to as many bundles shut up in a box and containing 493 letters. Before the end of the operation, the secretary and librarian of the Duke, being summoned to Paris from La Ferté-Vidame, gave evidence as to the authen-

ticity of all these MSS., and declared (July 28, 1755) that he knew of no others. The letters which related only to private matters were given up to the family; the remainder, enclosed in ten or eleven sacks (sacks for putting oats in), and five large boxes, each shutting with a lock and two padlocks, and having three different keys, were placed in the care of the notary Delaleu (July 2, 1756). They were still in his care when the Bishop of Metz died, without ever obtaining possession of his legacy, and they then passed rightfully to his niece, the Maréchale de Montmorency. They were then, however, taken from the notary by an order of the King, countersigned by Choiseul, and deposited in the archives of the Minister of Foreign Affairs (December 21, 1760).

Was this done by any secret arrangement with the family? We cannot tell. But from this moment the Memoirs began to be known to some privileged persons. The first who saw them was the Abbé de Voisenon, an author of short tales and light comedies. It was for him or, as was said, for the use of Madame de Pompadour, that the portfolios containing St. Simon's Memoirs and his correspondence with the Duke of Orleans were taken from the Archives. It was this frivolous person who was the first to be authorised to draw from this store as he pleased. In fact, he made extracts, especially from the Memoirs, some say in four quarto volumes, others say in eight volumes in small folio. Then came Duclos, another confidant of Madame de Pompadour, and through her favour historiographer to the King. The next was Marmontel, who, like the Abbé de Voisenon, was allowed to take away the original, and who, if he did not gather from it all that he might have done for the *Histoire de la Régence*, at least rendered homage to the vigour of so great a writer.

A little later those who had access to the Memoirs ceased to be content with consulting them. They began to offer them to the public, at first in fragments printed anonymously, then in extracts published with more or less alteration, though nominally as forming a complete work, with the full name and titles of the author. Out of these extracts were formed the editions of Soulavie, 1788, 1789, 1791. But the Memoirs of the great writer were not really known till General the Marquis of St. Simon, having the support of his name, and of his relationship to the author, obtained from Louis XVIII. the restitution of the MS., and published it in its entirety in twenty-one volumes in 8vo. (1829—1830).

We hope at some future time to be able to speak of the work itself. A new edition more carefully collated with the MS. is in progress of publication under the direction of MM. Chenu and Ad. Regnier, fils. For the present we have only to say that M. Baschet has the especial merit of having pointed out that, besides the Memoirs which have been taken from the archives of the Ministry of Foreign Affairs, there must be other MSS. of St. Simon still remaining there. It may be that his book may have a more general result than the recovery of these particular MSS. In his preface he insists energetically on the advantages which would ensue if the documents which

former diplomacy has amassed in these archives were delivered over to the researches of history, and he argues that there is no longer any public interest to be served by forbidding their use. On February 21, in consequence of a report of the Minister of Foreign Affairs, in which the same arguments are used as those which have been urged by M. Baschet, a decree was issued constituting a Commission of the Archives of this Department, with directions that every possible satisfaction should be given to the just claims of history as far as it was possible to do so without betraying State secrets (*Journal Officiel*, Feb. 22, 1874); since which time the Minister, in anticipation of the report of the Commission, has authorised access to the Archives under certain restrictions. If M. Baschet's opinion has had any influence upon this resolution of the Duke Decazes, it is the first service—and that no slight one—which his book has rendered to the public.

H. WALLON.

CURRENT THEOLOGY.

The Gospel its own Witness. By the Rev. Stanley Leathes, Hulsean Lecturer, 1873. (London: Henry S. King & Co., 1874.) Mr. Stanley Leathes may fairly pass as an eminent apologetic writer, though he is hardly one of the champions of conservative criticism, whom destructive critics feel bound to discuss if not to respect. He addresses himself rather to the general public, who are affected not by any special criticism, but by the general impression that there is a great deal of criticism afloat; and his method in this work at any rate is to call attention to the mass of fact which criticism leaves practically unexplained while making lavish hypothetical concessions, e.g., in order that the gospels may not turn out "forgeries," he says they are practically anonymous. The first of the four lectures is taken up with a description of the present state of the Church of England, designed to show that if we could all put ourselves back into the position of new converts to Christianity we should be much better off, but such a remedy for the disorders of a community with a long history is impracticable, and hardly ought to seem desirable. The second is a clever summary of the Gospel of St. Mark. Two points call for comment: the first is an attempt to prove that the Resurrection is probable *à priori*, because our Lord was put to death for claiming to be the Christ. As our Gospels stand, it is clear that from first to last He kept this claim in the background (not choosing, perhaps, to be viewed through the bewildering halo of contemporary Messianic expectation) and that it was at most the pretext for His execution. The second point is an unpleasant hankering after the dilemma *Aut Deus aut non bonus*, which involves, among other paradoxes, the assumption that theism in its full sense is independent of Christianity. The third lecture is taken up with the epistle to the Philippians, which is supposed to prove how the facts of Christian history worked on a population acquainted with Greek culture. The fourth is devoted to general illustrations of an argument which it will never be possible seriously to discredit, that a beneficent belief ought to be held. This is complicated by an attempt to show that if an apologist has proved anything, he has proved everything. It is impossible to give a precise account of the origin of Christianity, and difficult to give a coherent explanation of its effects without resorting to the hypothesis that both are due to the special operation of a superhuman Power, but that this hypothesis should have a steady influence upon conduct, it requires to be supplemented by two further assumptions: 1. That our knowledge of the details of such operation is accurate enough to

be made the foundation of inferences; 2. That the Power so manifested has complete and unimpeded control of the world. For the present, the tendency of science is to make the first assumption increasingly difficult, and the tendency of civilisation to make the second increasingly difficult. The children of this world are in their generation wiser than the children of light.

Forgiveness and Law. By H. Bushnell, D.D. (London: Hodder & Stoughton.) There is a radical defect in Dr. Bushnell's method which prevents his works on the Atonement from being permanent contributions to theology. When he has formed a conception of the facts which suits his spiritual instincts, he compares it, not with the teaching of apostles and prophets, but with the latest phase of American Calvinism, though, to be sure, his philology is so random (for instance, he cannot conceive that *justitia* is Latin for *δικαιοσύνη*), and "righteousness" English for *justitia*) that his exegesis even if candid and disinterested would be worthless. This is a pity, for though he comes nearest to writing English when he is writing Emerson, he has some real eloquence, and as much spiritual insight as we can expect of theologians now.

In the first edition of the *Vicarious Sacrifice*, the author, after developing in the first two parts the thought that by sacrificing Himself (in the ordinary literary sense of sacrifice) for the world, Christ became the power of God unto salvation, proceeded in the last two parts to show that this was done without impairing the value of the legal sanctions of duty, and that these, in fact, were heightened by the authoritative revelation of hell and judgment. Though acute, the discussion was confused and fragmentary, and, above all, less original than in the first half of the work.

These two parts are to be cancelled and replaced by the present work, which is a development of the following thoughts. God experienced a real difficulty in forgiveness, which He overcame by making the costly sacrifice of the Cross for man; Christ through this sacrifice of His life and death consecrated the law (viewed as a type of the discipline of men through the consequences of their own actions), by submitting to it, and made this submission a means whereby men could rise from mechanical grudging obedience to a fixed routine (represented, the author thinks, by Law), to the freedom of obedience to a personal Inspiration (represented, the author thinks, by the Commandment).

The first of these thoughts is surprisingly anthropomorphic, the main importance of the rest is that they suggest acute remarks on the providential administration we are under in this life, which the author thinks is arranged not to give us our deserts, but to give us the best chance for our characters. Dr. Bushnell intends to incorporate the present work in a new issue of *Vicarious Sacrifice*; in view of this he may, perhaps, do well to consider whether the Atonement is really a universal necessity of the Christian conscience, or a personal necessity of a certain type of Christian conscience of which there were few examples between St. Paul and Luther. St. Augustine passed through the crisis of his conversion without feeling what is represented as a universal need.

EDITOR.

NOTES AND NEWS.

MR. GLADSTONE is going to reprint the Homeric papers which he contributed to the *Contemporary Review*, and which are perhaps forgotten in the stir created by his more famous paper on the Ritualists. The title of the volume will be "*Homer and Egypt: A Contribution towards determining the place of Homer in Chronology.*" Reprinted from the *Contemporary Review*, and enlarged." Messrs. Macmillan are to be the publishers.

A WORK entitled *Studies in Design for House*

Decorators, Designers, and Manufacturers, by Christopher Dresser, Ph.D., F.L.S., F.E.B.S., &c., will shortly be published in monthly parts by Messrs. Cassell, Petter & Galpin. The work will consist of a series of original designs by the author, prepared during the last fifteen years, beautifully printed in water-colours, and accompanied by descriptive letter-press.

MESSRS. CHATTO AND WINDUS will publish, in November, a Book of Grotesque Designs and Historical Notes, about the births, deaths, and characteristics of some kings, queens and other things, drawn and written by S.A. the Princess Hesse-Schwarzbourg. The work will be printed in gold and many colours by Dalziel Brothers at their Camden Press.

WE are asked to state that Mr. W. H. Smith, M.P., will preside at the anniversary festival of the News-vendors' Benevolent and Provident Institution, on January 26 next.

A SOCIETY for the protection of literary property and dramatic art has been formed in Russia. The statutes of the society are drawn up on the communistic principle that the productions of every one of the members should benefit the whole society. The latter have to keep up relations with all the managers of theatres, and sell them the right of producing new dramas. The royalty goes into the society's cash-box, and the authors receive the percentage granted by the general meeting of the society.

Leur is the next play of Shakspeare's that Mr. Aldis Wright will edit for the Clarendon Press School Series.

AMONG the books promised for this autumn in the United States, are a volume of essays by Professor W. D. Whitney; and *Parnassus*, a volume made up of extracts from English poetry, edited by Mr. Ralph Waldo Emerson, and with an Introduction by him. Scribner, Armstrong & Co. announce *Notes of a Journey in 1873 in the Russian Province of Turkestan*, by Eugene Schuyler.

M. ALBERT RÉVILLE has, after a year of waiting, obtained leave from the French Government to deliver a *conférence* on Rabelais, at his native town of Dieppe. The Jesuits were vastly scandalised at the idea of a heretic pastor lecturing on the witty but profane Rabelais. The *conférence* was, we believe, delivered on Friday (October 9).

DR. JAMES A. H. MURRAY has "Fitted the First" of his parallel four-text edition of *Tomas off Ersel-doune* in revise for the Early English Text Society. As ill luck will have it, lines 109-16 exist only in the partly-burnt Cotton copy, so that four of these lines are without their heads.

PROFESSOR WAGNER, of Hamburg, has now finished his great collection of the earliest works of Modern Greek Poetry, in which he has printed above 9,000 lines for the first time. Dr. Wagner has also just finished a careful reprint of Bentley's famous *Dissertations*, in the original spelling, with an introduction and notes. Dr. Wagner thinks of reprinting the very rare, if not unique, 1595 edition of "*Alcilia Philoparthenos Loving Follie* . . . at London, printed by R. R. for William Matter, dwelling in Fleet Street at the signe of the bande and plough," 1595. The earliest edition known to Corser, Collier, and Hazlitt, is that of 1603.

MR. FRANCIS GALTON has been for some time collecting statistics to develop in one particular department the line of investigation sketched out in his book on "Hereditary Genius." He has rifled blue-books and the lists of universities and scientific societies for facts about the origin and training of our English men of science. And to verify these facts and add to them more abundant detail, he has sent round a form of enquiry to several hundred scientific men to be filled in, as far as possible, with regard to the following points:—"Race and Birthplace," "Occupation of Parents

and Position in Life," "Physical Peculiarities of Parents," "Size of the Family, and order in it as to date of birth of the scientific man in question." The results of a comparison of these will be published in a forthcoming volume, to be illustrated with copious tables and a map of England, marking those areas that are productive and those that are barren of scientific men. The volume will be published by Messrs. Macmillan under the title of *English Men of Science*.

DR. J. A. H. MURRAY's *Specimens of Northern Literature and Language*, for the Clarendon Press Series, is nearly ready for press. In it Dr. Murray will give extracts from many unprinted manuscripts, including Barbour's *Lives of Saints* (which Mr. Henry Bradshaw discovered), the oldest Northern *Cursus Mundi* from the Edinburgh Physicians' MS., &c.

THE Early English Text Society has now in type, for its Extra Series this year, two very interesting treatises on the social evils of England in the latter years of King Henry VIII.—namely, Henry Brinklow's *Complaynt of Roderick Mors, sountyme a Gray Fygre, vnto the Parkament house of England, his natural Cuntry. For the redresse of certain wicked Lawes, euil Customs, and cruel Decreys: imprinted at Sauoy per Franciscum de Turona (1542?)*—it mentions January 16, 1541-2—and his *Lamentacion of a Christian against the Cite of London, made by Roderigo Mors, Anno Domini, M.D.XLII. Prynted at Jericho in the Land of Promis. By Thome Trowth.* Brinklow professes to be in exile for his religious opinions, and writes vigorously for reforms, some of which have taken centuries to get. After the never-failing Tudor-time complaints of raised rents and enclosures of open land, Brinklow calls for redress of the abuses of selling wards for marriage: the King's purveyors taking produce at a third under value, and paying only by tally; of writs being serveable in only one county; of promoters, or informers, bringing false accusations against a man, and leaving him to pay his own costs; of the judges and pleaders not having a fixed salary, but living on the suitors; of the cruelty and exactions of the Augmentation and Marshalsea Courts; of the delay and abuses of the law; of prisoners being kept without food—a point on which Stubbs is so strong—of half-Popish priests trying reformers; of lords being parsons, vicars, and sheepmasters; of the taking of first-fruits; of abuses in religion, &c. In his tract against the City of London, Brinklow inveighs against the open vices of the aldermen, &c., their injustice and selfishness to the poor, and their continuing Popish practices. These books will be edited by Mr. J. M. Cooper and Mr. Furnivall, and will form a pendant to the latter's "Ballads on the Condition of England in Tudor Times." (Ballad Society.)

MESSRS. WILLIAMS & NORGATE intend to issue a cheap readable translation of *Hermann and Dorothea*, rendered into English hexameter verse by Mr. Marmaduke Teesdale.

THE Rev. Dr. F. G. Lee, of All Saints, Lambeth, has in the press a volume of facts, records, and traditions, which he has collected relating to dreams, omens, miraculous occurrences, apparitions, wraiths, warnings, second sight, witchcraft, necromancy, etc., which will be published by Messrs. Henry S. King & Co. under the title of *Glimpses of the Supernatural*.

MESSRS. HENRY S. KING & Co. will shortly publish a volume entitled *Fragments of Thought*, by T. Bowden Green. It will be dedicated by special permission to the Poet Laureate.

THE same firm has two volumes of poetry in the press. One is entitled *Aurora, a Volume of Verse*, which will be published immediately; and the other is entitled *Strong as Death*, by Adon, the author of *Lays of Modern Oxford*. This book will be illustrated with drawings by H. Paterson, M. E. Edwards, A. T., and the author.

MESSRS. HENRY S. KING & Co. likewise have in preparation a work entitled *John Knox and the Church of England: his Work in her Pulpit, and his Influence upon her History, Articles, and Parties*. It is a monograph from the pen of the Rev. Peter Lorimer, D.D., of the English Presbyterian College, London, founded on several important papers of John Knox, which have never before been published or used for the purposes of his biography. One is a memorial, a confession addressed to the Privy Council of Edward VI., in 1552, on the subject of kneeling in the communion—immediately before the publication of Edward's second Prayer Book—and another a long epistle of Knox to his former congregation in Berwick; another from London, at the close of the same year, upon the same subject, in which he deals with the question of conformity to the rubrics of the New Prayer Book.

MR. C. EDMUND MAURICE will shortly issue the second volume of *The Lives of English Popular Leaders*. The biographies in this volume, which will be published by Messrs. Henry S. King & Co., are of Wat Tyler, Ball, and Oldcastle.

THE same publishers are about to issue in their "Cornhill Library of Fiction" the novel published in library form some three years ago, under the title of *Half-a-dozen Daughters*, in which shape it was very well received by both the public and the reviewers; the edition being exhausted within comparatively a short period, since which time the book has been out of print.

Seven Autumn Leaves from Fairyland is the title of a new book for juveniles which Messrs. Henry S. King & Co. will publish early in the coming season. It will be illustrated with etchings.

PROFESSOR DOWDEN, of Trinity College, Dublin, has recently come on an interesting set of Shakspeare traces in 1639, in *The Heroine, or the Lives of Arria, Paulina, Lucrecia, Dido, Theutilla, Cypriana, Aretaphila* (London: Printed by R. Bishop for John Colby, 1639), dedicated to Lady Dorothy Sydney, by G. Rivers, who is the author of the book, though neither he nor it is mentioned by Watt, Lowndes, Alibone, or Hazlitt. The book is not in the Bodleian, is not known to Mr. Halliwell and Shakspeare critics; and though a copy is in the British Museum, the book must be very rare. For the author's borrowings, compare the following bits from Rivers's life of Lucretia with the lines from Shakspeare set under them:—

R. They . . . unlock the treasures of their hearts, their wives and their beauties, to the admiration of unsound cares.

S. For he the night before, in Tarquin's tent,
Unlocked the treasures of his happy state.

R. *This night I must enjoy thee, Lucrecia.*

S. *Lucrece*, quoth he, *this night I must enjoy thee.*

R. Mounted upon the wings of lust and fury, flies to Rome.

S. From the besieged Ardea, all in post,
Borne by the trustless wings of false desire,
Lust-breath'd Tarquin, &c.

R. *The sin unknown is unacted.*

S. *The fault unknown is as a thought unacted.*

R. In Tarquines shape I entertain'd you: wrong not the Prince so far as to prostrate his fame to so inglorious an action.

S. *In Tarquin's likeness I did entertain thee.*

Hast thou put on his shape to do him shame?
To all the host of heaven I complain me!
Thou wrong'st his honour, wound'st his Princely name.

R. Shee, affrighted at the sword, and blasted by the light that lust gave life to, trembling like a prey, with more horror than attention.

S. [Her eyes] Are by his flaming torch dimm'd
and controll'd. . . .

Like to a new-kill'd bird, she, trembling, lies.

She dares not look: yet winking there appears

Quick shifting antics, ugly in her eyes:

Such shadows are the weak brain's forgeries.

&c. &c. &c.

Can these parallelisms be due to a common

original, or did not rather Rivers use Shakspeare's *Rape of Lucrece* without acknowledgment?

Certain it is that William Painter's *Palace of Pleasure* (1575), which is generally supposed to be the source of Shakspeare's poem, has none of the expressions quoted above, except one word: "Sextus Tarquinius . . . who being well *entertained*, after supper was conveighed to his chamber." (Hazlewood's reprint, vol. i. p. 8.)

THE Hunterian Club of Glasgow are going to reprint the whole works of Samuel Lodge, whose prose tracts are so valuable in connexion with Shakspeare and the drama of his time. These works are:—

- No.
1. An Epitaph of the Lady Anne Lodge. (Not known now to exist).
2. A Reply to Stephen Gosson's School of Abuse, &c. Small 8vo. 1579-80.
3. An Alarum Against Vsurers, &c. 4to. 1584.
4. Scillaes Metamorphosis: Enterlaced with the unfortunate Love of Glaucus, &c. 4to. 1580.
5. Rosalynde Euphues Golden Legacie, &c. 4to. 1590. (On which Shakspeare's "As You Like It" was founded.)
6. The Famous, True and Historicall Life of Robert Second Duke of Normandy, &c. 4to. 1591.
7. Catharos. Diogenes in his Singularitie, &c. 4to. 1591.
8. Euphues Shadow, The Battaille of the Sences, &c. 4to. 1592.
9. The Life and Death of William Longbeard, the most famous and witty English Traitor, borne in the City of London, &c. 4to. 1593.
10. Phillis: Honoured with Pastorall Sonnetts, &c. 4to. 1593.
11. A Spyders Webbe. 4to. 1594. (Not known now to exist).
12. A Looking Glasse for London and England, &c. 4to. 1594. (Played earlier: written in conjunction with Robert Greene the dramatist, who died in Sept. 1592.)
13. The Wounds of Civill War: lively set forth in the true Tragedies of Marius and Scilla, &c. 4to. 1594.
14. A Fig for Momus: containing Pleasant Varietie, included in Satyres, Eclogues, and Epistles, &c. 4to. 1595.
15. The Divel Coniured, &c. 4to. 1596.
16. VVits Miserie, and the VVorlds Madnesse, &c. 4to. 1596.
17. A Margarite of America, &c. 4to. 1596.
18. Prosopoeia, containing the Teares of the holy, blessed, and sanctified Marie, the Mother of God, &c. 8vo. 1596.
19. Paradoxes against Common Opinion, &c. 4to. 1602. (No perfect copy known.)
20. A Treatise of the Plague, &c. 4to. 1603.
21. The Poore Mans Comfort. A MS. in the possession of Mr. Collier.

Lodge was a contributor to two poetical miscellanies, "The Phoenix Nest," 1593, and "England's Helicon," 1600. He also translated the works of Josephus and Seneca; both printed in folio, the first in 1602, and the other in 1614. These translations will not be reprinted by the Club.

The Club has two pieces by Samuel Rowlands, in the press, and has had half the Bannatyne MS. copied for its Part II. of that work.

UNDER the heading "Modern Culture," in the current number of the *Quarterly Review*, a writer of the good old school comes forward in an attitude that promises at first sight to be entertaining. Mr. Carlyle and Mr. Matthew Arnold are the two representatives of modern culture whom it has occurred to the reviewer to pair together. But this juxtaposition is not the pleasantry it looks; and in the sequel the reviewer shows himself exempt from any tinge of humour. There is even something touching in his expression of gratitude to Mr. Matthew Arnold for jokes pointed once and again at the expense of commercial and parliamentary Liberalism—jokes "which to the Tory mind are full of salt and savour," but which the Tory mind has not the knack of making

for itself. No, not in the light armour of railery will a Quarterly Reviewer fight his battles. His weapon shall be the two-handed sword of logic, cut and thrust. With this he will pierce through the weak points in his victims' harness, transfixing alike Mr. Matthew Arnold as he advances before us the standard of *our best self*, and Mr. Pater in the act of descending on the significance of an Italian lady's smile. "Petitio principii!" cries the champion in the rusty suit, as he deals his smashing blow at Mr. Matthew Arnold; "rhetoric and poetical finery!" as he descends upon the author of the *Studies on the Renaissance*. Look at me! we hear him cry; I will teach you what criticism means. "Criticism, in the old and honest acceptation of the word, can only mean the art of judging from evidence;" and "the critic who forms a judgment on a matter of taste and feeling is simply required to lay his premisses before his audience in the clearest possible shape, leaving the jury to consider whether the conclusion is just." And, once more, Look at me; I will tell you what culture should be like;—it should be "social, public, national, breathed from the common air, not elaborated out of the individual mind;" it should be the old-fashioned Culture "which reared the men of Trafalgar and Waterloo," and which "does not consist of constant self-analysis, perpetual depreciation of our fathers, everlasting glorification of ourselves." Alas! the war cries and emblazonments may be old and honest, but the suit is rusty and the tools are blunt. The Quarterly Reviewer is logician enough to remember that premisses and a conclusion are the parts of a syllogism; but he has forgotten that a premiss is a judgment no less than a conclusion is, and that the critic, if without syllogisms he cannot be happy, must see that his major and minor are to the point; in a word, that he must judge before he can reason. And, in criticism, the only means of judging in such a way that your major and minor shall be to the point are by the exercise of tact and a sympathetic sense of what you are criticising. But against tact and the exercise of a sympathetic sense "in matters of taste and feeling," the Quarterly Reviewer enters (at p. 412) an explicit protest; he finds that these qualities result in verdicts which he cannot follow, and which seem to him the vagaries of private interpretation. But to follow the Reviewer so attentively is superfluous and scarcely fair. A writer expecting attention would hardly have thought it relevant to conclude a study of modern tendencies as exhibited in Mr. Carlyle and Mr. Matthew Arnold with the protest above quoted against a culture which consists of perpetual depreciation of our fathers and everlasting glorification of ourselves. The interest of the article consists not in what the writer intends to say, but in what he says without intending it. His objection to the most advanced culture of our time, that it is apt to savour of private interpretation, and to be something individual, not general, not diffused, not the property of the many—that objection taken in another sense is just. It is just, not because the advanced culture of individuals has left behind the narrow round in which "the men of Trafalgar and Waterloo" were trained, and along which to this day a shambling critical Conservatism lumbers happily among scraps from Aristophanes and Bishop Butler, and comfortable reflections on the result of Mr. Gladstone's appeal to the country. The objection is just, not because of the forwardness of the few, but because of the backwardness of the many which leaves the few alone. And the question raised by a performance like that before us is this: How shall the friends of culture in England best exert themselves for making culture the property of the many? How shall they diffuse and propagate such a current as in the fulness of time shall carry even Quarterly Reviewers along with it?

WE have had the first number of a new German periodical sent to us, which, under the title

Deutsche Rundschau, proposes to pass in panoramic review all branches of general knowledge, without dwelling upon special departments, or assuming any distinct religious or political bias. Its object, as it is defined in the preface, is to be the representative organ of the general cultivated German public, and in so far to supply a want not otherwise provided for by the periodical literature of Germany. The *Deutsche Rundschau* is under the direction of Herr Julius Rodenberg, and is published in monthly parts by Messrs Paetel, of Berlin. The October number, in which it begins its existence, contains novelettes by Berthold Auerbach and Theodor Sturm; "Personal Reminiscences of the March to Sedan," by J. Verdy du Vernois; "Contributions to our Knowledge of Kaulbach and his Works, derived from his letters to Councillor Schüller;" a critique on Wagner's *Tristan und Isolde*, with general notices of popular science, and politics, literature, the theatres, etc.; and a few other papers on historical subjects. From this summary it will be seen that in the character and assortment of its materials it does not differ very widely from the general run of monthly periodicals as they appear among us; but it is very possible, as the editor asserts, that a journal of this mixed and unspecific nature is still unknown in Germany. We confess that the present number does not impress us very strongly, and that we should not have augured very favourably of the future success of a new periodical in this country which began its career with so few marks of distinctive excellence, but there can be no doubt that among Germans, who are as yet indifferently supplied with general popular journals, the *Deutsche Rundschau* will find a sufficiently large circle of readers; more especially as in addition to the writers who have contributed to the first number, papers are promised in the future from Paul Heyse, Professors Virchow and Hillebrand, besides many others distinguished in literature and science.

A MONUMENT to Franz Grillparzer, the great German-Austrian poet, was unveiled last week at Baden, near Vienna. The monument has been erected on the spot in the Baden Stadtpark where he used to sit nearly every summer afternoon for the last twenty years or more before his death, and where we witnessed the production of many a delightful little poem, many a caustic epigram.

WITH reference to the discussion in our columns between Mr. Furnivall and Mr. Skeat as to the first use of the auxiliary *do* in English, Dr. Richard P. Wülcker informs us that he finds a clear instance of this use in 1298 (?) in Robert of Gloucester's Chronicle, p. 8, l. 180, ed. Hearne:—"Fosse' me clepup pike wey, pat by mony god toun *dop* wende," and that Koch gives another instance in Anglo-Saxon. Dr. Wülcker expects to find more early instances in Northern texts, as more are printed, for the Northern dialect developed more quickly than the Midland and Southern.

THE REV. DR. ABNOTT has in the press the continuation of his little grammar *How to Parse*. He hopes to explain every difficulty in the structure of English sentences, and show that all irregularities arise from regularities, by ellipsis or false analogy.

WE are very glad to hear that the Early French Text Society, so long hoped for as the mate of the Early English one, is at last in process of formation.

THE July number of the *Journal Asiatique*, which has just reached us, contains the annual report on Oriental Literature by M. Renan. It confines itself to the labours of French scholars, while formerly these reports gave a survey of all important publications in Oriental literature. M. Renan is satisfied with the work done by French scholars during the last year. "Amidst the numerous essays," he writes, "showing either the maturity of perfect knowledge, or a laudable effort

to do well, I see none which does not deserve praise. Scholars seem to me almost always too severe in the judgments which they pronounce of each other. Whoever occupies himself with honesty and perseverance in disinterested research is worthy of our esteem. It shows great presumption to employ contemptuous and ill-natured expressions. Let him who has never made a mistake, throw the first stone." M. Renan then refers to the controversy between G. Hermann and Otfried Müller, but calls the latter Alfred Müller.

PROFESSOR POTT is preparing a new edition, with notes, of Humboldt's essay *On the Variety of the Structure of Language, and its Influence on the Intellectual Development of the Human Race*. This essay formed the introduction to Humboldt's posthumous work on the Kavi Language, and was first published in 1836.

THE Swiss inhabiting the United States are raising a subscription to erect a monument to Agassiz. The sum required is 300,000 dollars (60,000*l.*), of which half has been already subscribed.

Two important contributions to American history have recently appeared, viz., the tenth and last volume of the Hon. George Bancroft's *History of the United States from the Discovery of the American Continent*, and Mr. Francis Parkman's *The Old Régime in Canada*, which forms the fourth part of this writer's *France and England in North America: a Series of Historical Narratives*.

It was in 1834 that Mr. Bancroft published the first volume of his history, and he has written a book which must be for a long time the standard authority on the subject. During these last forty years, however, a great many new sources of information have come to light, such as Governor Bradford's history of Plymouth and the manuscript records of the Plymouth and Massachusetts colonies, which might well be the cause of some changes in the earlier volumes. Then, too, there has been a very lively war of pamphlets between Mr. Bancroft and those of his fellow-countrymen who are fortunate enough to have famous grandfathers. The historian has frequently called in question the merits of these generally honoured men, and he has shown great unwillingness to accept the many corrections of their angry descendants, who, it must be said, have often had the right on their side. Moreover, great objections have been made to the colouring given to the history by the author's political opinions. That the book has real value no one would for a moment think of denying. It is the only complete history of the period it undertakes to describe, and this fulness outweighs the disadvantage of the rather pompous style of the later volumes.

In this concluding volume we have the continuation of the history of the revolutionary war from 1778 to 1782, when peace was made between England and the United States. It is far from being merely a record of the campaigns. Much space is given to a thorough and interesting account of the negotiations which secured France as an ally, and to the discussion of the relations of other continental countries to England at that time. For these subjects Mr. Bancroft was able to consult some hitherto unused material, and the result is a valuable record of an interesting part of the diplomatic history of the last century. The account of the signing of peace is full and important. A chapter is devoted to a brief sketch of the slavery question, as it then presented itself to our forefathers, showing how even a century ago, the "institution" was a cause of dissension. With all its merits, the main defect of the history is the author's somewhat ponderous style. In spite of all the outbursts of fine writing, there is not a single impressive picture in the book. It is a history which gives a great deal of information, rather than one that tells a story. And therefore

it is more likely to be found on the shelves of libraries than in the hands of readers.

Mr. Parkman's History is of a different kind; it has the merit of being entertaining as well as useful. His aim in this volume was to give the reader a clear notion of the condition of Canada with regard to religion and politics from the year 1653 to 1763. The contrast between the English and the French political methods is nowhere more conspicuous than in the history of their colonies. The fitfully watchful paternal Government of France, the rigid rule of the priests, the dependence of the colonists on the mother-country, made the early history of Canada singularly unlike that of the Southern side of the boundary line. Mr. Parkman sets before the reader, with great clearness and with admirable picturesqueness, the struggles of the Jesuits for supremacy in the colony, and for influence among the neighbouring Indians. He does justice to the earnestness of those enthusiastic workers, and if he smiles incredulously at the frequent miracles recorded in the early annals, it is no more than the Jesuits themselves at Quebec did at the reports of the prodigies which were spread abroad by the Sulpician priests at Montreal. The disadvantages of the close dependence of the colony on the mother-country are clearly set forth. A petition to the King for money was the beginning of every new enterprise, and, what was still more demoralising, these petitions were seldom refused. The Government had its hand in everything; a beggarly nobility was set down in the wilderness; there was nothing it could enter the heart of man to do but some law was to be found limiting, defining, or forbidding it; no history is fuller of warning against a paternal government than this of Canada. The strength of the country lay almost entirely with those who broke away from the cramping rules of the colony. In his last chapter Mr. Parkman describes the difference between the French and English colonies in America:—

"The institutions of New England were utterly inapplicable to the population of New France, and the attempt to apply them would have wrought nothing but mischief. There are no political panaceas, except in the imagination of political quacks. To each degree and each variety of public development there are corresponding institutions, but answering the public needs; and what is meat to one is poison to another. . . . Church and State were right in exercising authority over a people which had not learned the first rudiments of self-government. Their fault was not that they exercised authority, but that they exercised too much of it, and, instead of weaning the child to go alone, kept him in perpetual leading-strings, making him, if possible, more and more dependent, and less and less fit for freedom.

"In the building up of colonies, England succeeded and France failed. The cause lies chiefly in the vast advantage drawn by England from the historical training of her people in habits of reflection, forecast, industry, and self-reliance: a training which enabled them to adopt and maintain an invigorating system of self-rule, totally inapplicable to their rivals."

THE present number of the *Quarterly Review* contains under the heading "The Republic of Venice"—apparently by a well-known hand who reveals his individuality in a note to p. 457—an interesting account of the fortunes and institutions of that strange anomaly in the mediæval world, the Venetian Oligarchy—such an account, in fact, as a clever writer knows how to glean from various sources. Unlike the Roman patricians, the Venetians never learned the secret of merging their isolated power in ever-widening circles of fresh participants, and of founding an empire by the sacrifice of their own dominion. Hence the necessity of terrorism. One criminal, as the reviewer tells us, was to be conducted to the Canal Orfano, where, his hands being tied and the body weighted, he was to be thrown in by an officer of justice. Another was to be poisoned secretly, another strangled with equal secrecy. Doubtless it is true that for the mass of its subjects the Venetian government was a mild one. But the

moral effect of the system upon those who were capable of independence of thought must have been terribly depressing, and we may well agree with the reviewer in holding that "the durability of an institution is only a merit or a good when it contributes to human happiness or intellectual progress."

THE history of Scotland for many a long day was to a great extent the history of its nobility, and in the *Edinburgh Review* will be found in a notice on Mr. Fraser's *Book of Carlevarock*, a sketch of the fortunes of the Maxwells from the original Maccus, from whom they are said to have sprung, down to the last Earl of Nithsdale, who was condemned to death for joining the Old Pretender, and who was rescued by "the loving devotion and successful bravery" of his wife. Mr. Fraser's version, we are told, of the letter in which the Countess tells "so simply and yet so touchingly" the story of the rescue, "differs in many places from the hitherto published copies," being "taken from the original letter now in the possession of Lord Herries."

WE understand that the translation of Ranke's *History of England*, which will shortly appear, has been undertaken (with the express sanction of the author) for the Clarendon Press by eight members of the University of Oxford, who have been engaged on it for about two years. Each of the eight has translated one volume and revised another. Besides this the whole eight volumes have been revised by the Rev. C. W. Boase, of Exeter College, and the Rev. G. W. Kitchin, of Christ Church. The other six translators are the Rev. A. Watson, of Brasenose; Rev. H. B. George, of New College; Rev. W. W. Jackson, of Exeter; Rev. A. Plummer, of Trinity; Rev. M. Creighton, of Merton; and Mr. H. F. Pelham, of Exeter. References have been to a great extent verified; but this has not always been possible, as the edition used is commonly not stated by the author. No notes have been added. The intention has been so far as is possible to present the work to English readers precisely as it stands in the original. The translators have merely here and there ventured to correct obvious mistakes, which may either be misprints in the original, or slips of the author owing to a want of minute knowledge of English affairs.

The name of Ranke is sufficient guarantee for fairness and learning. Moreover, the author has had access to documents which no previous historian has used. It is expected that these volumes (six in the English edition) will in more ways than one prove superior to anything at present in English touching the same period. Those who know the way in which the reigns of Charles I. and of Anne are treated by Ranke, will perhaps be willing to grant, that no Englishman, whatever his learning and abilities, could write at once so impartially and thoroughly on questions about which Englishmen, whether acquainted with the facts or not, feel so strongly.

AMONG the most valuable essays in the current number of the *Revue des Questions Historiques*, we may mention one by M. Charles Jourdain on "La Royauté Française et le Droit Populaire, d'après les écrivains du moyen âge;" and another by R. P. Ch. de Smet, S.J., on "Les Sources de l'Histoire de la Croisade contre les Albigeois." A capital feature of this erudite review is the "Courrier Anglais," by M. Gustave Masson, which is a careful summary of the contents of the most important historical publications recently issued in England.

NOTES OF TRAVEL.

THE Geographical Society of St. Petersburg has received letters from the Inland Section of the Aral-Caspian Exploring Expedition. The date of the latest communications was August 24, at which time the travellers were at Petro-Alexandrowsk, on the Amu-Daria, and had made very

rich collections of various kinds. The naturalists of the expedition considered themselves especially fortunate in having secured 500 admirable specimens of animals belonging to fourteen mammalian families, eighteen species of reptiles, and numerous birds. M. Barbot was engaged in studying the geological character of the Sheikh-Jheli mountains, and proposed, after the completion of his investigations, to return by way of Samarcand and Tashkent, while MM. Bogdanof and Bultterof intended to devote a few weeks longer to the fauna of the Amu-Daria delta, where migratory birds had begun to appear as early as the month of July. After stopping for a time at Kazalinsk, the expedition was to continue its journey to St. Petersburg, which they hoped to reach by the end of October.

THE Russian naturalist and physicist Miklucho-Maklay, has made preparations for undertaking another expedition to New Guinea. He intends taking up his headquarters on the little island Alduma, near the mainland, where the climate is less injurious than on New Guinea itself, and proposes, as on his first voyage in 1871, to devote himself to the study of the ethnological and linguistic peculiarities of the various tribes, while he will also carry on a systematic series of geological and meteorological observations. He had engaged two servants at Amboina to accompany him, who had been to New Guinea with Rosenberg, Serugi, and other travellers; and he has also carried with him the Papuan boy Achmat, who was with him on his former voyage. He is desirous of remaining among the people of New Guinea for several months, at the end of which time the Governor-General of the Dutch East-Indian settlement has engaged to despatch a steam-packet to take him from Alduma, and convey him back to Europe.

DR. SEPP continues his interesting reports of his travels in Asia Minor in the *Allgemeine Zeitung*, a recent number of which informs us that on May 8 he began his excavation of the ruins of the cathedral at Sur. A party of sixty-seven Arabs had been engaged for the work, and by their exertions the chancel was soon laid bare, with its flights of stairs broken away simply for the sake of the stones of which they had consisted. The object of the excavations, which was to discover the grave of the Emperor Frederick Barbarossa, and to bring back his remains to Germany, was certainly not achieved by the indefatigable explorer, but he succeeded in reaping a rich harvest of discovery in regard to the true position and plan of the ancient cathedral, and of the church of St. Mark at Tyre, with its colossal lion, built by the Venetians early in the thirteenth century, while he has laid bare the burying places of various German knights and prelates, who found their last rest on this little oasis of Terra Sancta. It is indeed asserted by the Monk Konrad, in his *Chronicon Montis Sereni* (the Monastery of Lautenberg, near Halle), that the remains of Barbarossa were brought to Spiers and there re-interred—"ossa Spiram reportata et tumulata sunt," says the old chronicler; but this statement Dr. Sepp doubts, and he is so firmly impressed by the conviction that the bones of the great Emperor were deposited and left at Tyre, that he is anxious to induce the Imperial Government to purchase as national property the Cathedral of Sur with a view of causing a more systematic search for the lost grave to be made. He further suggests that the two columns of Egyptian rose granite which he has succeeded in excavating from the Sur cathedral shall be conveyed at the public expense to Germany and be erected before the Palace at Berlin in pious memorial of the great Hohenstaufen emperor.

A SOMEWHAT violent earthquake was felt on the evening of October 7 at Marradi, near Florence, and repeated on the following night with less distinctness. The altars in the church of Valvera were thrown down, and considerable damage done in the neighbourhood.

THE following arrangements have been made for observing the approaching transit of Venus in Asia. At Erivan, in the Caucasus, M. Wagner, deputy-director of Pulkhova Observatory, will observe with a six-inch reflector, furnished with a position micrometer. At Nakhitchevan M. Totchalof will be stationed with a powerful telescope; and Colonel Stebnitsky at Tehran, with a 3.8" telescope. The German observers will make use of heliographs, and the same instruments will be used by the Russian astronomers stationed at Kiachta and in Possiet Bay, on the borders of Manchuria and Corea. In India, special preparations have been made by Colonel Tennant, with the sanction of the Secretary of State, for observing at Rurki, in the North-West Provinces; and an elaborate transit instrument, constructed for him by Messrs. Cooke and Son, of York, has been recently shipped. At Madras Mr. Pogson will observe with a heliograph, which is being now made in Paris; and Mr. Chambers, at Colaba Observatory, will endeavour to make the most of instruments which were supplied on the occasion of the last solar eclipse.

THE *North China Daily News* states that "a party of astronomers, consisting of M. Fleuriat, hydrographer to the French navy, M. Blariez, and M. Lapiéd, has arrived [at Shanghai] to take observations of the transit of Venus in China."

THE *Monde Russe* publishes the following particulars relative to the caravan of M. Morezow, returning from Kashgar, and which arrived at Maryn on August 4:—The caravan left Maryn in the month of April last, and arrived on May 15 at the city of Kashgar. It was not without a certain degree of dread that they approached the territory of the Khanat, and their fears were redoubled when at 200 versts from the city they saw a body of armed horsemen approach the caravan, but the gracious reception they gave them soon dispelled their apprehensions, and the Russian director of the caravan was presented to the Emir Badavlet-Yakoub-Bek. The caravan sold a part of its goods to the inhabitants immediately after its arrival, but the greater part of its merchandise was not fitted for the wants of Kashgar. Consequently, M. Romanow, who commanded the caravan after the death of Hali-faizouline, asked permission of the Emir to continue his journey in the direction of the Chinese towns of Ouroumsi, Manas, Ouliasoutai, Barkoul, Khami, and Tourfane. This the Emir refused, not wishing to give the Russians an opportunity of making themselves acquainted with the route. M. Romanow insisted, but Yakoub-Bek, in order to take away any pretext for going further, bought on his own account the whole of the goods not sold. The caravan returns to Russia with the commodities of Kashgar, among which are indigo, silk, silk stuffs, madder, &c. It remained at Kashgar from May 15 till July 30, and at its departure the Emir made presents to the Russian agents, and ordered an escort to see them safely to the frontier.

THE Governor of the Falkland Islands, Colonel D'Arcy, in his last report, expresses his regret that these islands have never profited by the visit and report of a competent geologist. Mr. Darwin, he writes, only paid a hurried visit in 1834, riding from east to west of the East Falkland, but no report has ever been made on the strata of the West Falkland. There is an impression in this colony that a vein of coal runs through the East Island, whilst silver ore has been found more than once in the West Island.

AN EARLY MAP OF GREAT BRITAIN.

A CURIOUS old map of England and Scotland, bequeathed by the well-known antiquary, Richard Gough, in 1790, to the Bodleian Library, and of which a facsimile has recently been taken for publication with others of the National Manuscripts of Scotland, deserves a much more extended

notice than has yet been accorded to it. It is far superior, both as a work of art and a specimen of early map-making, to any of the maps attributed to Matthew Paris, and is nearly equal to them in point of age. When exhibited at the Society of Antiquaries, in 1768, it was supposed to be of the time of Edward III.; but a more careful consideration of the internal evidence would assign it to the period of Edward I. A description of it, derived partly from the official report of Mr. W. B. Sanders, Assistant Keeper of Records, under whose supervision the facsimile was executed at Southampton, and partly from a study of the facsimile itself, will be read with some interest by topographical enquirers. The principal places are distinguished by churches with spires, or castellated buildings, those of less importance by simple houses, and in each case the buildings are coloured red. The surrounding seas are coloured green, and so are the rivers. The names of counties and tracts of country are enclosed in parallelograms with looped corners, and these as well as all the principal names are written in red, with the exception of London and York, which appear in characters of gold. The principal roads are coloured red, and the distances from town to town are marked by figures also in red, forming, as Gough remarked, the greatest merit of this map, as being the first wherein the roads and distances are laid down. The distances cannot, however, be described as very accurately calculated. The county of Sutherland is distinguished by the figure of a wolf, with the legend, "Hic habundant lupi;" and a place called Colgarth, which is probably the extensive forest between Badenoch and Athole, by that of a stag, with the legend, "Hic maxima venatio." The only one of the Scottish lakes distinctly named is Loch Tay, on the borders of which is inscribed "In isto lacu tria mirabilia, Insula natans, Pisces sine intestinis, Fretum sine vento," miracles generally ascribed by Scotch writers to Loch Lomond. The earldoms of Ross, Caithness, Moray, Sutherland, Mar, Buchan, Athole, Fife, Strathern, Lennox, Menteith, and Carrick are prominently displayed; the fact of there being no mention of those of Douglas and Crawford would seem to fix the date of the map at a period prior to their creation. Off the north-east of Orkney is a vessel lying high and dry on a reef of rocks or sand-bank, with its mast and gear hanging over the side. What appear to be two cushions have been cast overboard, clinging to one of which is a female figure, while a man is depicted rowing to her assistance in a boat. It is ingeniously conjectured that this drawing has reference to the fatal end of the voyage undertaken by the young "Maiden of Norway," Queen Margaret of Scotland, to England, to be married to the Prince of Wales. A great mystery has always shrouded the circumstances of this lady's death; Rapin and the few historians who mention it say that it occurred in Orkney about September, 1290, and that it was occasioned by the hardships of the voyage. It is worth while to notice that at the northern end of the island of South Ronaldsay is a deep bay or inlet, at the head of which stands the village of St. Margaret's Hope, so called, according to Macpherson's *Geographical Illustrations of Scottish History*, from the unfortunate young queen.

On the North Sea is inscribed, "Mare aquilonare sine termino," and in the middle of it is a gigantic representation of the whale engaged in a deadly struggle with its natural enemies, the thrasher and sword-fish. The forests of Inglewood and Dean, and the New Forest, the last of which is marked by a drawing of a large oak tree, are the only forests specially noted in England; but Sherwood Forest is probably meant by the tree drawn in the map north-east of Nottingham. On the sea off the south coast of Devonshire, opposite Dartmouth, is written "Hic Brutus applicuit cum Trojanis," an allusion to the legendary invasion of Albion mentioned by King Edward in

his letter to Pope Boniface recapitulating his claims to the kingdom of Scotland.

Bardsey Island is distinguished by the inscription "Bardsey ubi sunt Britonum vaticinatores," which again furnishes a clue to the date of the map. This island is supposed to owe its name to having been the refuge of the last of the Welsh bards, and as the order of bards may be said to have been extinguished by the subjugation of Wales by Edward I. in 1284, the map is probably not many years later than that date.

Of the two Roman walls, that known as "Adrian's Wall," called in the map "Murus Pictorum," extending from Bowness to Wallsend, is alone represented. The more northern, or "Agricola's Wall," called in Scotland "Graham's Dyke," extending from old Kilpatrick, near Dunbarton, to Carridan, near Borrowstowness, in Linlithgowshire, is unnoticed. Many roads and even distances are given in the southern portion of the map: thus, from London to the Land's End—from London through the Vale of White Horse (named)—from London through Oxford, Gloucester and into Wales (South Wales is named Venedocia)—from London to Dover, to Norwich, to York, Carlisle, and Inglewood Forest; but no road or track passes beyond the Murus Pictorum.

J. J. CARTWRIGHT.

ROYAL HISTORICAL AND ARCHAEOLOGICAL ASSOCIATION OF IRELAND.

THE October meeting of this Society (the last year's proceedings of which we recently noticed) was held at the apartments of the Association in Butler House, Kilkenny. Lieut.-Colonel Macdonnell, Alfred Webb, Esq., and Thos. Lalor, Esq., were elected fellows of the Society, and several gentlemen were also admitted as members. Many objects of interest were exhibited, of which the following were the most noteworthy. Some human remains were presented by Mr. White from a cairn at Shalee, near Ennis, where there are the remains of half an old castle, while on another hill eleven miles away is another ruin, which seems as if it were the missing half of the former. The story in the neighbourhood is that the building at Shalee was formerly inhabited by a wizard and his wife, but in consequence of matrimonial disagreement the husband suddenly removed in the night with his half of the castle, leaving his wife to live in peace in her share of their home. The Rev. J. Graves, secretary of the Association, exhibited a small ivory facsimile of a "Sheela-na-gig," that is, a Priapic figure which occasionally occurs carved on the walls of castles and even churches, probably with the intention of averting the danger incurred from the evil eye and other enchantments. He did not suggest any use to which this small figure could have been put; but it may have been worn as a talisman like the coral charms of a similar character used in Sicily and Italy. Another very singular object was also shown by Mr. Graves, a bull's head of the size of life, with representations of the sun and moon in the centre of the face. It was said to have been dug up at the foot of the Galtee mountain; but the exhibitor did not seem satisfied that it was Irish, thinking that the workmanship was rather Oriental in appearance. Geo. J. Hewson, Esq., chairman of the meeting, exhibited a medal struck by the corporation of Limerick to commemorate the gallant resistance of their Militia to the rebel and French army at Colloony in 1798; and a letter was read, giving an account of the engagement, by Colonel Vereker, the officer in command. A copy of the Dublin *Universal Advertiser* for March 14, 1761, was presented to the Society, containing an account of the opening of Kilkenny Canal, and of its navigation by lighters laden with merchandise. From the discussion which followed, however, it was shown that the canal was never fairly completed, but that these boats were brought over the whole canal, being dragged through the shallows by many

horses, in order to obtain from Parliament the grant of money due on the completion of the work. This paragraph was evidently inserted in the *Universal Advertiser* in order to aid the subterfuge. The seal of the Guild of Barber Surgeons of Limerick, some signet rings and other articles were also exhibited, and the Society adjourned until next January.

NEW YORK LETTER.

New York : October 7, 1874.

There was very little done by our publishers during the summer months, and the few books that were published were mostly works of fiction. One of the most interesting announcements for the fall is that of a new narrative poem by Dr. J. G. Holland, author of *Bitter Sweet* and *Kathrina*. This new poem, *The Mistress of the Manse*, unlike most stories, begins with the marriage of the hero and heroine. It is, however, a love story. The scene is laid on the banks of the Hudson. It is a story of American life during the late civil war, and graphically depicts the agonies of that stormy period. Dr. Holland gives his views on the Woman question in a couple of pages of this book. He has no sympathy with the agitators of this much agitated subject. Philip, the hero, is a Northern man and a clergyman, and Mildred, his wife, is a Southern woman and descended from a long line of slaveholders. At the breaking out of the war Philip lays aside his priestly robes and buckles on the sword to fight in the Northern ranks; Mildred, whose father and brothers are in the Southern army, suffers unknown tortures. After her husband leaves home for the field of battle, she is accused by his fellow-townsmen of having Southern sympathies, and she is spied upon and insulted. Her rebel brother takes refuge in her house, and an excited mob are about to drag him from his sick bed, when the sound of shuffling feet is heard in the distance, and Philip is brought home mortally wounded. He hears that his wife's brother is in the house, and immediately asks to see him. When the two men meet they fall into each other's arms, and

"With breast to breast, and head to head,
Twin barks they drifted from the shore."

The lines engraved upon the monument erected above the two soldiers expresses what is becoming the general feeling between the North and the South:—

"They did the duty that they saw;
Both wrought at God's supreme designs,
And, under Love's eternal law,
Each life with equal beauty shines."

The fact that on Decoration Day the graves of the soldiers who fought and died for the North and the South are strewn with flowers by the same hands, proves that the bitterness of feeling between the two sections of our country has passed away.

Dr. Holland's poem is full of life's philosophy and is rich in natural descriptions, nor is it without its tragedy and pathos. The same author will write the next serial for *Scribner's Monthly*, of which he is editor. This new novel, the name of which is "The Wheel of Fortune," will be a story of American life, and the first chapters will appear in the January number of that magazine.

Henry Holt & Co., of this city, have now in press a translation of Wagner's *Autobiography and Essays*. This is, I understand, the only English edition of this composer's writings, already so popular in their German form.

Thanks to the perseverance of Theodore Thomas and his fine orchestra, Wagner's music is now the most popular that is played in New York—at any rate, it draws the largest audiences. Concerts where the programme has been composed entirely of Wagner's music have been the best attended, and *Lohengrin* was the only opera given by the Italian Opera Company last year that attracted paying audiences.

One of the interesting books of the season is *German Universities*, by James Morgan Hart. Mr. Hart's book is a simple narrative of University life in Germany. His career at Göttingen was quiet and uneventful, remarkable for nothing but hard study and a close observation of the manner of living in a German University town. He compares the German, English, and American Universities, rather to the disadvantage of the two latter. Mr. Hart makes three objections to the English system of education at Oxford and Cambridge—that it is illiberal, expensive, and comparatively unproductive of results. The English University is sectarian in its character and aristocratic in its atmosphere. German Universities are neither. He explains this difference by the fact that the English belong to private corporations, while the German are national. The first part of the book relates to Germany in 1861, but the author revisited that country in 1872-3, and gives an account of the University system in its most recent aspects under the head of "General Remarks."

A Boston firm is about to publish a volume of the collected poems of Mr. T. B. Aldrich, of that city. Mr. Aldrich has long been a contributor of both prose and poetry to the pages of the *Atlantic Monthly*, and his writings are very popular among the readers of that journal. His prose is generally flavoured with a delicious humour, while his poetry is for the most part of the delicately sentimental order. He is not a great poet, but his verses are very nearly perfect of their kind. His love-songs are dainty enough to have been sung by the lovers of troubadour days.

Bret Harte has been hard at work all summer upon a novel and upon a play. The play, I believe, is the nearest completion, and when finished will be produced at the Fifth Avenue Theatre. Mr. Dion Boucicault has not assisted Mr. Harte in the preparation of this play, although there have been a number of newspaper paragraphs to that effect. Mr. Harte's novel will be, like his short stories, descriptive of Western life.

The friends of Mr. Julian Hawthorne, and they are many, do not hesitate to express their disappointment at his last novel, *Idolatry*. The story is fantastic, but not the fantasy of a refined imagination. It is a disappointment not only as a work of art but in its moral tone, which is morbid and unhealthy. There is, however, a certain fascination about the book which only serves to make it the more objectionable.

It is a pleasure to turn from the oppressive atmosphere of *Idolatry* to the pure and healthy pages of Dr. Robert Lowell's *Anthony Brade*. Dr. Lowell is a brother of James Russell Lowell, and is the Professor of Ancient Languages at Union College. He is best known as the author of *The New Priest in Conception Bay*. That story, with its strong painting of the homely inhabitants of Newfoundland, is a tragedy so cleverly drawn, so shrewd and so dramatic, that it would dignify any stage. *Anthony Brade* lacks the tragic force of *The New Priest*. The plot is not so strong, but the character drawing, fun, pathos, and graceful writing in the book are sufficient to command the interested attention of a wide circle of readers.

Miss Kate Field, who is known in England as well as in this country as a successful lecturer, is about to become an actress. Miss Field comes honestly by her dramatic talent, for both of her parents were actors. She has been studying for the stage for some time past, and will make her *début* at Booth's Theatre in this city as Peg Woffington in the drama of that name. Miss Field will continue to write after she begins her new career. She is engaged to write a series of articles on "Republicanism in England" for the *St. Louis Republican* newspaper, and is dramatising Hawthorne's *Scarlet Letter*. Her *Ten Days in Spain*, which appeared in the form of letters to the *New York Tribune*, will soon be published in book form.

The Italian Opera season opened at the Academy of Music in this city on September 28, with Mdle. Heilbron in *La Traviata*. Mdle. Heilbron made a pleasant impression without creating a furor, and her chances of popularity are excellent. Mdle. Emma Albani, Mr. Strakosch's "star" *prima donna*, will not be heard in New York until later in the season. The new operas to be brought out this year are Marchetti's *Ruy Blas*, Wagner's *Flying Dutchman*, and Gounod's *Romeo and Juliet*; Verdi's *Requiem Mass* will also be produced for the first time in this country. Among the important revivals are Meyerbeer's *L'Etoile du Nord*, Bellini's *Norma*, Wagner's *Lohengrin*, and Verdi's *Aida*. Signor Carpi, the new tenor of this troupe, has an agreeable voice of good quality and sufficient flexibility to make him satisfactory in sentimental as well as robust parts. He has not the fine stage presence of Campanini, which did so much towards making that singer's success in *Lohengrin*.

Miss Clara Louise Kellogg, our native *prima donna*, has an excellent English opera company of her own, and is at present making a tour of the Western States. She has herself prepared Thomas's *Mignon* and Balfe's *Talisman* for the English opera stage.

It is predicted that this will be a very bad year for amusements, as we shall probably be poorer than we were last year.

Mdme. Ristori writes to her friends in this country that she is learning the play of *Macbeth* in English. She gave the sleep-walking scene in that play in London some time ago, but she will give the entire play in that language, for the first time, in New York during the coming winter.

CORRESPONDENCE.

THE PARENTAGE OF NAPOLEON III.

Paris: October 19, 1874.

Will you allow me to reply as briefly as possible to Mr. B. Jerrold's letter on the subject of the birth of Napoleon III.? In the first place, I may be allowed to remark that Mr. Jerrold contests the value of a document to which I have appealed, on the ground that the Decazes "have no right to be regarded as impartial witnesses," while he bases his own narrative and assertions on documents taken from the papers of Queen Hortense. It will be admitted that the impartiality of the latter is more open to question than that of the family of the Decazes.

The evidence alleged by Mr. Jerrold does not appear to me to be convincing. King Louis, without doubt, did not publicly disavow the child at the moment of its birth. It is easy to understand that he would not wish to do so. It would have been willing to do it, Napoleon I. would never have allowed him to take such a step. Mr. Jerrold adds that Louis Napoleon inherited the fortune of the King of Holland. This proves nothing; it could not have been otherwise in virtue of the celebrated maxim, *La pater est quem nuptiæ demonstrant*.

On the other hand, it seems to me to be incontestable that, at a later time, King Louis refused to recognise the third son of Queen Hortense as his own. I will only add one piece of evidence in addition to those which I have already furnished. There has appeared this year a volume entitled *Le Dernier des Napoléon* (Lacroix). This volume is written from an Austrian, legitimist, and clerical point of view, and dedicated to the manes of the Emperor Maximilian, and the author in this dedication speaks of the efforts which he formerly made at Miramar to divert that prince from launching into the Mexican adventure. Although the book is anonymous, there is no doubt that it is the work of a very celebrated Austrian diplomatist, who has long represented his Government with the Holy See. At p. 35 I read the following words *à propos* of the insurrection of Forlì:—

"L'ex-roi de Hollande n'avait jamais voulu voir ou reconnaître son fils Louis-Napoléon. Dans son salon de Florence il avait tous les portraits de sa famille, et il faisait remarquer avec une certaine affectation, qu'il n'y avait jamais admis l'enfant de prédilection de la Reine Hortense. Il écrivit au Pape une lettre encore inédite aujourd'hui. C'est un des autographes les plus étranges de cette étrange famille.

"St. Père, écrivait le Roi Louis, 'mon âme est accablée de tristesse et j'ai frémi d'indignation quand j'ai appris la tentative criminelle de mon fils * contre l'autorité de votre sainteté. . . Le malheureux enfant est mort. Que Dieu lui fasse miséricorde!'

"Quant à l'autre † qui usurpe mon nom, vous le savez, St. Père, celui-là, grâce à Dieu, n'est rien. J'ai le malheur d'avoir pour femme. . ."

Did King Louis deceive himself when he wrote

* His second son, who died in the insurrection. The first died young in Holland.
† Napoleon III.

thus? It is difficult to believe it. At all events it will be allowed that such documents justify the doubts of many Frenchmen.

ETIENNE COQUEREL.

"SPURIOUS HEBREW COINS."

Nash Mills, Hemel Hempstead: Oct. 17, 1874.

I have delayed making any further comments on the authenticity of the Shekels collected in Palestine by the late Mr. Tyrwhitt Drake, until I was in a position to speak with confidence both as to their specific gravity and their chemical composition. This, thanks to the kindness of Dr. Walter Flight of the Mineral Department of the British Museum, who has weighed five of the coins and analysed one, I am now enabled to do. The question, as Mr. Francis R. Conder says in his letter which appeared in your columns in September 19, is one of fact; but his statement that any coin of a specific gravity in excess of pure silver must be of other than legal issue cannot be accepted without a proviso that the standard referred to is that of coined silver and not cast, and that the coins are free from any unintentional admixture of gold or even lead.

The author of the anonymous article in the ACADEMY of September 5 states that the specific gravity of a tested specimen of the shekel was 10.8. It does not appear under what circumstances or by whom this result was obtained; but I remarked in my former letter that the value of this piece of evidence depended on the accuracy of the observer, and that the determination of 10.8 had yet to be verified.

That my hesitation in accepting the determination was justifiable will be seen from Dr. Flight's report, which I will now proceed to give in his own words:—

"The results of my examination of the shekels are as follow:—The first one, bearing the date 'Year 2,' weighs 14.2696 grammes (220.209 grains), and has the specific gravity 10.527. Graham says that the specific gravity of pure cast silver varies between 10.474 and 10.512; the mean of these numbers is 10.508. The specific gravity of pure stamped silver is stated by G. Rose to be 10.566. The specific gravity of Mr. Drake's shekel is, it will be seen, about midway between these numbers.

"A quantitative analysis of this same coin showed it to be composed of—

Silver	97.674
Gold	0.676
Copper	0.642
Carbon	0.034
Sulphur, lead, iron, zinc }	Traces
	99.026

"It consists, therefore, essentially of silver, and the other metals are present in such small amount that they can hardly affect the specific gravity of the coin itself. In fact, in a way they compensate each other: though the gold be heavier the copper is lighter, and its alloy with silver has a specific gravity inferior to the mean of the components.

"The other four shekels of Mr. Drake's, which I afterwards received, were more corroded on the surface than the first, and have chloride of silver adhering in some places. This compound, which in its densest form has the specific gravity of 5.31-5.43, tends of course to lessen the specific gravity of the coins. Below are the numbers I obtained:—

	Weight in grammes	Sp. gravity
Year 1	14.0906	10.495
Year 2	13.0458	10.146
Year 3	14.1825	10.472
Year 4	14.3036	10.500

"Whether these contain alloy or not I am unable to say, but I notice green spots on one of them. The specific gravity of standard silver containing 7.5 cent. of copper is 10.200."

A more conclusive vindication of the coins from the aspersions cast upon them cannot be desired. Even the assertion that the incrustation upon them "is not the horn-silver dear to collectors, but resembles a lead slag," is shown to be

unfounded, as Dr. Flight declares it to be chloride of silver.

Into the numismatic questions raised by Mr. F. R. Conder it is needless to enter. I am, however, rather curious to know what was the silver coin of sixty-three grains weight, on which he found the words "Shekel Israel," and where it is preserved.

In conclusion, I may mention that a number of Mr. Drake's shekels were submitted to the Numismatic Society at their meeting on Thursday last, and were accepted as above all suspicion. I may also express a hope that the author of the article attacking the coins may in future be more careful to ascertain the real facts of his case before assuming the part of an assailant. JOHN EVANS.

SCIENCE.

Catalogue of the Anthropological Collection lent by Colonel Lane Fox for Exhibition in the Bethnal Green Branch of the South Kensington Museum. By Colonel Lane Fox. (London: Printed by Eyre & Spottiswoode, 1874.)

COLONEL LANE FOX'S application of the development-theory to explain the history of weapons and implements is one of the best contributions made by Englishmen to the science of culture. It is too little known, for the three lectures on "Primitive Warfare" in which it is most fully worked out are only to be found in the Journals of the United Service Institution. The present publication is a *catalogue raisonné* of the museum of weapons, &c., the classification of which has led Colonel Fox to form his theories, which are stated in the introductory remarks to each set of specimens. The doctrine of evolution so enlivens everything it touches, that it can make even a catalogue readable.

The first class of weapons illustrated are shields. It is often thought that the shield was primarily a screen or shelter for the warrior to ensconce himself behind, but the savage specimens go far to justify Colonel Fox's different view. He maintains that the original type was a mere parrying-stick grasped in the hand, such as those with which South Sea Islanders and other tribes used to ward off darts with wonderful skill. In Australia and Africa the parrying instrument becomes a kind of triangular bar wide enough in the middle for a hand-grasp behind. Thence, a series of stages connect the parrying-stick with the larger shield or target, but the original nature of this is shown in almost all cases by its having to be played or brandished to keep off missiles. It is only for special purposes, such as Assyrian siege warfare, that we find the warrior with a shield large enough to hide his whole body. Among the last shields used in Europe were the targets carried by the 42nd Highlanders in Flanders in 1747. Next, the various stages of body-armour enable Colonel Fox to show how the imitation of nature becomes the origin of art. Savages begin by putting on thicker skins, like the Patagonian chief with sevenfold horse-hide on his body and threefold on his arms, while such terms as "scale-armour" have always recognised the obvious imitation of the scales of animals by the armourer.

Among missile weapons, special attention

is here given to the class of "boomerangs," under which Colonel Fox includes not only the familiar Australian kind, but other flat curved missiles used by hill tribes of India, and in Africa. By the aid of a series of specimens he shows how mere sticks or clubs thrown at game or enemies would be improved by experience, being made thin and edged to fly farther, till at last the fact having been noticed that such a weapon will return to the thrower, boomerangs were often shaped with a view to this useful property. It appears that the boomerangs used by the Maravars of South India and by the ancient Egyptians, as well as those of the Australians, have the return flight; but this is not generally the case with the missile-blades of India and Africa. Colonel Fox is disposed to attach an ethnological significance to the fact that boomerangs, and also a particular class of parrying-shields, are found on the line of distribution of Professor Huxley's Australioid race, from Australia through South India to Egypt, as though these weapons had been a possession of the common ancestors of Australians, Coolies, and Egyptians. (There seems to be some misprint in p. 32, line 18, as to this matter.) To the writer of the present notice, however, the evidence of another class of weapons studied by Colonel Fox seems to tend against attaching too much ethnological value to the possession of some simple weapon by several remote races. The spear-thrower is a stick or narrow board used to hurl darts with, "having the effect of adding another joint to the arm of the thrower." This instrument, which greatly increases the force with which a spear can be thrown, is found among the Australians, the Esquimaux, the Aztecs, and some Brazilian tribes. But it may well have been independently invented in several places, and can hardly be taken as proof of any connexion between the races of America and Australia. This problem renews itself in the most complicated way in the attempt to trace the origin of the bow. Colonel Fox thinks he can trace the plain wood bow as having diffused itself over the world from two or three geographical centres, but cannot decide whether it originated independently in those centres, or was derived from a still earlier single source. But as to the composite bow, such as that of wood backed with sinew or horn, there is, he says, every reason to believe that it spread from a common centre somewhere in Central or Northern Asia. Now, as such bows appear among North American tribes, this involves the theory that North American culture was in part of Asiatic origin. These views as to the ethnology of the bow require careful consideration, but cannot at present be taken as established. The blow-tube for shooting tiny poisoned arrows by a strong puff of breath is found among native tribes in the two distant regions of South America and South-east Asia. Colonel Fox hesitates to say that the knowledge of the weapon passed from one district to the other in pre-historic times, but thinks that the fact of the arrows being poisoned and some of the blow-pipes being constructed of two tubes one within the other, in both regions, is an argument in favour of an ancient connexion.

As to the origin of the name of the instrument, French *sarbacane*, Italian *cerbotana*, the derivation given by Denin is quoted "from *Carpi* in Italy, the place where they were manufactured, and *cunna* a reed" (!) It is taken for granted by Colonel Fox that its South American name *zarabatana* was borrowed from the Europeans. But a comparison of the whole set of names would have most likely persuaded him that, on the contrary, it is the native American name which is original, *sarbacane* being only one of several corruptions of it.

The author's interesting argument is here stated as to the iron heads of arrows and javelins made with blades of an ogee section, so as to give the weapon a rotatory motion in flight. So deeply has this idea sunk into the mind of the native smiths, that with absurd consistency they will actually forge the blades of knives and swords in the same way. There is much force in Colonel Fox's argument that so remarkable a peculiarity indicates the art having spread everywhere from a common source, and the distribution of the double bellows for smelting iron may tend to confirm this view. If the inference is sound, the peculiarities of native iron-work prove an ancient connexion between the barbaric civilisation of Africa and that of parts of Asia and the Indian Archipelago.

EDWARD B. TYLOR.

On Early English Pronunciation, with especial Reference to Chaucer. By R. F. Weymouth, D.Lit., M.A. (London: Asher & Co., 1874.)

THIS book is an instructive and, we may say, warning example of the way in which linguistic evidence may be dealt with by a scholar who approaches his investigation with a ready-made *à priori* theory. Dr. Weymouth's theory is that the present pronunciation of literary English is substantially that of Chaucer's period—that the sounds of English have not suffered any very appreciable change during the last six centuries. As these views are directly the reverse of those laid down by Mr. Ellis as the result of his own laborious investigations, Dr. Weymouth's book naturally assumes the form of a polemic against Mr. Ellis, whom, while respecting his accuracy and industry, he accuses of faulty logic and want of proper method.

According to Dr. Weymouth, the fundamental defects of Mr. Ellis's method are his too implicit reliance on the statements of the old orthoepists and grammarians, his neglect of the living dialectal forms, and his maxim that "the orthography shows the sound."

All that the first objection amounts to, as far as we can see, is that the statements of the orthoepists are sometimes obscure, and consequently that it is often possible to interpret them otherwise than Mr. Ellis has done—a fact which Mr. Ellis himself would probably be the first to acknowledge. The second objection can hardly stand in the face of the fact that Mr. Ellis is at the present moment engaged in a most full and elaborate investigation of the pronunciation of our dialects. Until the results of his labours are laid before us it is idle to attempt

to settle beforehand what is the value of their evidence. It is quite clear that it will not do to take dialectal pronunciations at random which happen to fit in with any theory, and ignore the counter evidence. Even if all the dialects afforded precisely the same evidence, if, for instance, they all pronounced such a word as *house* with some variety of the diphthong *au*—it does not at all follow that Chaucer said *haus*. The dialects may all have changed independently, in accordance with the inherent laws of phonetic development—even if the simple (Italian) *u* had not been preserved to the present day in the English dialects of Scotland, Chaucer may still have said *huus*, and not *haus*, as Dr. Weymouth assumes. The most curious thing is that Dr. Weymouth is fully aware of all these objections to his theory, and indeed we cannot do better than quote his remarks (p. 79):—

"And now to return to the question started in §9: was there—or is there—a *tendency* in the Teutonic languages to change *ii* into *ai*? Many scholars suppose that in High German, Dutch, and English, the *ai* is simply a modern substitute for a more ancient *ii*. The mode of writing in early German, Low and High, favours this view; for the symbol was commonly *i*, and throughout Europe, England alone excepted, this stands for (the sound of) *i*; and it is supposed always to have done so. Now let us see what this theory involves.

"First, it involves the assumption that in far remote antiquity there was some one mother tongue from which alike the Teutonic and the Classic languages—we need not climb still higher up the family tree—were derived; and so long as it existed all words that we now sound with *ai*—'wine,' for instance, had *ii*. It is sufficient to say that this assumption, however plausible, rests on no foundation of history or tradition.

"Secondly, it assumes that both Celts and Scandinavians in the north, and the Latin and Hellenic races in the south, persistently adhered to the *ii*, and their *wiin* or *vin* remained immutable.

"Thirdly, that during long centuries, and whole millennia, the Teutons too—*tendency* notwithstanding—persevered with *wiin*, until they learned to write, adopting the Roman alphabet.

"Fourthly, that the Latin *i* was always *ii*, which is not certain, and can only be maintained by precisely such arguments as would prove the English *i* to have been always the symbol of *ai*.

"Fifthly, that after the Teutonic tribes had received the Roman alphabet—*post hoc*, not *propter hoc*—some of them, owing to this most curious tendency, came, at some period during the early Middle Ages, to change *ii* into *ai*: *wiin* no longer, but *wain*. Yet only some of the Teutons made this change: most of the Hollanders, the Frisians, and the peasantry who speak the Platt-Deutsch, retain *ii*."

If we omit from this passage all the expressions of doubt and depreciation, it would be impossible to find a clearer and more satisfactory statement of the views universally accepted by the philological world—with the exception of Dr. Weymouth and the unfortunate schoolboys who have his extraordinary Chaucerian pronunciation drilled into them. How Dr. Weymouth, with the facts of comparative philology staring him in the face, can persist in agreeing with Mr. E. A. Freeman (whom he facetiously terms a "brother barbarian") that the Anglo-Saxon *i* was "certainly sounded as it is now," is a mystery even more insoluble than the change of *wiin* into *wain*.

In his anxiety to escape from the dreaded *wiin*, Dr. Weymouth has recourse to the most desperate and farfetched arguments, quoting Lipsius's defence of the English diphthongic pronunciation of Latin *i* in *rēgina*, &c., inferring, on the strength of an isolated Norman pronunciation, in which *joli* is *jolai*, that *i* final was *ai* in French, and finally wandering off to the Greek *oivos*, of which he says—

"Some scholars believe that in the *oi* of *oivos* the *o* is merely a variant of the digamma, and that *Fivos* is the old form, and points to *wiin*. But ancient inscriptions show us the *f* and the *o* both used in such words. In Boeckh's *Corp. Inscr. Gr.*, No. 4, we have TAN FOIKIAN: which, being confirmed also by other inscriptions, conclusively shows that in that word at least—very probably therefore in others like it—the *f* was not followed by the pure sound of *ii*."

In his table of contents Dr. Weymouth calls this "a ray of light from an old inscription in Aeolic Greek." We are unable to see anything but Cimmerian darkness in his arguments.

We are equally at a loss to understand the third objection. The maxim that "the orthography shows the sound" would certainly prove "delusive" if applied to the present forms of such words as *knight* or *wright*, but the principle was never supposed to hold good universally. Mr. Ellis only claims to have established that before the rise of printing the scribes wrote not by eye but by ear, and that, although the values of the letters were necessarily traditional, their use in expressing the actual sounds used by the writer was not so, but was guided by ear. If the orthography of dead languages were no guide to their sounds, we should simply have to give up the study of historical phonetics altogether, except where we have the contemporary evidence of grammarians and orthoepists.

It need scarcely be said that Dr. Weymouth fails to carry out his views consistently. If there is a point in which all the English dialects agree, it is in rejecting the final unaccented *e*. I learn from Mr. Ellis that he has not found a trace of it anywhere remaining. If, then, Dr. Weymouth assumes a Chaucerian *haus* against the testimony of the Scotch *hus*, he is surely bound still more to assume that Chaucer pronounced *some*, *time*, &c., as monosyllables—and yet he makes these words dissyllables whenever the metre requires it. He departs from the present pronunciation of literary English in several other instances, and altogether it is difficult to see the value of a tradition which, by his own showing, has so frequently gone astray as to require constant theoretical modification.

The paradoxical nature of Dr. Weymouth's theories is the more to be regretted, as he has otherwise shown considerable sagacity and historical knowledge, and in some important cases really seems to have convicted Mr. Ellis of error. We allude particularly to the question of the two *os* and *es* in Chaucer. Dr. Weymouth argues very justly that if we find *u* and *o* distinct in Anglo-Saxon, and their modern representatives *oa* (*o*) and *oo* still distinguished in pronunciation as *oo* and *uu* (*hoom*, *duum* = A.S. *hām*, *dóm*), there must also have been a distinction in Chaucer's

time, and he finds accordingly that the two *os* are hardly ever rhymed together by Chaucer and his contemporaries, except in the case of proper names, whose pronunciation was not fixed. We cannot, of course, follow Dr. Weymouth when he goes on to assume that the two *os* in Chaucer's time had exactly the same pronunciation as at present, but there can be no reasonable doubt that he is right in protesting against Mr. Ellis's confusion of the two sounds.

We have not space to criticise any further the details given by Dr. Weymouth, although many of his observations, especially of dialectal usage, are of considerable interest. The book deserves the attention of all students of English—even those who are fully convinced of the erroneousness of Dr. Weymouth's views will find in it much to instruct, and—we may add—to amuse them.

HENRY SWEET.

A BUDGET OF PARADOXERS.

THE student of paradoxical literature has reason to deplore the untimely death of Professor De Morgan. Though their genial and talented historian is dead, the race of Paradoxers continues to flourish. Three books we have lately received make us sigh for a continuation of the *Budget of Paradoxes*. It will be seen that mathematics and theology can no longer assert an exclusive right to this department of human ingenuity; a rival has entered the field in the shape of philology. First and foremost comes Professor Piazza Smith's *Our Inheritance in the Great Pyramid*. The inheritance, it is true, has been disowned by the leading scientific men of our degenerate day, and the Royal Society has refused to allow any light to penetrate to it from the windowless chambers of the Great Pyramid; but Professor Piazza Smith does not weary of his mission to an unbelieving world. However, the Egyptologists are as blind—the Professor insinuates wilfully so—as the Fellows of the Royal Society, and in the inspired monument of "heaven-descended" measures they can see nothing but a stone sarcophagus. Nevertheless, let the Professor go on preaching his new creed—that the Great Pyramid was constructed under the eye of Melchisedek as an enduring monument of Divine weights and measures, to be revealed to the Scotch astronomer of the present age, when the atheistic decimal system of revolutionary France threatens to upset religion—and he will certainly gain converts. The volume runs to 518 pages, including appendices; and if hard words can destroy "Cheops' coffin" and its defenders, the Professor has accomplished his purpose.

An equally remarkable book, though of a somewhat contradictory tendency, is *The Primitive and Universal Laws of Language*, by Count C. A. de Goddes-Liancourt and Frederic Pincott. These laws are "founded on the natural basis of onomatopoeia," a word perhaps more useful than ornamental. The authors are convinced that by extracting from various dictionaries, ancient and modern, a number of words not more unlike in sound and meaning than *crab* and *fleece*, *law* and *to lick*, and throwing them into one heap, it is possible to arrive at the "onomatopoeic" roots of language, it being understood "that any letter may interchange with any other letter." To one uninitiated in the "primitive and universal laws of language," these roots may seem rather vague; but then vagueness is the essence of "onomatopoeia." We confess to having been taken aback at first at being told that *world* and *earth* are both "forms of *or-b*, Latin," and that "the Semitic languages entirely ignore" the vowels; but on reflecting that the meaning and connexion of the first two pages of the volume are still a sealed mystery to us, we

ceased to wonder at our "state of blessed ignorance." For the benefit of the initiated, however, we may add that the conclusion arrived at by the authors is not only that "man spoke before he reasoned," but that "there is no natural and intrinsic difference between the sounds of the brute and the words of the man;" though why the first of these sentences should be printed in capitals, and the second in italics, is again one of those things we are unable to comprehend. The last book in our budget is one by M. de Charencey, on *De Quelques Idées symboliques se rattachant au Nom des Douze Fils de Jacob*, reprinted, by the way, from the Transactions of the Société Philologique. M. de Charencey sees in the twelve sons of Jacob the twelve signs of the Zodiac, and this, too, in the interests of the Church. Whether the Church will approve of the fashion in which its interests are cared for may admit of question. M. de Charencey, however, cannot lay claim to the merit of originality for his discovery, since Sir William Drummond endeavoured, though unsuccessfully, to impress it upon the world some fifty years ago. What is original is the mystical connexion that is shown to exist between the stones of the High Priest's breastplate and the vision of the Apocalypse and the Zodiacal patriarchs. Various shades of colour, moreover, are denoted by the latter, reminding us of certain theories of Swedenborg. When Joseph told his dream to his brethren, he can have had little idea how useful it would be to modern theologico-philologists. It is a pity that the dreams of other paradoxers cannot lay claim to so respectable an antiquity.

A. H. SAYCE.

NOTES AND NEWS.

M. J. VIOLE recently explained to the French Academy some experiments designed for the purpose of estimating the temperature of the sun, which he reckons at $1,354^{\circ}$ C., without, however, allowing for the loss occasioned by the absorption of the earth's atmosphere, but for which his apparatus would have been more strongly affected and the estimate would have been higher. His paper called forth very interesting remarks from M. St. Claire Deville and M. Berthelot as to the limits beyond which increase of temperature could not be obtained. M. Deville observed that it was not prudent to speak of higher temperatures than had been actually measured, those measured by M. Biinsen being the highest known. The heat resulting from chemical combination was limited by the temperature at which dissociation occurred, and which, according to his experiments, never exceeded a measurable quantity. When the pressure was augmented, under which two gases combined, there was usually an augmentation of the temperature produced, but the experiments of Professor Frankland, M. Cailletet, and his own, proved that the light which was disengaged increased faster than the temperature, and that the chemical rays augmented rapidly in number and intensity. It might then be supposed that combinations occurring under increased pressures would exhibit energy, not in the form of heat, but in waves of shorter lengths, and that a limit would be reached, beyond which no calorific effects would be produced. M. Berthelot observed that as long as the law of Mariotte was considered absolute there appeared no limit to the temperature simple gases might be made to assume, unless it was supposed that they were transformed into something still simpler, or into the universal ether; but practically it might be found that radiations of all kinds augmented so rapidly with increase of temperature that no temperature would be realisable beyond $2,500^{\circ}$ C. or $3,000^{\circ}$ C., as observed in the experiments of M. St. Claire Deville. Equality of temperature and of pressure of two identical masses of gas did not necessarily imply identity of those vibratory movements which correspond to luminous or chemical radiations. One such gas might appear yellow, or red,

and chiefly emit luminous or calorific rays, while the other might be blue or violet, and emit more chemical rays. They would then be in a state of equilibrium of temperature, without being in the same physical conditions. Two such masses might be compared to musical instruments emitting sounds of equal force, but composed of different harmonics. In experiments he had made with carbon heated in an atmosphere of hydrogen, first with a strong galvanic battery, and then with solar rays condensed by a polyzonal lens, the effects were at first identical; dark red, bright red, reddish-white, and dazzling white, but as the temperature continued to increase, they became different. With the electric current, the carbon passed from dazzling white to the blue so well known to persons accustomed to electric illumination; but in the solar focus the change was from dazzling white to rose, which corresponds with a higher temperature, close to that at which platinum melts under very powerful lenses. Would gases treated by different means afford analogous results? M. Berthelot also referred to experiments he had made in compressing gases, contained in a strong steel tube, by forcing upon them a piston impelled by the fall through a space of from 1 to 5 mètres of a ram weighing 500 kilogrammes. If all the mechanical force had been transformed into heat, the result would have an elevation of several hundred thousands of degrees. Carbonic oxide and oxygen were made to combine, but about one-fifth of the mixture remained unaltered as if the temperature had almost reached that at which the dissociation of carbonic acid occurs; pure carbonic acid, however, was not changed. Protoxide of nitrogen resisted or suffered decomposition according to the conditions of the experiment. Olefiant gas did not suffer appreciable decomposition.

To resume, M. Berthelot said, "It is not possible to communicate to matter an active force to an extent without limits: no instrument can be made to give an indefinitely augmenting sound; no projectile can be made to acquire an indefinitely increasing velocity of rotation, or translation; but we are not able to assign with any probability, derived from our own experiments, what may be the limits of temperature in a body differing as the sun does from the conditions we are surrounded with."

The above is a free and abridged translation of remarks which will be found at length in *Comptes Rendus*, 1874, 1 Sem. p. 1816, et seq.

THE second number of *Anthropologia* for 1874 (published by Messrs. Baillière, Tindall, and Cox) begins with the report of a paper read before the Society by A. H. Kiehl, F.L.A.S., on the Natives of New Guinea and of the neighbouring Islands, such as Misori, the Admiralty Islands, New Britain, &c. The author did not profess to consider the question of the ethnological characteristics of the race, but simply described the appearance, habits, and customs of the people as they presented themselves to him; and his paper has, therefore, no scientific value beyond the fact of its adding materials derived from direct observation to the general mass of our knowledge. In the discussion which followed the reading of this paper, the president, Dr. R. S. Charnock, F.S.A., drew attention to the distinction between "Papuanas" and the so-called "Alforas," the former people being named by the Malays "Papuah" from their frizzled hair; and the latter, who have straight long hair, having derived their name from the two Portuguese words "al," the, and "fora," outside, or the outsiders—i.e., foreigners. While the Papuans occupy the western coasts of New Guinea, the Alforas are settled on the eastern sides of the island, although they are also found in the interior. In language, habits, appearance, and character, the two peoples differ widely, and it is probably to these marked differences that we must refer to the uncertainty and contradiction which characterise the descriptions of early discoverers, who were

ignorant of the existence of two distinct races on the island.

In a paper on the Prussians, Dr. Charnock regards the nation from a point of view which in its generally low standard would undoubtedly gratify M. de Quatrefages and others who share in his opinions, for while he considers the ancient Prussians to have been dull and heavy, he thinks their modern representatives domineering, coarse, and selfish, not remarkable for veracity, and real Shylocks in money matters. Their culture he believes to be more apparent than real, their literature borrowed from England and France, their morality low, and their religion a hybrid between superstition and scepticism. Such decidedly antagonistic views of the dominant German race not unnaturally drew forth some strong expressions of counter-opinions, and a more unanimous approval seems to have been awarded by the members to the next paper read by the President of the Society, on "the Wends of Bautzen." Here Dr. Charnock enumerated the various branches into which this ancient race had split in the Baltic and other North-German lands, and considered in detail the names, positions, and conditions of the remnant which still preserves its ancient peculiarities of language and habits. According to the author, the Wends of Bautzen—a town 31 miles E.N.E. of Dresden, differ considerably in physique from the Germans, having broad skulls with a cranial index of from 80 to 88, and being taller, fairer and stronger; while their language shows an unmistakeably close affinity to the Slavonic tongues.

The very comprehensive paper read by Mr. Wake before the Society, on the Hetaerae of ancient Greece, and the worship of Venus or Astarte at Cyprus, of Adonis at Byblos, &c.; and that by the President on "Polyandry" as it existed in primitive ages, and as it is still to be met with in the Aleutian Islands, on the shores of Okhotsk, and other parts of Asia, called forth a lively discussion, in the course of which Mr. A. L. Lewis's "Notes on Polygamy" were also canvassed, and the entire range of the kindred subjects discussed in these three papers was considered on ethical and social grounds. At a later meeting Dr. Wake read a paper on "Marriage among Primitive Peoples," in which he passed in review the opinions advanced, and the lines of argument followed, by Mr. McLennan, Sir John Lubbock, and Mr. Morgan; but although he is not disposed to adopt the views of any of these well-known authorities, he is scarcely prepared, it would seem, to offer any more definite hypothesis in regard to the much-discussed question of the origin of communal marriage.

The second paper contributed by Mr. A. L. Lewis seems to us out of place among the printed Transactions of the Society, partly because it was not original, having been read before the British Association at Brighton, and partly because its object, viz., the refutation of the alleged identification of the English nation with the "Lost House of Israel," would appear to be scarcely worthy of the attention of a scientific society in these days.

In a somewhat dull article Dr. Inman discusses "The Causes which determine the Rise and Fall of Nations," and which he finds in the "just commingling of the animal and the intellectual qualities of man." He considers that a great deal of mawkish sentimentality is talked in regard to the disappearance of savages before the white man, which he simply regards as the inevitable result of human intelligence overcoming human brutality. The question still remains, however, whether anything can justify civilised man in asserting the pre-eminence of his intelligence by manifesting so much of the brutality that has hitherto too often characterised his dealings with savage tribes. Dr. Kaines, in a paper on "Western Anthropologists and Extra-Western Communities," which, by the way, had also been read at the meeting of the British Association at Brighton, considers the question of the advance of

civilisation from an ethical point of view, and regarding Auguste Comte as the profoundest and wisest of modern anthropologists, he maintains that progress should be subordinate to morality, and that the time has come when "Commerce, as we Westerns understand and fashion it," should cease to bring not peace but a sword. In his general condemnation of the policy employed by Western nations in colonizing the archipelagoes of the East and the continents of the New World, he makes an honourable exception in favour of the Danes in Greenland, who "do not forget altogether the ties that bind men of different kindreds in a common brotherhood." The discussion on these papers, which were written by men holding the widely different views of Christianity and Positivism, led to some controversy as to the extent to which subjects of anthropological interest should be treated with relation to moral and humane considerations. Another paper by Dr. Kaines, on the Importance to Anthropology of a true Cerebral Theory, called forth an equally animated discussion on the value of Gall's doctrine, which the writer highly eulogized, and the merit of Dr. Ferrier's researches, which he regarded as much over-rated.

In the Anthropological Section of the French Association of Science, recently sitting at Lille, Dr. Gustave Lagneau discoursed on the "Ethnogeny of the Populations of the North of France." His conclusion was, that after, and perhaps before, the Polished Stone age, there were two principal races incessantly intermixing, and giving rise to the existing population of the district. One, a Celtic race, with a more or less rounded sub-brachycephalic head, short face, brown hair, and moderate stature, which anciently occupied chiefly or exclusively the northern region, as it now occupies chiefly, and almost exclusively, the centre and north-west. The other race, true North German, with a long head, high face, light hair, blue eyes, remarkably white skin, and large bones, appears to have been represented at least in the Neolithic epoch, and to have constituted the Gauls (*Gaëls*), Belgians, Cimbrians, Germans, Saxons, and Franks, who successively immigrated into the northern region, subduing or driving back the anterior Celtic race.

In the course of a discussion on this paper, M. de Quatrefages observed that women preserve ancient types more than men, and he mentioned finding in Antwerp some short brachycephalic prognathous brown-haired women of the type of the remains in the grottoes of Furfooz.

In the same section M. de Mortillet argued that dolmens were not characteristic of any special migratory race. There were, for example, isolated groups of dolmens in the Crimea and in Palestine, which could not be explained by a theory of migrating builders. Although dolmens had certain characters in common, their details varied in different countries, and they were the works of sedentary populations sufficiently distinct to have different habits. Variations were often found in districts close to each other; thus, in Brittany the dolmens are chambers, or caves with long entrances (*couloirs*), while in the environs of Paris they are long and broad covered ways preceded by short vestibules; and in Lozère, l'Aveyron, le Gard, and l'Ardeche they are simply rectangular kists of large dimensions. The dolmen was only a derivative from the sepulchral cave, and constructed artificially to meet the increasing demand for burial-places. An examination of the remains in caves and in dolmens of the same epoch showed an identity of funeral customs. Le Gard exhibited characteristic transitions between caves and dolmens: M. Aurès had shown at Aubus-sanges a natural sepulchral cavern closed after the manner of the dolmens of the district; and M. Cazalis de Fondouce had described and figured the hybrid sepulchres of Cordes and Castillet in the commune of Fontvielle, which are half natural cave and half dolmen.

M. Broca discoursed to the same assembly on the Geographical Distribution of the Basque

Language, which was the most ancient in Europe, and apparently autochthonous. Before the introduction of Aryan languages, numerous European tribes spoke different, but more or less affiliated dialects, which gradually disappeared before the Aryan tongues, and only the Basque now remains. Before the Romans, Iberia was only conquered by Celts and Carthaginians, and Iberic is neither a Celtic nor a Phoenician language, and the ancients made no distinction between the Iberians and the Vascons, or Cantabri, ancestors of the Basques. The opinion of Humboldt is thus confirmed. The Basque language retreated before the Roman invasion, and we see it disappear in Aquitaine and Spain, only the tribes of the Pyrenees backed by the Gulf of Gascony preserved it.

Perhaps, also, it was retained by the tribes cantoned between the Adour and the mountains, but the existence of the Basque language in this region may have had another origin. In the fifth century the Visigoths tried to subdue the Spanish Vascons, who lost part of their territory, and many emigrated, passing the Pyrenees, and forcibly established themselves as far as the banks of the Adour. In 602 they obtained from Thierry II., King of Burgundy, the cession of this territory. This was a veritable Basque colonization, and from this epoch may be dated the return of Basque to the north of the Pyrenees. The Spanish Basques are dolichocephalic, the French brachycephalic, and as no brachycephalic race has come into French Vascony within historic dates, nor any dolichocephalic race in Spanish Vascony, this ethnic division must date from prehistoric times. The Vascons retained their conquest, and, under Louis le Debonnaire, they extended it to Narbonnaise; but after the death of their great chief, the Duke of Loup, their possessions were divided into three parts among his sons and heirs, forming the counties of Bigorre and Bearn, and the duchy of Vascony. Subsequently the Vascon element declined before the Gallo-Roman element; the language disappeared before a patois of the langue d'Oc, the inhabitants of the two counties abandoned the name Vascon, and called themselves Bearnais. The district named Vascony, owing to the excursions of the Vascons beyond the Adour as far as Dordogne, was transformed into Gascony, and the Vascons of the Pyrenean valleys, changing V into B, took the name of Basques.

In France the line of demarcation between the two languages is very sharp. Except in three villages near Oloron, where certain families teach their children both Bearnais and Basque, there is no point of transition between the two. An ordinance of Charles IX., enjoining the inhabitants of Biarritz to employ French instead of Bearnais as their official language, proves that place to have been no more Basque then than it is to-day. Not long since Puente de la Reyna was a locality in which both Basque and Castilian were spoken; and it was the same near Pampeluna; but there is no such spot of transition in France.

In the Medical Section of the French Association, M. Cuignet read a paper on "The Sequel of Fractures caused by Projectiles," and contended that amputation had led to more deaths than "expectation" and conservation, even in complicated wounds of the thigh, knee, and leg. He considered that amputation should be reserved for extensive mutilations, and not resorted to in the greater part of comminutive fractures of the limbs. M. Ollier, while agreeing with the principle of conservation, could not accept M. Cuignet's conclusions, as they were drawn from an examination of the cases of survivors, and consequently did not include cases of deaths after abstention from amputation. M. Laussedat related instances in his own practice at Brussels during the last war, which were in favour of abstention. In thirteen cases of very serious fracture of limbs, aggravated by the absence of all treatment and successive journeys, for several weeks the results were most fortunate. In particular, he mentioned a case

of a foot smashed by a shell, another of a ball in the sole of the foot, which had remained there a long time, and another of comminutive fracture of the leg. These results were the more remarkable as all died in a neighbouring ambulance where amputation had been easily accomplished. Other speakers alluded to a different experience. M. Trélat spoke of the moral causes that influenced results. After the battle of Mouzon, a few days before Sedan, all the wounded made wonderful progress, operations and abstentions alike succeeded. Then came the Prussian occupation, requisitions and privations. The moral conditions changed; gangrene, &c., appeared, and cures were no longer expected. More detailed accounts of the various matters brought before the French Association will be found in the *Revue Scientifique*, from which the above are taken.

HERR DOVE, in a communication to the Academy of Sciences at Berlin, remarks that, in our latitudes, the difference of temperature between polar and equatorial winds is much greater in winter than in summer. It is thus evident that a study of the simultaneous distribution of heat during the winter months is particularly favourable to determining the thermic effects of air currents. The results arrived at show that when the temperature falls suddenly in the last third of December, it is generally, though not always, an indication of a mean and steady temperature in the January of the following year. Precocious winters with frosts in November and early part of December, usually indicate that the ensuing month of January will be mild, and, on the contrary, warmer weather in November and December announces that the approaching winter will be severe.

In an address to the French Association of Sciences at Lyons, Colonel Laussedat, reviewing the work of that body, mentioned that M. Jacquemin had found that hypochlorite of soda with a drop of aniline was a good test for phenic (carbolic) acid, immediately producing a powerfully blue salt, erythrophenate of soda.

He also said that the experiments of Professor Chauveau on young calves proved the transmissibility of tuberculose through food. Out of 100 sucking calves, the offspring of sound parents, he could not discover the slightest trace of tuberculosis, while 100 similar calves fed upon food containing the infectious matter were all found diseased in the course of six weeks or two months.

He likewise mentioned that Dr. Ollier, having studied the effects of traumatic irritation in augmenting or diminishing the length of growing bones, had made some successful experiments in treating the deformities of children from six to twelve years of age.

FINE ART.

Die Bildwerke des Parthenon und des The-seion. Von Heinrich Brunn. [Aus den Sitzungsberichten der Philosophischphilologischen Classe der Akademie der Wissenschaften.] (München: 1874.)

THE discussion as to the subject at large, and in detail, of the Sculptures of the Parthenon has now been continued so long, and has elicited such a variety of opinions and theories, that the larger world, which is interested in it without pretending to take part in it, may reasonably be impatient for some reasonably satisfactory conclusion—or, at least, for some impartial summing up—if the end of it all must necessarily be that nothing can ever be concluded. The time for this final word usually declares itself as ripe when, after all that is plausible and much that is sagacious and ingenious

has been advanced upon a question, every new enunciation is manifestly prompted by little more than a resolution to have some part in the debate, or to say something that shall at least be novel, however desperately wild or however hopelessly rapid. The regard that has been accorded to Heinrich Brunn as a contributor to the history, and a collector of the notices, of the Greek sculptors, bespeaks attention for his recent essay on *The Sculptures of the Parthenon and the Theseum*. A survey of his exposition to the extent that our limits admit will perhaps enable us to decide in which category—whether of useful or of superfluous contributions to a literature already becoming overlaid and cumbrous—it is to find a place; whether it may be accepted as conclusive in itself, or is not rather to be taken as a sign that the elements of investigation have been already exhausted, and that the time has come for a conclusive decision; failing which, an audience which has continued attentive only with some difficulty hitherto will infallibly, and not inexcusably, disperse.

For the sculpture in the Eastern pediment of the Parthenon we have only the brief notice of the traveller Pausanias, that "the whole has reference to the birth of Athene;" and then the preserved statues of the terminal groups at either angle. Of the central group not a fragment nor a record remains, and conjecture has an open field as to the figures that were introduced, their composition and occupation. The only limitations are consistency with the words of Pausanias, with the best interpretation of the "business" of the terminal groups which contrast with the better-known composition of the Western pediment, and, lastly and above all, with the poetic dignity of the occasion. One possibility of assistance lies in the recognition among ancient monuments of some figures that have an appearance of repeating members of the lost group.

Of various schemes of restoration of the most important group of the most important sculptural composition on record, the chief are these: Zeus is seated in the centre under the apex of the pediment, with a small Athene above, as if at the moment of issuing from his cleft head, as shown on some vase paintings—a theory which probably died with its expositor. Then Zeus has been enthroned full face in the same central place, with Athene of full size beside him. The opponents of this view had at their command the objections that a seated figure would be too low for the loftiest place in the pediment, and that in any case there was not depth for the projection of a figure of the requisite scale, when so presented. Another conjecture sees Zeus seated aside from the centre, while Athene, the central figure in the front pediment of her own temple, rushes forward erect, full armed, with the gesture which is ascribed to her on the occasion in the Homeric hymn, and that is recognised in a statue that is found frequently repeated in the Museums, and is not the less significant because usually of execution far inferior to design.

With such a conception of the main incident the terminal groups are found in harmony on this wise. Helios rises with his

horses from the ocean waves at one narrowing extremity of the triangular composition, and Selene with hers is about to sink below the horizon at the other. The intermediate space is thus indicated as the cope of heaven; the scene of the birth is elevated to the imagination far from lower earth; the incident represented becomes not local in any sense, but cosmical.

These two names at least have not hitherto been called in question, and are left undisturbed by Brunn. Triplet groups then succeed at either end, which may truly be called and considered terminal, as associated with Helios at one side and Selene at the other, and from the moderate though gradually awakening excitement that they display in contrast with the adjacent figures that are nearer to the great event.

The three goddesses next to Selene—so proceeds the explanation we are now concerned with—are the Fates, the daughters of Night (appropriately on this side), who are constantly present in ancient compositions at momentous births, and are sometimes grouped correlatively to the Horae, or Seasons, sometimes to the Graces, or Charites, when associations are willingly extended to cosmical range in both time and space. The sister seated nearest to the centre looks towards it as she rouses the attention of the second with her hand on her back; and the second, with movement as about to rise, disturbs the third, who has been leaning against her extended in repose, and now just lifts one hand. The gradation of movement in this group—of progress from insensibility of sleep to attention, to lively interest—is even as exquisite as the execution and indication of the nude, and the infinite delicacy, the *ἀνιρθμον γέλασμα*, of the drapery; and all remain unrivalled amidst whatever is beautiful in art of which the world enjoys possession.

The attention of the sisters has been roused by the movement of Nike—Victory, a winged figure, that springs forward with elevated arms; some metal fastenings about the figure appear to prove that she carried the floating taenia with which on the vases she is seen sometimes greeting Zeus and sometimes the new-born Athene.

At the opposite angle of Helios, the approach of a lighter female figure in rapid motion—her bellying peplos, of which most is broken away, is the analogue of symbols that identify Iris on various monuments—is recognised by the nearest of two seated goddesses, and yet with a sobriety of action that supplies the notion of still intervening distance, while the second is even yet scarcely conscious of interruption for the forthcoming announcement. These two figures are manifestly paired: they are not only in communication, but the arm of one is on the shoulder of the other; yet their proportions do not indicate the relation of mother and daughter, and as Demeter and Persephone are thus excluded, we are cast for the cosmical propriety by which they would be, as is required, correlatives of the Fates, on the Horae and appropriately on the Attic seasonal goddesses, who were a pair—Thallo and Karpo, the powers of germination and of fructification. That the reclining male figure, who is associated with them by position, and faces the rising He-

lios, can only be Dionysus, their constant associate on monuments and in mythology, seems then to follow of course, and is quite consistent with the skin on which he rests, and with the analogy of his attitude, not only with the unquestioned Dionysus of the monument of Lysicrates, but many others.

The combined artistic and poetic differentiation (if one may be allowed what was "an excellent good word till it was ill-sorted") of these complete terminal groups is a marvel of genius; what must not have been the gloriousness of the central composition that united both, and by the culmination of which even this achievement became subordinate!

As regards the moment chosen for the central incident, we have seen that the moment of the birth has been pretty generally set aside for the moment after it, when Athene rushes forward fully armed amidst the assembly of the gods. Either conception will harmonise sufficiently with the sudden diffusion of interest and excitement and agitation to the very extremity of the universe, that would seem expressed beyond all ambiguity in the still existing groups. This, however, is not the opinion of Herr Brunn: he chooses the moment before the birth, when the axe of Hephaestus is just raised, and in consequence excludes Athene from appearance in her own pediment. Surely we are called upon to make the fatal step from the sublime to the ridiculous—from Pheidias to Lucian—when we are invited to watch with the assembly of the gods how Zeus comports himself as he awaits a blow on the head from the axe, all golden though it be, of the Titan Prometheus or his own son. On the other hand, the significance of the astral terminations of the composition is recognised by Brunn, though with a decision which rather suffers when he interprets the beardless reclining youth as representative of Mount Olympus. It can be but by misconception, as desperately enough in any case, that a plea for a mild and temperate ideal is supported by the description of Olympus in the *Odyssey* (vi. 43 ff.): a description which scarcely has reference to the mountain at all, but rather to the general indefinite region above and independent of it, far beyond all accidents of weather, the proper abiding place of the immortals; the Olympus that in the *Iliad* is identified with the "great heaven," and has the same portals.

"He is not resting here," he says, "incidentally and for the moment, but occupies, on a prepared couch, a wild beast's skin, his established permanent seat: and this repose and permanence are even expressed in the entire figure; its assured attitude as well as its vigorous unassailable forms contrasting as a structure of rock to the flowing lines of the river god of the western pediment."

The pair of associated goddesses are allowed as Seasons, with a reference to their function in the *Iliad* (v. 749), of opening the gates of the great heaven and Olympus—that accounts for, without justifying, the previous unhappy identification of the mountain.

Far more gratuitous appears the reduction of the dignity of the Triad of Fates to the very secondary constellation of Hyades, to

whom they do not answer even in number; the references to Hesiod (frg. 67), and Euripides (Ion, 1146 ff.), are given with praiseworthy candour and courage also, for assuredly they fail to vindicate a conjecture, much less to supply an argument.

The Iris, of acception scarcely challenged hitherto, is interpreted as Hebe, from resemblance to a figure on the frieze of the Temple of Victory, which from proximity to a seated goddess, supposed to be Hera, is supposed to be Hebe. Upon this hint Herr Brunn advances to some reconstructive conjectures. As Hera implied Hebe on the frieze, Hebe implies Hera on the pediment; and Hera—naturally remote from Zeus on this occasion—implies her son Ares; then there is an equal propriety in Poseidon, as the future rival of Athene for possession of Attica, being likewise remote; he is placed therefore antithetically to Hera next to the so-called Hyades, with a Nereid, or perhaps Iris, on his part for attendant, while Apollo conjecturally associated on the Eastern frieze with a conjectured Poseidon, is on that account to be fairly introduced on this side to answer to Ares on the other.

Truly a critic might feel himself here involved in the meshes, but that the network breaks as easily as a spider's. Many another such "slight self-pleasing web," it is to be feared, will yet have to be broken "in vain" before the world has rest and can confide that what is given as a clue through a maze of admitted uncertainties does not simply conduct to pitfalls and precipices. Be it enough to remark, that these conjectures rend the composition of Pheidias, even where most absolutely authenticated, without moderation or mercy. The Iris, or Hebe if you please, could only be brought into association with a seated Hera by tearing her away from the place next to the Horae, which she occupied from the age of Pheidias to that of Lord Elgin. It is on record that the torso of the Victory was found on the cornice of the East pediment, and the figure combines admirably, both in import and composition, with the assigned place; yet Brunn removes it to the Western pediment, and to a place where, with another figure in front of it, there could not possibly have been space for the bronze wings which the mortise-holes remain to testify.

It is to be feared that this notice has involuntarily become more ungracious than there was any intention or desire to make it; than it was expected it would have been when the explication of the Eastern pediment was taken for examination in preference to that of the Western. But "ich kann nicht anders," and perhaps it is as well, if criticism is ever to do more with this grand subject, than "write about it, Goddess! and about it."

W. WATKISS LLOYD.

NOTES AND NEWS.

THE project of a National Museum of Arms at Birmingham, which we mentioned some months ago in the ACADEMY, has been carried out, and the Museum is now open to the public. It contains a valuable collection of the arms of all ages and nations: a collection chiefly formed by the Cavalier Callandra, a member of the Italian Parliament, who devoted twenty years of his life to the work. Some years ago these arms were

offered for sale in Italy, and after a lively competition on the part of Prince Napoleon, were eventually bought by Mr. John Marshall, of Leeds, who has now sold them to the wardens of the Birmingham Proof House, for the purpose of founding this Museum. The Government has also presented to it about eighty specimens of arms and a case exhibiting all the processes in the manufacture of the Enfield rifle.

UNDER the title of *Kunstgeschichtliche Findlinge*, Anton Springer has extracted for the benefit of the readers of the *Zeitschrift für bildende Kunst* the substance of a number of documents relating to Pietro Perugino, originally published in the second volume of the *Giornale di Erudizione Artistica*. These documents refer more especially to the time when Raphael was working under the Umbrian master, and are important as tending to show that he probably went to Florence at an earlier date than is usually assigned. Perugino, it is proved, must have been already established there in 1502. Unless, therefore, Raphael separated from him after two years' study in his school, and remained in Perugia alone, a circumstance that does not seem likely, considering the long-continued influence exerted by Perugino over the style of his great pupil, we must suppose that the two masters worked together in Florence before 1504, the date hitherto supposed to be that of Raphael's first visit to that city. We do not gain many personal details concerning Perugino from these documents; they relate chiefly to commissions with which he was entrusted, but such little traits as are accidentally revealed tend rather to confirm Vasari's unfavourable estimate of his character. He was evidently greedy after commissions, and unpunctual and careless in executing them.

THE authorities of the National Art Gallery, now in course of formation at Melbourne, have acted on the wise principle of applying the limited funds at their disposal to the purchase of good works by modern painters, rather than to the acquisition of second-rate and, as would often happen, spurious pictures by the old masters. A set of photographs from the pictures in the Melbourne Gallery that we have recently received, enables us to judge of the selection that has been made, and to congratulate the members of the Fine Arts Commission, to whom the formation of the gallery is chiefly due, on the success of their scheme. Although no picture of any great reputation has as yet been gained, we find several excellent works by well-known English artists that cannot fail to interest students in the colonies who have not Royal Academy exhibitions every year to satiate them with the productions of our English school of painting. We would advise the Melbourne Gallery, however, not to limit itself to the works of English masters, as it has mostly done hitherto, but to endeavour in its next purchases to obtain good representative works of the French, Belgian, and German schools. A variety of style is especially desirable in a gallery formed, as this is, for the purposes of education. The photographs have been taken directly from the original pictures, and are published by the authority of the trustees. They have been coming out for more than a year in monthly parts, and now form an interesting series. Each photograph is accompanied by descriptive letter-press, written by the secretary, Mr. Marcus Clarke, in a lighter style, and with far more information than is usually to be found in the letter-press supplied to picture-books of this kind.

BESIDES the Melbourne National Gallery before mentioned, the sum of 500*l.* has recently been voted by Parliament towards the formation of a picture gallery at Sydney. This sum would not, one would imagine, be likely to cause any great *embarras de richesses*, still the question has arisen as to the best mode of disposing of it—how to get the most, in fact, for the money. A sensible suggestion was made by Mr. J. E. Thomas at a

meeting of the Council of the Academy of Arts in Sydney. He advised, it is reported, that instead of attempting to gain possession of any original painting, the money should be devoted to the purchase of two or three good copies of well-known masterpieces that could be procured at a more reasonable rate. The French attempt at a *Musée des Copies* certainly proved a failure, but the idea was a good one, and if properly carried out would possess great interest, especially in the colonies. The difficulty is to procure really good copies of great works of art. This task requires a sympathetic artist, and not a mere servile copyist.

THE last eccentricity of the great art-critic of the present day is setting up a tea-shop! Subscribers to the *Fors Clavigera* have lately received, from Mr. Ruskin's Kentish publisher, with their copies, a card with the name "Harriett Tovey, Tea and Coffee Dealer, 29, Paddington Street, Portman Square," printed upon it, and at the back a written statement, to the effect that "Mr. Ruskin's object in setting up this shop is, that the poor round about may be able to get their tea and coffee pure and unadulterated." The adulteration question certainly presents an alarming aspect when we find that it awakens such "divine wrath" in the bosom of an ethical and aesthetical Professor as to lead him in the interests of humanity to rush into the tea trade. We have tasted Mr. Ruskin's tea and find it excellent, but for our own part we would willingly drink chopped broomsticks rather than lose the "aesthetic tea" of peculiar flavour which Mr. Ruskin has hitherto served out to us.

A LARGE collection of Etchings is now on view at the rooms of the Liverpool Art Club. It is the property of Mr. James Anderson Rose, who has issued for private circulation a catalogue of the five hundred and thirty-seven prints of which the Exhibition consists. To the Catalogue there is prefixed an Introduction, dealing generally with the subject of etching. Mr. Hamerton and other writers on the art have furnished Mr. Rose with some of the information he conveys, but Mr. Rose has expressed many opinions of his own. He says, for instance, "First among living etchers—entirely original in his work—comes James Whistler," and though we do not mean to say that any one at all acquainted with the subject would deny the many admirable qualities of Mr. Whistler's prints, yet the appreciation of his work would generally be expressed with something more of qualification. The collection is richest in modern work. Of the masters of etching of two centuries ago there are fewer examples. Of these masters Rembrandt is the best represented, as indeed he should be. Mr. Rose exhibits his *Three Trees*, which is the most powerful of his landscapes, and among a good many portraits, two or three of his finest. There is but one Claude, but that is the *Setting Sun*, which disputes with *The Cowherd* the distinction of being the most beautiful of his works. Ostade, we observe, is unrepresented. Vandyke is represented by three subjects. But when you come to the modern men, you see them in full strength. Of modern etchers the four greatest are probably Méryon, Haden, Whistler, and Legros. Jacquemart and Rajon are such perfect executants that they cannot stand very far behind, though it will hardly be natural to rank them with the masters who are original. These six men and the German Unger—besides a great number of less known names—are most richly represented in Mr. Rose's collection. Existing periodicals, such as the *Portfolio*, have made the general art public familiar with some of the work of Rajon and Jacquemart, and the separately-published portfolios of Haden, Whistler, and Legros have found a large acceptance. Mr. Haden's largest and perhaps most vigorous print, *The Agamemnon*, has been seen, as it deserves, everywhere. The general art public knows much less of the work of Méryon, though genuine amateurs have long recognised in his work the productions of an entirely original as well as a

singularly delicate genius. Mr. Rose has done good service in bringing before the visitors to the Liverpool Art Club those wonderful studies of Old Paris, on which Méryon's fame may securely rest. They combine perfect technical mastery with wide and lonely imaginative power. The stones of old Paris were alive for Méryon; no wonder that the kindred spirit of the author of *Notre Dame de Paris* has known how to value his work.

WE hear it is in contemplation to have an exhibition of Mr. Foley's sculpture, with the works of deceased painters, at Burlington House this winter.

The Vienna Kunst-Verein Exhibition was reopened on the 8th of this month. The principal attractions are Conraeder's *Death of Emperor Joseph II.*, and Wilhelm von Kaulbach's last painting, *Die Kreuzfahrer*.

ACCORDING to the *Neue Freie Presse*, Director Eitelberger, of the Museum in Vienna, has found in the Convent of St. Paul in the Lavantthal, in Carinthia, a picture, which is dated 1511, and marked with the initials H. H. It is painted on a wooden plate of forty-five centimetres in height by thirty-five in breadth, and represents the Adoration of the Shepherds. All the different parts of the picture, except the flesh parts, the sky, and a few details, are painted "en grisaille." The painting was formerly in the St. Blasien-Convent, in the Black Forest, along with most of the works of art which are now at St. Paul.

A CATALOGUE of Turner's *Liber Studiorum* has been published in America, the immediate occasion for its publication being the delivery by Mr. C. E. Norton of two lectures on Turner, and the exhibition, in connexion with the lectures, of some of Turner's work. The catalogue, printed at the Cambridge (Massachusetts) University Press, contains heliotype facsimiles of three of the etchings—that is to say, of the impressions taken off before any of the work in mezzotint engraving had been done upon the plate. The outline etchings in *Liber Studiorum* are not all alike effective, for very strong as they undoubtedly are as pure etching, it was rather upon the later work in mezzotint that Turner relied for his main effect. Three fine subjects have been chosen for illustration in this catalogue. The first, *Flint Castle* (Smugglers) is especially strong in the etching. The lines of the boat, the figures on the shore, and the vanishing curve of beach, are all the work of a supreme master; and to this subject perhaps not much effect was added by the addition of mezzotint. The other subjects are the *Little Devil's Bridge*, in the valley of the Reuss, and the *Procris and Cephalus*. The last, though magnificent in the etching, gains immensely in beauty and suggestiveness by the addition of the subsequent work. It is very difficult to get a fine impression either of etching or finished print, so that many people may well be content with this heliotype reproduction. As for the text of the new American catalogue, it must be said that the catalogue issued in 1872 by the Burlington Fine Arts Club to its members has furnished much of the material. The American compiler—a true enthusiast for Turner—acknowledges his indebtedness; but he need not have transferred what is almost the only noticeable slip in the Burlington Club Catalogue, from the Burlington Club Catalogue to his own. In enumerating the different classes into which Turner divided his work, the class "Marine" is omitted; yet it is only by the addition of this class, with its proper number of subjects, to the classes called Pastoral, Elegant Pastoral, Mountainous, Historical, and Architectural, that the right total is arrived at. In both catalogues the omission, which is that of the name only (not of the subjects) is an accidental slip. A few interesting remarks of his own Mr. Norton seems to have added, and, apart from the general introduction we find, as we go along the numbers, comments here and there on the particular subjects. The

likes and dislikes of collectors and critics for particular engravings are noticeable. Of course they must always vary, but, for our own part, we wonder why Mr. Norton appended to the mention of the *Straw Yard* the comment, "One of the least interesting and instructive of the series—a study from nature without felicity of composition." The subject, if not "composed," is exquisitely found. Mezzotint engravers have admired it very much for the effect obtained in low tone, without high lights or deep darks. A note, we perceive, is appended to the catalogue, reminding us that these prints have of late years increased in money value, and that they tend to become rarer. It is enough for the general reader to know that they are of the highest beauty, and it is to be feared that the general reader is not yet aware even of this.

MR. OSCAR BROWNING has come forward (*Fortnightly Review*, October) as the spokesman of a movement which for some years now has been silently attracting masters in our public schools. The aim of this movement is to bring about that all schools where classical literature is studied shall be furnished (1) with models, casts, photographs, or engravings of such objects as require explanation in the daily reading of Greek and Roman authors, and (2) an apparatus of casts and photographs from the existing examples of ancient sculpture and painting, such as would complement the literary remains, and combine with them in raising what is now a mere literary study into a higher and more satisfying culture. It is proposed that a society should be formed for the selection of this apparatus and for its distribution in schools. As to the first part of the programme, there can be no manner of question as to the necessity of its being carried out, and yet we are afraid that the competing forces will be found too powerful for it. With regard, however, to the second part of the programme, it would perhaps be better to give it a trial first in the universities. If successful there it could then be extended to public schools, where to meet the difficulty of attracting younger minds it would have the advantage of being introduced and made more attractive by masters who had brought from the universities a warm appreciation of the higher forms of ancient art, instead of, as it would be now, by masters who are themselves struggling against many difficulties to become acquainted with the subject.

IN the ACADEMY last year attention was called to the reproductions of ancient jewellery, by Signor Giuliano, of 115 Piccadilly, and especially to the circumstance that he had discovered the lost secret of the process by which the ancient Etruscans, and to some extent the Greeks, achieved their wonderful success in granulated gold work. No amount of modern skill of hand could cope with the difficulty that the solder by which one minute grain was attached, gave way while a second grain was being fixed close to it. It is not, however, only in the discovery of a new solder which enables almost microscopically minute work of this kind to be done, but also in the artistic excellence of his reproductions, variations, and combinations of classical designs in jewellery, that he has deserved the praise of all who are interested in the advancement of art in this form.

THE STAGE.

"OLD SAILORS" AT THE STRAND THEATRE.

THERE are eight persons in Mr. Byron's new comedy, and one of them is somewhat original—as good a proportion as you have any right to expect, when not only stage characters, but those of common life, repeat each other, at all events in the eyes of a superficial observer; and Society, like Wordsworth's cloud, "moves all together if it move at all."

Lieutenant Lamb (for we must tell the story in due form) is a naval officer, who has retired from the coast to Matlock, in order that Mr. H. P. Hall,

the excellent scene-painter, may make a picture of Dovedale or the Peak country. Lamb is a broken-down old man; brave, worthy, and hopelessly in debt. Thus it is that his niece, who is wholly dependent on him, can afford to wear a pink silk gown at a picnic, while judiciously coquetting with a money-lender, who thinks himself wronged if you suggest that he gives any "accommodation" under eighty per cent. interest. When the curtain rises old Lamb is more or less in the power of this good fellow, and, truth to say, his relatives do not promise to be any substantial help to him, for the son and niece—both of whom might retrieve the honour of the family by careful marriages with snug property—commit the extravagance of loving each other. Clara's coquetry with the bill-discounter is only to make her cousin a little jealous; it has not even enough of the laudable motive of making Mr. Ravenbill pause before he puts execution in upon the excellent lieutenant. There are two other persons of importance to the fable—not to speak of droll Mrs. Raymond, who is only of importance to the audience—and these are Millicent Tremaine, a young woman of good birth and very ample means, and Mr. Peter Pollard, a young man of low birth and very ample means. His father was a brewer; his grandfather, nobody; and of both these facts he is extremely proud. His stage originality (for here is our original character) consists in this pride, and in the sagacity with which he sticks to the substantial things of life, and is not to be tempted to risk his neck in an effort to procure for a romantic young woman a flower which grows in as "dreadful" a place as does the sapphire,

"Close to the hollow roaring of a sea."

The old lieutenant has an attached servant—one Joe Grill, who is determined to see him well, and he perceives towards the end of the first act, with infinite delight, that the romantic young heiress, weary of her brewer, turns her thoughts to the spruce Frank Lamb, who is momentarily annoyed by his cousin's coldness to him. The old servant surprises Mr. Lamb in the act of embracing the heiress, and never was embrace of better omen. "You're saved!" shouts the faithful sailor to his impoverished master; and the curtain falls on the first act.

The second act is occupied with the picnic. It is not quite clear, to begin with, whether the heiress will marry Frank Lamb, and save an excellent family, or whether she will join her estate to that of the brewer, whose attachment is genuine, though unromantic. But this problem is hardly an important one, in the view of a Strand audience accustomed to laugh, and it can wait for its solution while the Lieutenant (Mr. Edward Terry) lays the cloth for the picnic lunch; while the faithful servant produces a sea-pie of curious manufacture, and while the companion of the heiress—known to the stage as Mrs. Raymond—makes a face and says that nobody takes any notice of her—which is not strictly true, for there is no greater favourite than Mrs. Raymond at the Strand. Then there is much eating and drinking, and preparing of lobster-salad. The guests make a few good jokes, and many indifferent ones, and at last the action of the piece is resumed, and we are plunged suddenly into a situation like that which Schiller has recorded in *Der Handschuh*. The heiress is determined to test the love of the brewer—not indeed that his declarations have ever been extravagant—and seeing a flower growing in a perilous place, asks him if he will go and pluck it for her. The glove is thrown, so to say, and we wait to see whether it will be taken up. No, the circumstance would be too romantic for Mr. Peter Pollard; but the chivalrous Frank will do the lady's best. He has a bad fall in doing so, and the lady is good enough to describe, from her place on the stage, all the incidents of the accident as they occur. She does not merely scream or faint, but narrates in collected sentences everything that

happens. She posts us up in all that passes, and eventually it is with no surprise that we behold the unromantic brewer bearing in his arms the adventurous youth. The brewer, though he wouldn't run into danger to gratify a whim, has done so to save a life. Frank is swooning, and the heiress disappears while he recovers, and, to do him justice, he recovers very soon. The shock has taken marvellously little effect upon his representative, Mr. Grahame; for the young man, feeling no ill result from his fall, is at once master of his means, able to thank his benefactor, to wring his hand with force that would do credit to a gymnast, and to enter into plans for the future. "You saved my life, and I'll do anything for you," he says in effect—we can't pretend to recollect what are the precise words at this touching moment. "You don't love Millicent Tremaine, and she only admires you. You love your cousin Clara Mayfield," says the benefactor, in effect. And the ingenious youth owns that this is so. "Then leave this place," continues the benefactor. He wishes a clear field for the prosecution of his own loves. And the ingenious youth assents to the proposition, and is suddenly translated into a stage coach, which comes along conveniently. But Millicent Tremaine, returning to the scene, thinks that Mr. Pollard has not behaved very honourably in the affair, and, in the sternest accents of virtue, bids him return to his brewery.

He does return to his brewery, till the third act, when we find him in Lieutenant Lamb's parlour, relieving the misfortunes of that officer, who is still pursued by Ravenbill, the money-lender, and by a clamorous troop of unsatisfied tradespeople. Lamb imagines that his thanks are due to the heiress, who thus discovers the generosity of her discarded suitor. It turns out finally that the chivalrous Frank does not owe to good blood and birth any part of his chivalry. He is the adopted, not the actual son of the Lieutenant, but that makes no difference to the love of Clara, who enunciates, amidst applause, the undeniable proposition that "a man is what he makes himself." The romantic heiress, converted to this doctrine, takes the brewer to her heart, and the brewer ensures the future of Frank and his relations by offering him a situation of five hundred a year.

But of course the serious interest counts for very little in a play of this sort. Mr. Byron as well as another can create serious interest when he will; but here the fable is to be regarded chiefly as a tolerable excuse for the introduction of some droll figures and some funny sayings and some stage business that makes the audience laugh. A Strand audience suffers under the cruel necessity of laughing at something every couple of minutes, so that time would be perilously occupied if it were occupied with the development of a story, with the springs of action, with the portrayal of character. We feel that much more might have been made out of the sensible brewer who is proud not of a family descent, but of a family rise. He is good as far as he goes, and, though not new in life, pretty new to the stage; and we might have seen more of him with advantage. Again, Mr. Edward Terry is so good an actor that he would probably be capable of really interesting us in the misfortunes of the old naval officer. There is room here for a clever sketch of character, but the moment you begin to think him real, your attention is diverted—it is time that Mrs. Raymond made a face, or that Mr. Stephenson brought in his pie for the picnic, or that Miss Terry assumed a graceful attitude, or that somebody or other made an impossible joke. Asked, when you come away from seeing this piece, whether this piece is an artistic success, you say it hasn't much to do with Art, though Miss Swanborough and Miss Terry, Mr. Stephenson and Mr. Vernon, do play very discreetly. Asked if it answers its own purpose, and makes its audience laugh, you say, Yes—they await the burlesque in an excellent temper.

FREDERICK WEDMORE.

THE week has been productive, but not rich. Besides the Strand comedy, there have been three new pieces; and a favourite little theatre—the Court—has re-opened with an old programme.

The Geneva Cross was produced at the Adelphi on Saturday night. The story opens in the foundry of M. Pierre Lebrun. His overseer, Mathieu Moineau, an ambitious man, wishes to marry his employer's daughter Gabrielle, and to become the partner of her father in business; and Monsieur Lebrun is favourable to both these wishes. The overseer has taken a dislike to the best workman, Riel, whom Gabrielle and her foster-sister, Martago, have looked upon with approval. Martago, indeed, confesses she is in love with him, and Gabrielle is quickly becoming so. Moineau, desirous to find a pretext to get rid of Riel, who may be in his way, makes a difficulty out of a letter which has a German postmark, and which Moineau refuses to give to Riel until its contents have been inspected. The matter is referred to Gabrielle, who opens the letter, when out of it there drops a likeness of herself, which Martago, unseen, secures, while Gabrielle retains only a sheet of paper covered with German characters which she does not understand. On the poor evidence of the German note, Moineau and Lebrun agree to discharge Riel; but afterwards the master recalls him, and the overseer has to announce to him that he is retained on the works. When, in the next scene, Gabrielle's birthday is being celebrated, Riel, as the best educated and in a sense the foremost of them all, is fixed upon to put on Gabrielle's head a crown they have made of roses. Left alone, she thanks him for what he has said in the act, and they are beginning to understand each other, when a stranger steps in and Gabrielle leaves Riel to be spoken to by him. It turns out that Riel is a Prussian, and that for the good of his fatherland he has sought employment in foreign foundries. But now he refuses to leave Lebrun's or to put to any account what he has learned there. He is threatened, but keeps to his resolution, and now is rewarded by Gabrielle's avowal of love. The thing is exposed, and M. Moineau gives his consent to the match. Then war is declared between France and Germany; Paris is besieged; and all the persons of the drama suffer among its inhabitants. Gabrielle attends at the hospitals, and Riel serves under the Red Cross; but he becomes a suspected person, and he has to fly, and Moineau seizes Gabrielle as an accomplice in his escape. She and her father are condemned to death, but Moineau has influence to save them, and he will use it if Gabrielle will marry him, which she refuses to do. A body of German troops carry the fort by storm, to a proper Adelphi accompaniment of powder, fire, and smoke. Riel is at the head of the troop, and so at last all is made good for the British public, which likes the moral of *Pamela*—that virtue is sure to be rewarded. The piece is much too wordy, unless it has been cut down since the first night, but Mr. Rowe's construction is good—his story, even though sensational, holds the attention. Mr. H. Sinclair acts Riel, Mr. A. Glover is the villain Moineau, and Mr. McIntyre is the father, Lebrun. Mr. Fernandez is only a sergeant of Mobiles. Miss Marie Henderson is very unequal as the heroine. Martago is well played by Miss Edith Stuart, and Miss Hughes and Miss Hudspeth and Mr. Calhaen take part in the piece. Mr. Lloyd has painted some good scenery.

MR. MORRIS GUYVER has opened the Holborn Theatre with a piece which, if we may trust the reports of those who are generally judges, unites the attractions of the horsey drama to the attractions of historical play as it is known in the regions of the Borough. Charles II. and his favourite steed divide between them the honours of the evening, but our readers must be referred to the daily papers for an account of the story. Mr. Belford appears as the Monarch and early patron of the turf; Miss Carlotta Addison acts the heroine with simplicity; and Miss Brennan,

who can do better things, plays a jockey without being vulgar.

AN early opera bouffe by M. Hervé, newly furnished forth for the English public under the title *Melusina*, formed the entertainment offered at the Holborn Amphitheatre on Saturday. Mr. Layton is responsible for the literary part of the work, which is fairly done. As to the musical, the *Observer* notes that the music is not presented in exact conformity with the composer's intentions, and that as regards the instrumentation it is not the pure and unadulterated Hervé which one hears. Be this as it may, the piece was well received; the acting and singing of Mr. Sullivan, Mr. Riley, Mr. Betjemann, Miss Stavart, Miss Lee, Miss Armstrong, and we know not who besides, gave satisfaction; and the audience wanted to see the adapter, who gratified their wish.

THESE theatrical events of the week, which are spoken of above, are in general estimation of small importance in comparison with the production of *Hamlet*, announced for this day week. We do not know with what truth it is said that when the box-office formally opens on Monday there will hardly be a seat to be secured by the chance comer; but it is reported that applications for seats began to be made in May. There may be many questions as to the capacity of the now strengthened company for undertaking the performance, but there can be no question as to the genuine interest taken in Mr. Irving's attempt, nor as to the position which the actor holds even among people who are not often to be seen at a theatre.

It has been announced that Mr. Hare will leave the Prince of Wales's Theatre almost immediately, and that some time after Christmas the *Merchant of Venice* will be played. It is of course for this production that Mr. and Mrs. Kendal are engaged, and their engagement says much in favour of the success of the enterprise.

MR. OXENFORD and Mr. J. Hatton have worked together upon a new "extravagant comedy," which the St. James's Theatre will produce when it opens to-night, along with Lecocq's opera, *The Black Prince*, of which we spoke last Saturday.

THE extravagant but laughable American piece which was one of the last productions of last season at the Court, affords Miss Litton another opportunity—though not the best that could be seized—of displaying a more delicate art (albeit not a mature one) than is within the means of many an English actress of comedy.

THE revival of *La Princesse Georges* is the talk of the week in Paris. Of M. Dumas's later plays it is undoubtedly the most powerful and the least repulsive. It holds its ground without the assistance of Desclée, though Desclée's acting in it—more genial for once than it was wont to be—was the first cause of its fame. Now her part is played by Mdlle. Tallandiera, of whom strange stories are told. She was seized, when no longer a very young or simple girl, with a passion for the stage, and did the best thing she could do under such circumstances—asked the advice of Regnier. Regnier pronounced favourably as to her temperament. He gave her some lessons—many lessons—and sent her to Dumas. When Dumas heard her recite, he said she was as good as Rachel, and sent her on to Montigny, the manager of the Gymnase, who in a moment of enthusiasm thought her not only as good but better. It was decided that she should come before the public in *La Princesse Georges*, and on the appointed evening half the famous people in Paris were at the Gymnase to see her. They found that Mdlle. Pierson, who plays in the piece, possessed a better art, and not only a better art, but a higher intelligence. Mdlle. Tallandiera is an emotional actress who has not learned how to act comedy to satisfy critical and difficult playgoers. She has evidently dramatic power, but a

theatre for drama of broad effects, and not for delicate comedy, would be the more fitting place for its display. Mdle. Tallandiera must add another name to the weary list of actresses whose approach is heralded with trumpets and whose departure from what was to have been the scene of a triumph takes place with greater tranquillity. Mdle. Tallandiera, like most of these her comrades, took somewhat too late to the stage.

THE New Royal Danish Theatre was opened on October 15 with a festival which seems to have been a brilliant success. The entire Royal family, including the Princess of Wales, were present. The performance began by a prologue written by Ploug, and set to music by Hartmann. The first chorus was a greeting to the House, the land and people have built; the second, one of the loveliest lyrics Ploug has composed for many years, celebrated the noble function of the drama among the Greeks, and the high place it took in developing their finer qualities. We give an idea of metre and meaning in translating the opening quatrain:—

When Greece was young
The flower of scenic art out-sprung;
Red like a rose,
Still on her breast it lives and glows.

In the third chorus the poet compares the National Theatre to a high chamber built opposite the sunrise, where those who are weary of the murky air of life may climb and find themselves face to face with the poetic heavens. The fourth poem was a declamatory piece in rhymed heroics, pronounced by the greatest of living Danish romantic actors, Herr V. Wiehe, expressing thanks to the King and to the people, and then, in a very dignified style, giving a concise sketch of the rise and progress of the Danish drama. The fifth and last poem was a chorus, praying God to protect the little helpless land of Denmark, to preserve to her her arts, and send her fresh exponents of what was poetical in the national and domestic life. The Danish National Air was then sung,—“King Christian stood at the high mast,”—and the curtain rising, displayed a statue of Holberg, surrounded by a tableau of figures from the most popular of his works. The curtain rose the second time on what was the principal piece of the evening, Holberg's comedy *Det lykkelige Skibbrud*, “The Fortunate Shipwreck.” It was a matter of course that the new Danish theatre could open with the works of no other man than the classical Holberg. The evening closed with another tableau, this time consisting of figures from the works of Ohlen-schlaeger.

MADAME SOPHIE HAMET, who lately attracted much attention in Paris by her powerful rendering of the character of La Frochard in *Les Deux Orphelines*, is dangerously ill, and nearly destitute.

Rose Michel is the name of the next considerable piece to be produced at the Ambigu.

DUMAS'S *Juvenesse de Louis Quatorze* has failed at Vienna, where the critics say that it can never succeed out of the country in which some lingering admiration of Louis and of Mazarin ensures some interest in the fortunes of its heroes.

At the Theater an der Wien, in Vienna, a new rustic comedy, *Der Guissenscurm*, by Herr L. Auzengruber, has met with a most hearty reception. A high-life comedy from the same author's pen, called *Hand und Herz*, has been accepted for performance at the Burgtheater.

MUSIC.

LEEDS MUSICAL FESTIVAL.

(Concluding Report.)

Thursday, October 15.

THE first of the miscellaneous concerts, which was given last night, presented a selection of music alike calculated to gratify those who love the art

for its own sake, and the far larger number with whom the singer is a matter of much greater interest than what is sung. Mozart's “Jupiter” symphony—the last, and one of the greatest, of the forty-nine works of this class which he composed—was excellently played. The same may also be said of Weber's overture to *Euryanthe*, which concluded the first part. Unfortunately, this piece had been vulgarised by the addition to Weber's score of two cornets, an ophicleide, and a contrafagotto! It is perfectly useless to dwell on this subject here. Wherever Sir Michael Costa has the direction of the music, such vandalisms must be put up with, as well as may be, as necessary evils. I have previously had occasion to speak on this subject in these columns, and am unwilling to recur to it; but it is impossible to pass it over in silence altogether. Sir Sterndale Bennett's lovely overture to *Paradise and the Peri*, one of his best works, opened the second part; and another great treat to musicians was afforded by M. Sainton's excellent playing of Mendelssohn's Violin Concerto. M. Sainton is so genuine an artist, that it is to be regretted that he is not more frequently heard as a soloist. The choir sang Dr. Spark's new chorus entitled “Martial Music,” and two elegant part-songs by Mr. Henry Smart. Dr. Spark's chorus, though not particularly “martial,” is effective. Towards the close the choral “Ein feste Burg” is introduced. The composition, which is somewhat long, and in parts by no means easy, was admirably sung by the excellent choir; though it was not possible for them to sustain the pitch without accompaniment throughout so amply developed a work. The vocal music was contributed by Mdles. Titiens and Singelli, Mdme. Otto Alvsleben, Mdme. Patey, Mr. E. Lloyd (*vice* Mr. Sims Reeves, who was unwell), Mr. Bentham and Signor Agnesi. There is only space here to mention particularly Mdle. Titiens' grand reading of the scene from *Oberon*, “Ocean, thou mighty monster,” and Mdme. Alvsleben's brilliant vocalisation in an air from Graun's *Britannico*, a composition so uninteresting and feeble as to be altogether unworthy of the trouble the lady took with it.

This morning's concert opened with Handel's First Organ Concerto—the solo part being played by Dr. Spark, the organist of the Town Hall. This particular species of composition was first introduced by Handel at the performances of his oratorios, to give relief to the large number of vocal pieces. During the later years of his life it was his invariable custom to perform a concerto—usually between the parts, but occasionally in the middle of an act. M. Schoeleher, in his *Life of Handel*, says that in several of his conducting scores may be found in pencil the words, “Segue il concerto per l'organo”—here follows the organ-concerto. Above twenty of these works exist; but Handel not infrequently, especially after he became blind, extemporised—the orchestral parts only being written out, with pauses for the organ improvisations. The concertos in hardly any respect resemble our modern works which bear the same name; and the solo parts are written rather for the small instruments of Handel's days than for the leviathans to be found in our present concert rooms. The instrument in the Leeds Town Hall is built by Messrs. Gray and Davison, and is not only the largest, but as regards quality one of the finest specimens of their workmanship. It cannot be honestly said that Dr. Spark, who appeared to be suffering from nervousness, did anything like justice to his music; but he certainly showed off to advantage the varieties of tone in the giant instrument at which he presided.

To the concerto succeeded a very fine performance of Mendelssohn's *Lobgesang*. This work, which was written to celebrate the 400th anniversary of the invention of printing by Gutenberg, was first performed at the Thomaskirche (the church in which Sebastian Bach was organist), at Leipzig, on June 25, 1840. It was then produced

at Birmingham, on September 23 of the same year, and repeated in Leipzig in the following month. But Mendelssohn, with that fastidious self-criticism so characteristic of him, to which the beautiful artistic finish of all his works is so largely attributable, had by this time perceived that the work was capable of considerable improvement. After the third performance he therefore remodelled the whole cantata, introducing three new numbers. Chief among these is that wonderful tenor solo, “We called through the darkness, Watchman, will the night soon pass?” and the following soprano solo, which leads with such overpowering effect to the climax of the whole work, the chorus “The night is departing.” The other additions were the lovely duet “My song shall be always thy mercy,” which forms so delightful a relief to the excitement of the chorus just named, and the tenor solo “He counteth all your sorrows.”

With regard to the performance this morning, I am almost afraid to say what I feel, lest I should lay myself open to the charge of flying into raptures on the smallest provocation. This, however, I must risk, and say decidedly that never have I been so overpowered by any performance of this work as I was to-day. I have no hesitation in saying that of the volume, richness and purity of tone, of the mingled delicacy and force of this Leeds chorus, none except those who were present can have any idea. In this work it was simply perfection itself. Nor were the solo parts unworthy of the choruses. Mdmes. Otto-Alvsleben and Trebelli-Bettini were excellent, and Mr. Lloyd (especially in the trying solo “The sorrows of death”) was even more than excellent. My readers must excuse my enthusiasm; had they been present, they would, like all the audience without exception, have been as enthusiastic as myself. The morning's concert concluded with a long selection from *Israel in Egypt*. In this the chorus, especially in that wonderful movement “He sent a thick darkness,” were less perfect than in the *Lobgesang*, but the performance as a whole was highly creditable. The solos were sung by Mdme. Patey, Mr. Lloyd, Mr. Santley, and Signor Agnesi.

Friday, October 16.

Last night's miscellaneous concert opened with a very fine performance of Beethoven's “Pastoral” Symphony, to which succeeded Mr. Henry Smart's cantata, *The Bride of Dunkerron*. This work was composed for the Birmingham Festival of 1864, and was first produced there on September 6 in that year. It has since been occasionally performed elsewhere—among other places, at the Crystal Palace. Without displaying any decided individuality of style, it is throughout most effective and pleasing music, admirably written both for voices and instruments. Traces of the influence of Spohr and Mendelssohn, especially the latter, are clearly discernible in the work—rather, for the most part, as suggestions than as actual reminiscences. The opening chorus, “Ere the wine cup is dry,” is happily conceived and full of charm; among the best numbers of the work may also be named the tenor song, “The full moon is beaming,” the bass solo “The sea rules all” (the very difficult trumpet part in which was played to perfection by Mr. T. Harper); the graceful chorus of sea-maidens, “Hail to thee, child of earth,” which was encored; and the finale, “The dark storm is past.” Less successful are the duet and chorus, “Hark! those spirit voices,” the quick movement of which much resembles Balfe, and the chorus of storm-spirits, “Down through the deep,” which, though very telling and effective, is too reminiscent of Mendelssohn's *Walpurgis Night* and *Loreley*. As a whole, however, the work is one which does much credit to the composer, and is a worthy specimen of English music. The performance last night was good, but not first-rate. The solo parts were well sung by Mdme. Otto-Alvsleben and Messrs. Lloyd and Santley. Both in chorus and orchestra, however, some unsteady-

ness was at times apparent. At the close of the work the composer, who was present, was called forward and enthusiastically applauded. A miscellaneous selection followed, which there is no room here to particularise, in which Mdle. Singelli, Mmes. Patey and Trebelli-Bettini, and Messrs. Santley and Giulio Perkins took part. The specialty of this portion of the concert was the magnificent singing of the choir in the march and choruses from *Tannhäuser*.

This morning's programme has included Macfarren's oratorio *St. John the Baptist*, and Rossini's *Stabat Mater*. The former work was noticed in detail on the occasion of its production last season by the Sacred Harmonic Society (see ACADEMY for March 28), and a few words will therefore suffice now. A second hearing of the work confirms the favourable impressions previously formed; indeed, like all thoroughly good music, it improves on acquaintance. The performance to-day was, excepting one unlucky slip at the close, absolutely perfect. The chorus singing, especially in the very difficult numbers for male voices in the second part, was truly marvellous, and fully justified all that has been said earlier in this letter in praise of the choir. Madame Otto-Alvsleben gave a most brilliant rendering of the florid music allotted to Salome, which exactly suits both her voice and her style. Mdme. Patey and Messrs. Lloyd and Santley were the other soloists, and, it is needless to say, left nothing to desire. Respecting a work so well known as the *Stabat Mater*, it is unnecessary to do more than record a very excellent performance, and to say that the solos were given by Mdle. Titiens, Mdme. Trebelli-Bettini, and Signori Campanini and Agnesi.

This evening's concert has been to many of the musicians present the most interesting of the entire festival, for it has brought to a hearing one of the finest and most individual of Schumann's compositions—his great cantata *Paradise and the Peri*. It speaks not a little for the Yorkshire audience that an elaborate, and in places somewhat abstruse work—which was probably not known, except by name, to one in fifty of those present—should have attracted by far the largest audience of any of the concerts yet given. So great, indeed, was the crowd, that it was found necessary to throw open the large doors at the back of the hall, and to place rows of seats in the entrance-lobby. Schumann's work was composed in 1843, and first given at Leipzig on December 2 of that year. It was first performed in this country, by command of Her Majesty and the late Prince Consort, at the Philharmonic Concerts on June 23, 1856. On that occasion the principal soprano part was sung by Mdme. Goldschmidt (Jenny Lind). It has since been twice given at the Crystal Palace, and occasionally in the provinces; but has never attained any large amount of popularity in this country. As the work is nevertheless one of the most precious legacies which Schumann has left to musicians, it may be worth while to endeavour to account for the comparative coldness of its reception here.

The subject of the work, as will be inferred from the title, is taken from Moore's *Lalla Rookh*. The poem had been translated into German by Schumann's young friend Emil Flechsig, who was desirous that the composer should set it to music. On reading it through, the latter perceived that certain alterations were needed to adapt it to its new purpose, and undertook to make the necessary changes himself. Unfortunately these were not always judicious. Schumann destroyed the artistic unity of the work by introducing a narrator, and thus causing a mixture in the libretto of the lyric and dramatic styles. Besides this, the action in the third part hangs fire, and the music is over-elaborated, and in the greater portion much less interesting than in the first or second part. In many of his longer works, Schumann shows a similar falling off towards the close. One of the most striking instances of this is

found at the end of his lovely cantata *Der Rose Pilgerfahrt*. Another weak point in the work is the injudicious—I had almost said inartistic—treatment of the voices; the tenor solos especially are so laid out that it is all but a physical impossibility to sing them as they are written. At times lying quite in the upper part of the register, they at others descend so low that only a baritone singer could give them with effect; and Mr. Lloyd, who sang them to-night, was fully justified in transposing many passages an octave higher. Moreover, nearly all the solo parts of the work are too thickly instrumented; the accompaniments cover up and obscure, rather than overpower the voice; and there are many movements, consequently, which are more enjoyable in reading from the score than in actual hearing. One more point may be mentioned, by no means as a fault, but as helping to explain the comparative unpopularity of the work—that Schumann's music is of that intellectual nature which appeals rather to the cultivated musician than to the average concert-goer.

Yet, with all its defects and shortcomings, *Paradise and the Peri* is, and must ever remain, a glorious monument of its composer's genius. Nothing more poetic exists in music than the beautiful orchestral prelude to the work; nothing more deeply touching and pathetic than the whole scene of the pestilence in the second part. The song of the young maiden, "O let me only breathe the air," is wonderful in its passionate tenderness; and the solo and chorus, "Sleep on, in visions of odour Orest," with which the second part concludes, has an ethereal beauty which is simply indescribable. Had Schumann written nothing but these two movements, they alone would have secured him a place in the first rank of composers. Most charming, again, in an entirely different style is the melodious chorus of hoursis, "Wreath ye the steps to great Allah's throne," and the lovely quartets, "O beauteous land" and "For there's a magic in each tear." The gorgeous oriental colouring spread over the whole work and (excepting in portions of the third part, where the wings of the composer's imagination droop) the constant flow of delightful melody are also prominent characteristics of the music.

The performance to-night was a musical treat of the highest order. It may safely be pronounced the finest yet given in this country. The whole of the important and very difficult music of the *Peri* was sung by Mdle. Titiens. When it is said that she was in splendid voice, and sang in her grandest style, it is needless to add another word. Mdme. Alvsleben sang the remaining soprano solos; her performance of the song, "O let me only breathe the air," above mentioned, being characterised by genuine artistic feeling. Mdme. Trebelli-Bettini and Mr. Lloyd were no less admirable in their respective parts; but Signor Agnesi, excellent as he is in florid Italian music, seemed "like a fish out of water" with Schumann, and failed to produce any effect. Sir Michael Costa's *tempi* were most judicious; but, alas! for the alterations he made in the music. In the words of Moore, "the trail of the serpent was over them all." To speak adequately of the chorus, I could only repeat what I have already said about them—they were magnificent; while the difficult and, to most of the band, unfamiliar instrumental parts were played by the orchestra with a finish and refinement which cannot be too warmly praised. The reception of the work by the audience was, in the words of a musician present, respectful rather than enthusiastic; much of the music was evidently not fully understood at a first hearing. It could hardly have been otherwise.

Of the miscellaneous selection which followed there is only room here to say that Mdle. Titiens, Mmes. Alvsleben, Trebelli-Bettini, and Patey, and Signori Campanini and Agnesi took part in it; and that an immense success was achieved by

Gounod's "Funeral March of a Marionette," which (though it suffered from being taken too fast) was so rapturously received that, in spite of the conductor's evident unwillingness, he had no alternative but to repeat it.

Saturday, October 17.

The length to which this report has already extended precludes more than a word or two to say that a remarkably fine performance of the *Messiah*, in which Mdle. Titiens, Mdme. Alvsleben, Mdme. Patey, Messrs. Lloyd, Bentham, and Santley, and Signor Agnesi took part, has just brought the festival to a brilliant conclusion. This evening a "People's Festival Concert," at popular prices, will be given in the Town Hall, in order to give those who have been unable to attend the Festival an opportunity of hearing some of the principal vocalists.

The people of Leeds may be warmly congratulated on the very complete success which has crowned their first festival. May that of 1877 be worthy of the one just held! It should be added that the whole arrangements have been admirably carried out by the honorary secretaries (Messrs. G. H. Nelson, E. Wilson, and C. E. Wurtzburg), assisted by the committee and the stewards; while the credit of the success from a musical point of view is equally due to Sir Michael Costa as conductor, and Mr. Broughton as chorus-master.

Ebenezer Prout.

THE second of the Crystal Palace Concerts took place last Saturday. As our reporter, being at the Leeds Festival, was unable to be present, we can only record the fact that the programme included Mendelssohn's "Italian" symphony, the overture to *Oberon*, and Mr. Henry Gadsby's overture, entitled *The Witches' Frolic*. Dr. Hans von Bülow made his first appearance this season in Liszt's "Fantaisie Hongroise," and solos by Chopin; and Mdme. Sinico and Miss Antoinette Sterling were the vocalists.

THE detailed prospectus of Messrs. Novello, Ewer & Co.'s grand scheme of concerts at the Albert Hall is now issued. Commencing on the 7th proximo, a performance is to be given on every evening in the week. Monday will be a ballad night; on Tuesday the first part of each programme will consist of music by English composers; Wednesday will be devoted to classical, vocal, and orchestral works; every Thursday there will be an oratorio; modern orchestral music, with especial attention to the works of Wagner, will occupy Friday; and Saturday will be a "popular night." The English music will be conducted by Mr. J. F. Barnett, and the Friday's performance by Mr. Dannreuther; on the remaining evenings Mr. Joseph Barnby will be the conductor. An orchestra of seventy performers, including many of our finest players, has been engaged; and the chorus will consist of the members of the Royal Albert Hall Choral Society. The list of vocal and instrumental soloists announced comprises a large number of the most eminent living performers. The preparation of the analytical programme has been entrusted to the competent hands of Mr. Joseph Bennett. How far a concert at the Albert Hall on every night in the week is likely to prove pecuniarily successful is a question which actual trial alone can decide; but the enterprise of Messrs. Novello, Ewer, & Co. is so comprehensive and excellent, that if it does not command success, it will at least deserve it.

THE *Neue Zeitschrift für Musik* announces that *Lohengrin* is to be produced next March, for the first time, at the Italian Opera in Paris, and that the part of Elsa will be sung by Mdme. Blume Santes.

THE musical society "Euterpe" at Leipzig celebrated its jubilee at the first concert of the present season, which took place on the 20th inst.

THE *Signale* states that a report is circulating in well-informed circles in Vienna, that negotiations are on foot to secure the services of Dr. Hans von Bülow for the Hofopertheater at Vienna. In what capacity it is proposed to engage the great artist is not yet known, and conjectures of all kinds are afloat. The most probable is that he is to be offered a post as musical director, or general adviser. Even if the report of the invitation be correct, it is doubtful whether Bülow will be inclined to accept it, and to take a not altogether independent position at the Viennese opera. In any case, the report excites considerable attention in musical circles.

MME. ROSA CILLAGH, the Viennese *prima donna*, who will be remembered by many of our opera frequenters as having visited London some years since, has opened a singing-school in Vienna.

In Paris the pianoforte manufactory of Herz was set on fire on October 10, and the workshops completely burnt down. The fire was the work of an incendiary—a discharged workman of the firm, named Gauthier, who kindled it in revenge. Being caught in the neighbourhood of the building, it was with difficulty that the police could save him from the infuriated mob, who wished to hang him to the nearest lamp-post.

THE new organisation of the Hoftheater at Vienna, so far as at present known, includes two new and important reforms. It secures the independence and authority of the director towards the members of his company, by providing that henceforth there shall not be, as hitherto, any appeal from him to a higher authority, whereas heretofore the members of the theatre were never tired of bringing their grievances before the intendant. The engagements of the artists will also, for the future, be left entirely to the discretion of the director, the intendant merely having a deciding vote in financial questions.

It is announced that Richard Wagner, assisted by Franz Liszt, will in the course of the winter give grand concerts in Vienna and Pesth for the benefit of the Bayreuth undertaking. At these concerts it is said that selections from the *Götterdämmerung*—the concluding part of the "Nibelungen" trilogy—will be performed for the first time. We give this intelligence on the authority of the *Signale*, but must add that we regard it with some little suspicion, as it is well known that Wagner has hitherto resolutely set his face against the concert performance of any portions of his great work, saying that they must only be heard on the stage, and in their entirety. We shall await with interest the confirmation or contradiction of the report.

MR. SIGMUND MENKES is preparing for publication a biography of Mdle. Marie Krebe, which is, we understand, to appear first in the columns of our contemporary the *Musical World*, and afterwards in a separate form.

It is announced that the Dean and Chapter of Worcester have formally refused, in reply to a request from the Mayor as chairman of the Festival Committee, to give up the use of the cathedral for the next year's Festival of the Three Choirs, which would, in regular rotation, have been held in that city. By this course, which was not altogether unexpected, the very existence of the meetings is threatened. It remains to be seen what course will be adopted by those who are anxious for their maintenance.

THE death at Paris, on the 7th of October, of the distinguished Norwegian pianist, Thomas Ackland Tellefsen, is announced. Tellefsen was born at Throndhjem, where his father was organist of the Cathedral, on November 26, 1823, and was named after Sir Thomas Ackland, who had made his father's acquaintance while travelling in Norway. In his early childhood he was bewitched with the concertos of

Chopin, and grew up with the fixed intent of attaching himself sooner or later to that great master. In 1842 he managed to procure a passage over to Havre, and found his way to Paris. Still there was a great gulf fixed between the unknown Norse youth, and the fashionable composer. Tellefsen was fortunate enough to be noticed by George Sand, who was delighted by his power and enthusiasm, and introduced him to Chopin. From this moment he became the composer's best and most faithful pupil, never leaving him for a moment during his final illness. Besides being a brilliant virtuoso, Tellefsen was a careful though not abundant composer, a man of wide intellectual sympathies, and a friend of some of the greatest Frenchmen of his time.

THE well-known pianist and composer, Herr Ignatz Brüll, has finished a three-act opera-comic, named *Das goldene Kreuz* ("The Golden Cross"). The libretto is by Mosenthal, the author of *Deborah*.

SHAKESPEARE'S *Much Ado About Nothing* has again been set to music by a German, Herr Hans Gotz, of Zurich. The work, a comic opera in four acts, was successfully produced at Mannheim last week.

HERR KINDERMANN, the baritone of the Munich Opera, is starring at the Vienna Komische Oper. His first appearance was in Lortzing's *Waffenschmied*, and he was three times encoined in the well-known aria "Auch ich war ein Jungling mit lockigem Haar."

HERR REINECKE, the Kapellmeister of the Gewandhaus Concerte, in Leipzig, is, as Viennese papers say, intended to be the successor of Otto Dessoff (who is going to Karlsruhe), as first conductor of the Vienna Opera and the Philharmonic Concerts.

MME. DOMINIQUE, the teacher of dancing in Paris, has at present in her academy a future Taglioni, who has been engaged for three years by Halanzier for the new opera. The director appears to be so charmed with his young recruit that he allows her annually a three months' leave of absence, but imposes at the same time a forfeit of 50,000 francs. This Taglioni of the future is called Audie Colombier, and is a sister of Marie Colombier. She is only fifteen, but is very gifted, and has a musical turn, besides being an adept at drawing and sculpture.

Polybiblion states that M. Edouard Fétis has handed over to Messrs. Firmin Didot the MS. of the fifth volume of the *General History of Music*, completed with the help of the documents left by his father. The fourth volume of this important work is now in the press.

POSTSCRIPT.

WE are informed that the complete Biography of the late Prince Consort, on which Mr. Theodore Martin has been for some time engaged, is nearly ready, and that the first volume may be looked for in December. It is now six years since the *Early Years of the Prince Consort* appeared.

THE great Italian tragedian, Ernest Rossi, has been exciting great enthusiasm in Florence by his rendering of the part of King Lear. But his countrymen are likely to lose him just when he has arrived at the full maturity of his powers. The Brazilians are urging him warmly to return to them, Warsaw calls upon him to found a school of dramatic art in its centre, and Russia and Germany are putting in rival claims to his services. The *Rivista Europea* is naturally anxious that he should have some inducement to consider himself as *de facto* belonging to his own country, and suggests that the municipality of Rome should get together a permanent dramatic company and provide handsomely for its maintenance.

THE *East Anglian Daily Times* of Saturday announces the discovery by Mr. J. E. Taylor, F.G.S., of a buried forest in the Orwell. The forest is represented by a layer of peat, containing trunks, leaves, and fruits of the oak, elm, hazel, and fir; associated with which are the remains of the mammoth. A bed of fresh-water shells, containing species not now living in the Orwell, underlies the peat. Mr. Taylor regards this submarine forest as contemporaneous with others along the coast which existed previous to the depression separating England from the Continent.

WE are informed by the Rev. A. H. Sayce and Mr. P. Le Page Renouf that we fell into an inaccuracy in stating, in our last number (page 429), that they had in preparation "new Grammars" of the Assyrian and Egyptian languages respectively. The books on which Messrs. Sayce and Renouf are engaged are merely a short praxis for the use of students attending their lectures on the Egyptian and Assyrian languages and literature, and are intended specially for beginners.

THE heirs of Count Vettor Pisani-Zusto have liberally given two of the most valuable pieces of his fine collection to the city of Venice—the Daedalus and Icarus, one of Canova's first groups, and the agate toilet service which formerly belonged to Caterina Cornaro, Queen of Cyprus. The first is to be placed in the Royal Academy, the second in the Museum.

THE inauguration of the Archaeological Institute of Liège, and the installation in the palace of the Prince-Bishops of the rich and interesting collections belonging to the Institute, took place on the 12th inst., in presence of M. Delcour, the Belgian Minister of the Interior.

MR. NEUBATER points out, in the *Times* for Oct. 17, that the phrase "limit of Gezer," in the inscription discovered by M. Ganneau (see *ACADEMY*, Oct. 17, p. 431), most probably has reference to the Rabbinical law of the Sabbath. The fact that the letters were placed in such a way as to strike the eye of one coming into the town from the country may be explained from the existence of distant suburbs, whose inhabitants were allowed to go as far as the "limit," but not beyond.

No. 130, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Cretan Insurrection of 1866-7-8. By W. J. Stillman, late U.S. Consul in Crete. (New York: Holt & Co., 1874.)

MR. STILLMAN is already known to readers on both sides of the Atlantic, and will no doubt establish by the present volume all the higher claim to respect and consideration. He is one of those multifarious Americans to whom nothing seems to come much amiss. Landscape painter, author, photographer, mountaineer, revolutionary adventurer (in the Hungarian insurrection of 1848-9), diplomatist—the friend of Emerson, of Lowell, of Agassiz—he has borne a part in many schemes of life and of work. As regards the Cretan insurrection in especial, he is amply entitled to use the phrase which appears in his preface, *quorum pars magna fui*. We accept as strictly correct the account which he here gives us of the attitude that he assumed in these events, and we believe, therefore, that he did not take any active share in fomenting or directing the Cretan rising; indeed, his position as Consul of a friendly Power accredited to the Turkish Government would not have allowed him to do so. But it is manifest that from the first he used his consular position very determinedly in the interest of the islanders, supporting every fair demand which they preferred through their representatives, and urging that reasonable concessions should be made while it was yet time; and at a later date, when governmental oppression had entailed resistance, and resistance had been repelled with obduracy, and combated with furious brutality, he worked with all manly and sympathetic energy with a view to European intervention, and a definitive because a just settlement of the formidable questions at issue. Before the dire struggle had closed in blood, devastation, and burning memories (destined in all likelihood to smoulder awhile, and to flame out again once more), he had come to be looked up to by the Cretans and their Hellenic allies as a prime personage in the contest, and by the Turks as a dangerous “irreconcilable,” too honest and clear-sighted to be cajoled, too important to be ignored, and sufficiently capable to be turned to account—were this but manageable—in the interests of the State.

In any case of this kind it is undoubtedly possible to take either side, without thereby proclaiming oneself fatuous or black-hearted. Some persons will hold that the Turkish cause was the better of the two, because it had the reins of authority and the material power, and its ultimate aim was “to keep

things quiet.” Others adhere to the Cretan cause, because the islanders were the sufferers under oppression, their nationality and traditions the nobler of the two, their objects the finer in their remote issues, and their uprising an act of valiant self-devotion. We profess to be unreservedly on this side, and only sorry that the Cretans did not secure as well as deserve success; and therefore, while we admit that the contrary opinion may be tenable enough for those who cherish it, we shall frankly proceed on the tacit assumption that it is wrong.

Mr. Stillman reached Crete as United States Consul in the autumn of 1865: possibly, had his Government had the least anticipation of the exciting and embarrassing events of which Crete was immediately to become the theatre, a more pliable and less animated official would have been selected for the post. The Consul lost no time in running a tilt with Ismail Pasha, the governor of the island: “a patrol of zapties (Albanian police) having entered the Consulate to seize and carry off one of the sons of the Vice-Consul, who resided in the Consulate,” an apology was demanded on the part of the American Government, and a good deal of rather irritating finessing ensued on both sides. On April 12, 1866, the assembly of Cretans began at Omalo, and afterwards moved to Boutzounaria (near Canea, one of the two capitals of the island), numbering some 3,000 men. They drew up a petition to the Sultan, asking for the redress of various grievances: and very real grievances they were—and, no doubt, mostly still are—such as enormous taxes on food, tobacco, land-rents, &c.; the absence of roads and bridges; gross maladministration of justice; arbitrary imprisonments; deficiency of schools; religious coercion, &c., &c. This petition received after a while an answer proffering no satisfaction, and couched in terms of unmistakable menace. The committee who had presented the petition for Ismail to forward were summoned by the latter to disperse; but neither the committee nor the assembly itself showed any disposition to obey this order, having an old firman on their side, as well as immemorial custom, and knowing the man with whom they had to deal. The Consular body was consulted; and, with the exception of the French and English officials, they countenanced the proceedings of the Cretans, Mr. Stillman himself being a principal spokesman. Nevertheless, all the consuls urged the committee to disperse, though most of them opposed any violent process of dispersal. This advice was overruled, partly by the influence of Dr. Joannides, a Greek physician, then resident in Crete. The committee withdrew to the mountains, and the chance of a peaceful termination dwindled considerably, especially when Ismail “called in the entire Mussulman population of the island to the walled cities.” This measure, if intended by Ismail as it turned out, was a sufficiently diabolical one. The Mussulmans, enraged at being dragged away from their work and domestic interests, boiled with fanatical spite against the Christians, and a horrid collision might be clearly foreseen. The first blood drawn, however, was Christian by Christian; an insult on political grounds revenged by one

of the turbulent and unsubdued Sphakiote race. The first Mohammedan slain was a wretch, notorious in the war of 1821-30, who boasted in a café of having murdered a Christian family of eleven persons.

We have now got over the preliminary stages of the Cretan insurrection, and are coming to the far more important and moving period of armed resistance and military repression; but these we cannot here follow in detail. Mustapha Kiritli, the “Butcher” Mustapha, abhorred yet in some sort respected, was appointed Governor or Commissioner. A Mussulman sortie from Selinos was repulsed by the Christians, and the revolt against authority had become an insurrection in force. The Committee summoned the Egyptian troops under Schahin Pasha to leave the Apokorona, and the Egyptians had to surrender and march out. Ismail Pasha was ordered by his own Government to retire from the island. Auxiliary committees were formed in Greece. Arms for the insurgents were landed in the *Panhellenion*. Zimbrakaki, the captain of the Greek volunteers, showed (at least in Mr. Stillman’s estimation) far less character and ability than another of their commanders, Colonel Coroneos. The siege of the monastery-fortress of Arkadi by the Turks, and its being blown up by one of its patriot defenders, a priest, is, of all the incidents of the insurrection, the one which excited the most attention and interest at the time in Western Europe, and which remains now most clearly defined in the memory. It was only after this terrible incident that our author began to have some hope for the future of the insurrection, and he did his best to bring on a European intervention. Mr. Morris, the American minister at Constantinople, seconded him; and Mr. Seward, the foreign minister of the United States, wrote Mr. Stillman a letter of approval, which is here reproduced. Mustapha, like his predecessor Ismail, was recalled. Hussein Avni, who succeeded him, regarded Mr. Stillman as the ringleader. Still, after all sorts of atrocities had been committed by the Turks, and not a few by the insurgents, nothing conclusive was achieved, and more vigorous measures, under the conduct of a more illustrious general, had to be adopted by the Sultan. On April 9, 1867, Omar Pasha, of Crimean fame, arrived in Crete. The American Consul was greatly disappointed in him: he thought him weak and conceited, and, in his military operations and personal immoralities, systematically cruel and brutal. The Cretans formed a provisional government under Mavrocordato, acting in the name of the Hellenic State; their nominee, however, never came forward to serve. Omar’s soldiery produced no striking results: he was perpetually thwarted, and after great fatigues and strenuous endeavours, found himself still hardly beyond the beginning of his task. At one time, in Mr. Stillman’s opinion, Coroneos, had he been properly seconded by Petropoulaki and other chiefs of the Cretans, very generally jealous and unruly, might have given the finishing stroke to Omar and his army. These troops, beginning with a strength of 45,000 men, left off in October 1867, hardly

numbering 20,000. The largest insurgent force ever collected was about 5,000 men. Early in the same month the Grand Vizier A'ali Pasha arrived: "except in Sitia, the extreme eastern peninsula, there was hardly a house with its roof on" throughout the island. Mr. Stillman found much to admire in A'ali Pasha, and to approve in his schemes of pacification. Russian influence, however, was exerted to prevent the acceptance of these by the Cretans, and a change in the Greek ministry, bringing Bulgaris into power towards the same time, produced a very detrimental, and at last a finally crushing effect on the insurrection. Omar Pasha quitted Crete on November 11, leaving to his successor Hussein Avni, if not an actual military advantage, at least a very serviceable plan of operations—that of the construction of block-houses, which extremely trammelled the movements of the Cretans. The chief command of the patriots was offered to Coroneos; but his plan of action was rejected by the Greek Government, which perfidiously favoured the pretensions of Petropoulaki in his stead. The expeditionary force finally sent over from Greece made a mere feint, and gave in; and a subsequent complication between the Turkish and Grecian powers, the result (as Mr. Stillman thinks) of a planned intrigue of the Bulgaris Government, prompted by Russia, came to divert public attention from Crete to the Hellenic mainland. "Further supplies to the insurrection were cut off, and it collapsed almost without notice."

Such is a very scanty outline of the account which Mr. Stillman gives us of the Cretan Insurrection. The reader may fill in for himself the details of marching and countermarching; troops attacked in mountain passes, now fighting their way through, now having nothing for it but to retreat with loss, and then to return with fury, or else submit to be worsted: valour and enterprise on the part of the Cretans, hampered by personal jealousies and want of combination; and, saddest of all to read of, the utter misery of the population, the destitution of women and children, only remedied by a systematic exodus to the Grecian mainland, and continually repeated atrocities, all the more horrid as the struggle thickened and intensified. Here is an incident from a very early stage of it:—

"Some of the besieged [Mohammedan] Cretans, recognising a brother of a prisoner in their possession amongst the [Christian] besiegers, killed the prisoner; and, cutting him up as the butchers cut meat, hung the members above the parapet, calling to the besiegers that they had meat yet. The besiegers retaliated by treating half-a-dozen prisoners in the same way, and calling to the besieged [not 'besiegers,' as in the text], that, if they wanted more, they might come and get it."

A few further particulars as to Mr. Stillman's personal position during these events may be added. During the rule of Mustapha Pasha he was made so uncomfortable in Crete that he passed the summer on ship-board, coasting about in the Grecian Archipelago. In September 1868, he entirely quitted Crete under medical order, and went to Greece. In April 1869, his wife, broken down by all sorts of public and private hardships, "became insane and ended her life." Much

about the same time Mr. Hamilton Fish, the new American Secretary of State, removed Mr. Stillman from the Consulate at the request of the Turkish Government. In June of the same year the ex-Consul returned from Greece to Crete, to make his final arrangements. Afterwards, at the request of Mehmet Pasha, now commanding in the island, he went to Constantinople to represent the case of the Cretan chiefs then remaining in exile; and A'ali Pasha, with whom he discussed the matter in Constantinople, even

"proposed to me" [says our author] "to go to Crete to superintend the carrying out of the measures which seemed necessary to restore the confidence of the late insurgents, pledging himself to accord complete immunity to any individuals whom I should designate as possessing my confidence, and offering me a stipend more than sufficient for all my needs in the service."

But the Grand Vizier could not indemnify the persons implicated against "civil suits on account of acts of war;" and Mr. Stillman, seeing that his proposed mission could only end in misunderstanding and disappointment, felt constrained to decline.

The outspokenness of the ex-Consul about various officials is, if not excessive, at least extreme. The American minister in Greece was "the most incapable, ignorant, and obsequious diplomat I have ever known in the service of our Government, a man who was an actual cipher in any political sense." Ismail Pasha was "a clever cunning Greek renegade, charlatan in everything but intrigue, of the worst possible faith and honesty, avaricious, mendacious, and cruel, but plausible and persuasive." M. Derché, the French Consul (afterwards succeeded by M. Tricou) was

"a Levantine of the lowest order, a bastard of one of the De Lesseps family by a Jewish adventuress, and an intense hater of the Greeks ever since the society of Syria, where he was once Chevalier de Consulat, refused to recognise his mistress, a retired saltimbanque from a café chantant of the Champs Elysées."

The association between the English Consul Dickson and this personage "was like coupling a faithful mastiff to a dirty bazaar-dog." Some other portraits, sketched in similar tints, might be referred to. As a set-off we have cordial praise of Captain Bontakoff, of the Russian frigate *Grand Admiral*; of Hadji Mikhal, one of the Cretan chiefs; of Server Effendi, the Turkish diplomatist; nor of these alone. One of the author's leading objects is to exhibit the influence which subordinate officials and personal interests have in Oriental affairs.

As regards steady adherence to his subject-matter, and historical conciseness, Mr. Stillman's moderate-sized volume (scarcely 200 pages) might serve as a model to the recorders of those episodes of history which are at once important and subsidiary; deserving of careful observation, but aside from the main stream of events. The last section, named "The Year after the War," has a lighter and more sketchily descriptive character. A map would be an absolute essential to a full understanding of the narrative; but none is here vouchsafed.

W. M. ROSSETTI.

Les Chants Populaires Bulgares. Rapports sur une Mission Littéraire en Macédoine. Par M. Auguste Dozon. (Paris: Impri-merie Nationale, 1874.)

It might be supposed that the humour of palming off imitations of popular songs as genuine was by this time nearly exhausted, and that experts in ballad-lore could no longer be imposed upon. When Scott was collecting the Border Minstrelsy, he allowed Surtees to deceive him with ballads which no one would now take for genuine popular lyrics. Still, it is best to be cautious, especially with ballads that come from a district so little known as Mount Rhodope. M. Emile Burnouf, therefore, did very wisely in sending M. Dozon to inspect the MS. collection of M. Verkovich. In the volume before us, M. Dozon gives an account of his mission, which has several amusing and instructive features. M. Verkovich is a Bosnian Serbian, residing at Serrès. He is an enthusiastic Philo-Bulgarian, and for many years he has held, and done his best to promulgate, the following opinions, which have all the charm of absolute novelty.

1. The ancient Illyro-Thracians were members of the Sclavonic race.

2. They have kept their blood pure since the most remote antiquity, and the name Bulgarian is the only modern thing about them. Consequently Orpheus, and Alexander the Great, were Bulgarians.

3. The Slavo-Bulgarians are the only authors of the civilisation falsely attributed to the Greeks.

4. The Greeks are not Aryans at all.

Now these are views that clearly need some proof beyond their mere intrinsic probability. M. Verkovich expected to find proofs in the history contained in the traditional songs of Bulgaria. He set about collecting songs from the local minstrels, and on "the happiest and most solemn day of his life" he recovered a ballad concerned with Philip of Macedon. This was not all: ballads about Orfèn, Frèn, Ufrèn, Frenouché, Forlen, poured in, and that man must be prejudiced indeed who does not recognise in these names forms of Orpheus. Also there are a good many ballads about Alexander, or Iskander, how he was the son of a serpent, and how he rode an ox-headed horse, and how a Lamia swallowed him, and returned him to daylight after three months. These folk-songs, of course, in M. Verkovich's eyes, prove an unbroken historical tradition from the time of Orpheus, or even from the first Aryan migration into Europe. His collection amounts to over 90,000 verses, and before beginning to study the poems, M. Dozon enquired how they were recollected. It seems that most of them were taken down from oral recitation by a certain schoolmaster, whom M. Verkovich paid, and set up in a little tavern, frequented by muleteers, who are the great reciters of *pesmas*, or ballads. Now the question arises, did this copyist, Yovan Gologanov, impose on M. Verkovich? M. Dozon says it would not be worth his while. He has a hard time of it, as the muleteers sometimes meet his advances with extreme rudeness, and are reluctant to sing because both the Greek Church and the Turkish Government forbid the recital of *pesmas*. The *pesmas*, indeed,

are almost untouched by monotheistic influences, and revel in any number of gods and other mythological beings. Thus Yovan's *métier* is a rough one, and not well paid, so—M. Dozon argues—he is disinterested. Against this it must be remembered that in his old profession as a schoolmaster he was much worse remunerated, and probably had even a severer life. Besides, he is now paid on commission, so much for each *pesma*. But then, says M. Dozon, how could he display such fecundity of invention and rare facility, as to compose all those many thousand lines? To this incredulous people will reply, as Dr. Johnson said about Ossian, "A man could write such stuff for ever, if he would abandon his mind to it."

And this brings us to the question of internal evidence. The language of the "songs of Mount Rhodope" has all the characteristics of the Bulgarian at present spoken, that is to say, it is a Slavonic dialect, with a mutilated grammar, and with some foreign elements. But the language casts no light on the date of composition, as it naturally changes in the process of oral tradition with the changes in the popular speech. As to manners and religion, "the Bulgarians live in much the same moral world as they did eight or ten centuries ago." The population is still divided into primitive clans, sacrifice is still practised, and the gods of thunder and of rain are adored. Bog or Gospod is the chief deity, the second is Stara Zmeje, which is, being interpreted, the Old Serpent. Fairies, called Judas, and Samovilas, are also a good deal looked up to, and in the *pesmas*, or songs, Sun, Moon, and Stars are living beings. As for poetical merit, the *pesmas*, as far as can be gathered from the specimens printed by M. Dozon, have none at all. They deal with the marvels which Voltaire's Princess Amaside was so tired of, when the Serpent attempted to dissipate her sorrow with Bible stories. "Je suis lasse du soleil et de la lune dont une vieille dispose à son gré, des montagnes qui dansent, et des morts qui ressuscitent." In the *pesmas*, the Sun and Moon are manufactured by the Mother of Gold, and indeed gold is lavished on every kind of implement, on birds and beasts, just as it is in all genuine popular poetry. The *pesmas* too employ recurring epithets, like Homer, and conventional comparisons. The incoherent traditions of Urfen, the nymph's son, with the magic golden flute, and the life passed half in this, half in the other world, certainly recall the myth of Orpheus, but they have much more analogy with the Finnish myth of Wainamoinen. In fact, the easiest way to give an idea of the songs of Rhodope, is to say that they are like the *Kalevala* in wildness and incoherent blending of cosmogonic myths, but that, as far as M. Dozon's extracts show, they have none of the tenderness and appreciation of nature which make the charm of the Finnish epic. M. Dozon's report is, however, a very interesting one, and has a pleasant vein of subdued irony. There can apparently be no doubt that Bulgaria is rich in cosmogonic traditions, only they are such as interest the scientific rather than the literary lover of folk-song.

A. LANG.

Three Essays on Religion. By John Stuart Mill. (London: Longmans & Co., 1874.)

THE first of the Essays in this volume, that on "Nature," is the only one which the author proposed to publish in its present state, and it is the only one in which the several elements of the argument and its structural plan are both marked out with his accustomed clear polish and precision. The two chief senses in which the word is used are first distinguished. "Nature" may mean either the sum and substance of all that is, or it may mean only all that is of itself, unmodified by the will of conscious agents. There is a third sense, according to which "Nature" stands not so much for what is, as for the norm or standard of what must be, with a connotation of approval, which makes "unnatural" still one of the most vituperative epithets in the language. The essay is a criticism, or rather an attack, on the view which sanctions this use of the word and its derivatives. Mr. Mill objects to the Stoical maxim, "Naturam sequi," because all conduct is equally a following or obeying of nature and its laws in the widest sense, while obedience to nature in the narrower sense, in which it is opposed to art, would amount to a brutal and superstitious fatalism, the aim of art being always to improve upon nature. To study nature in order to make the best of it is reasonable, but he does not see any other sense in which man is called upon to make nature as it is the rule or guide of his action, as it should be. "Conformity to nature has no connexion whatever with right or wrong. "Nature" (personifying under that name the universe and its forces) does many things which men ought not to do: it inflicts pain, not only cruelly but unjustly (that is, upon voluntary agents, without any reference to their devotion to the greatest happiness of the greatest number of sentient beings), therefore the general conduct of the universe is not a proper model for human imitation; while a strict regard for every manifestation of every particular natural law would paralyse all forms of human industry at once. These arguments, developed in sixty pages, lead to the conclusion that it is "equally irrational and immoral" for man to "make the spontaneous course of things the model of his voluntary actions."

The first question that suggests itself upon this is, how Mr. Mill came to think the opposite opinion worth controverting. He seems, unconsciously, to have had two sets of opponents in his mind at the same time, and to have aimed at answering them together: first the supporters of the theological view more fully discussed in the essay on Theism; and secondly, an imaginary school of secular optimists. We say imaginary, because, though the admiration felt by poets and naturalists for many natural phenomena is undoubtedly independent of their moral significance or practical utility, and therefore, in Mr. Mill's eyes, lower in quality than the proper moral "admiration of excellence," this admiration is seldom or never extended by those who feel, and value the feeling most, to nature as a whole and without reserve. It is not nature in the abstract, but the nature of particular things or kinds,

which supplies the standard by which their excellence is estimated when they are admired without reference to their use; and in the recommendation to "follow nature," nature means the nature of the kind in its typical excellence as opposed to the casual imperfection of individual specimens. Mr. Mill objects to the notion that human virtues are natural, without, however, explaining what other epithet is more appropriate to specific qualities developed by purely natural, though partly conscious, processes. Mr. Mill's statement is that their consistent exercise is not natural to uncultivated men, which is true in the sense, and only in the sense in which all moral and intellectual consistency is the effect of cultivation, or the organisation of mental habits which persist and influence the conduct even when the conditions which favoured their growth are temporarily altered or even reversed. In all these passages the author seems to revert, without due warning of his intention, to the narrow, secondary use of "nature" to express unconscious, involuntary, unintelligent tendencies only.

The hesitation which it is natural and reasonable to feel in differing from a writer of Mr. Mill's eminence is lessened to his disciples by the very extent of the obligations which they acknowledge; it is not easy to believe that opinions which he has had so much share in forming can be fundamentally and irreconcilably at variance with the complete and final verdict of his deliberate judgment. It seems perfectly consistent with his principles to regard good and evil, in the utilitarian sense of pleasure and pain, as derivatives from the nature of the sentient organism, which includes the property of being pleased or pained by such and such agencies acting in certain defined ways. It is certainly natural, in the broadest sense, for conscious beings to prefer pleasure to pain, but the specific nature of different animals regulates their preference for some pleasure over others, and it is a tenable view that ethical science should deal rather with the nature of man as the source of his tastes than with his tastes as the motive of his actions. Such a development would reconcile the Essay on Nature with at least one section, and not perhaps the least important of those to whom in its present shape it seems to offer a semi-hostile front.

In the second essay, "On the Utility of Religion," we miss the clear definitions with which its predecessor opens, but we find elsewhere that what Mr. Mill understands by religion is "the strong and earnest direction of the emotions and desires towards an ideal object, recognised as of the highest excellence, and as rightly paramount over all selfish objects of desire." Waiving the question whether any special religious doctrines are true, the question whether the existence of religion in this sense is or has been useful to society is clearly open to discussion; the objects of worship may have been habitually ill-chosen, devotion to the ideal may have withdrawn from action powers that were needed for coping with the real; or lastly, a standard of emotional enthusiasm might have been fixed by the few, which the many would compound for their inability to reach, by material sub-

serviency, giving a tempting field to hierarchical abuse. Mr. Mill points out that the habitual coexistence of moral and religious beliefs by no means proves the one class to have been derived from the other, but he attaches considerable importance to the influence of any authoritative expression of the general belief in fixing and perpetuating the belief; the only permanent use which he conceives the cultivation of the religious sentiment as likely to serve is, however, the elevation of individual character by the loftier hopes and broader sympathies which it encourages, or, indeed, in which, to his eyes, it mainly consists. The subtle subjective element, the essence of purely spiritual religion, has, as readers of the Autobiography will be prepared to find, escaped the author's analysis altogether. The emotional reaction of the soul, after prolonged submission to the simpler kind of religious impressions, gives a mood in which those impressions persist, but persist transformed, and appear to the consciousness to be derived from the very disposition which they historically helped to form. It is by dwelling on the manifestations of wisdom and power, of natural and moral beauty displayed in the universe and its actual course, that the greatest religious writers, theistic and otherwise, brought their minds into a mood of genuine, complete, and adoring submission, involving a resigned and even grateful acceptance of the order as a whole, which materially and logically excludes the possibility of condemning its parts on the simple utilitarian grounds which have much and lawful weight with the unconverted. It is unfortunate that Mr. Mill should have taken his idea of orthodox religious feeling from the apologists of the eighteenth century instead of from a few of the classical books of devotional reading which have circulated by hundreds of thousands over Europe since the invention of printing. In all of these it would be found that formal religious exercises as well as material good works are treated as of secondary importance as compared with the cultivation of the purely religious sentiments of love and obedience towards the Supreme Power; but, on the other hand, the proper and inevitable fruits of this sentiment are—according to the ideas of the age—uniformly beneficent, and so far morally unexceptionable from Mr. Mill's standpoint, though of course they do not include a sentiment of moral disapprobation towards their supposed author for his shortcomings in other departments of creation. Supposing it to be a fact that a certain number of ardent and affectionate natures among mankind are naturally led by study and reflection to the general attitude of mind which Spinoza calls acquiescence and love of God, and other writers love, and submission to the Divine will,—the question of the utility of religion turns virtually upon the effect which inculcation of the sentiment is likely to have upon the many in whom it would not develop itself spontaneously; and at this point there is, no doubt, much reason for Mr. Mill's fear that the doctrine that everything is for the best will in practice be interpreted without due regard for the fact that the one thing which is more

emphatically for the best than others is the desire of man to amend himself, his fellows, and their common condition.

The concluding Essay on Theism is naturally the one which will attract most popular attention, and as the general conclusions of it are disastrously portable as well as the least valuable part of the whole volume, it is likely to damage Mr. Mill's reputation as a thinker more than will be found warrantable on a candid study. On p. 132 there is a remarkable passage tracing the rise of monotheism to a growing perception of the solidarity and interdependence of phenomena making it impossible to trace the united whole to the action of discordant wills. It is allowable to believe that in the revision to which all Mr. Mill's works were subjected—the thoroughness of which obliges us to regret his own best critic in himself—the development of this view would have devoured, like Aaron's rod, a good deal of the less effective conjuring with the idea of possibilities of creation and the logical flaws in the hypothesis of omnipotence. The work throughout is that of a logician, manipulating formed impressions and criticising the inferences drawn from these, rather than that of a scientific investigator asking questions of Nature, and accepting her answers as final. For instance, Mr. Mill criticises Descartes' proof of the existence of a God, and observes that the existence of an idea, even though it were universal (which in this case is disputed), still "can only prove the idea and not the objective fact;" a statement which requires some modification if we suppose, what Mr. Mill's idealism would hardly compel him to deny, that human ideas are normally conditioned by external existences, having some relation of parallelism, if not of resemblance to themselves. In spite of this criticism, he is not dissatisfied with the course of his own arguments, although—as might be objected by an atheist—the possibility which he claims to have established for the immortality of the soul and the existence of a benevolent Creator with finite powers, is after all only a logical possibility, turning upon the answer to a question Why? with a But also, why not?

The discussion of the "Argument for a First Cause" is luminous and interesting in spite of its brevity. The permanent and the changeable elements in nature are distinguished, and the experiences of change as always preceding and following other changes, from which the idea of causation is derived, are shown to have no connexion with, and to be incapable of throwing any light upon, either the permanent element or matter of change, or its ideal conditions, the laws of the manifestation of force. Experience, therefore, cannot point even by analogy to the creation or original causing of matter and force, which Mr. Mill is ready to conceive as eternal, failing any real suggestion in nature of the fact or manner of their beginning to exist. But a completely independent and candid thinker is almost certain to hit upon some new and unexpected combinations even in the most hackneyed regions of speculation, and materialists will perhaps be surprised to find Mr. Mill so much prepared to recognise volition as a force *sui generis*, so

different from the other moving agencies in the natural world—such as heat, electricity, or chemical action—as to be, unlike them, conceivably independent in its essence of the material conditions with which, as far as our experience extends, it is uniformly associated. The argument from the existence of mind or intelligence in man to intelligence in the First Cause, if the existence of such a cause could be otherwise established, is rejected on the ground that though minds which have a beginning in time must indeed have been caused, "it is not necessary that their cause should have been a prior intelligence." We have already touched on the author's estimate of the "argument from consciousness," and that "from the general consent of mankind." The stronghold of natural theism is, he thinks, in "the argument from marks of design in nature." He maintains it to be a true and valid inductive argument, according to the Method of Agreement, to say that some of the works of nature resemble the works of man in a circumstance which among the latter is a proof of intelligence in the agent; namely, the conspiring of several chains of causes to effect a single end, as the several parts of the eye to produce the fact of sight. "Sight, being a fact not precedent but subsequent to the putting together of the organic structure of the eye," must be a final not an efficient cause, and the existence of the antecedent idea of it "at once marks the origin as proceeding from an intelligent will." The latter part of the inference Mr. Mill thinks less convincing than the first, because the adaptation might conceivably have been effected by means of natural selection; to which may be added the objection, that even if all the conditions of sight could be traced to a single cause (*e. g.*, the chemical action of light), the intelligence of that cause could not be inferred unless it were previously credited with a desire that men and other animals should be enabled to see.

The interest of the remainder of the essay is almost exclusively historical: it is the last word of the mechanical scepticism which answered to the mechanical belief of the last century; it is Paleyism reduced to an absurdity by emendations which are only too congenial with its spirit. The author's hypothesis is that, perhaps co-eternal, at any rate now co-existing with the natural Elements of matter and force, there is a Being, in the main well-meaning, who has carved Kosmos out of Chaos, with such success as the character of the raw stuff and tools at his command would allow, which is by no means so complete as to prevent certain fractions of the created Kosmos from imagining a better workman, more fortunate in his materials. This view is not put forward as true, or even as overwhelmingly probable; only as sufficiently probable to make it reasonable for those who would be glad if it were true to indulge the hope that it may be so. The condition is not likely to be fulfilled by many. The view itself forms a strong argument in favour of Mr. Mill's estimate of the force of authority in forming opinions. The belief which he found established took possession of his mind as the belief to be accepted, controverted, or corrected; and his denials took their shape from an inverted impression

of the mould of orthodox doctrine. The whole tenour of his earlier writings negatives the idea that he would ever independently have formed conceptions standing to that doctrine in so near a relation of difference as the Manichean hypothesis which he rejects, or the still stranger Trinitarianism to which he finally inclined. As it is, we must be prepared to find some of his least original passages eagerly claimed by theologians as the reluctant concessions and unbiassed testimony of a sceptical mind in favour of some form of supernaturalism.

In conclusion, the cultivation of the imagination, by the indulgence of religious hopes and aspirations, is recommended as a means of giving beauty and dignity to life; but the same and earnest feeling with which the author speaks of the human life he knew only brings into relief his almost pathetic inability to understand some of the less palpable elements of it, at the very time when he was endeavouring scrupulously to mark their place and allow them their due measure of influence. The imagination to him, as to Locke, is the power of making mental pictures; idealisation is making pictures rather prettier or better "composed" than the reality—like a landscape of Claude's. We look in vain for any guess, not to say perception, that the imagination may be a creative force; that the intuitions of feeling may outrun, without contradicting, the conclusions of positive knowledge; or that the disinterested answer of the emotions to influences not yet analysed—perhaps not admitting of exhaustive analysis—is itself one of the prime factors in the future consciousness of its subjects. The whole volume might be described as a Kadmeian victory of common sense over transcendentalism. EDITH SIMCOX.

BAZAINE AT METZ.

The Betrayal of Metz. By G. T. Robinson, F.R.I.B.A. (London: Bradbury, Agnew & Co., 1874.)

THE decision of the court-martial which condemned ex-Marshal Bazaine to death and military degradation appears to have been the pretext for the new name that Mr. Robinson has thought it expedient to bestow upon the work before us, which, we learn from the title-page, is "a new and revised edition of the *Fall of Metz*," a book published by Mr. Robinson in the year 1871. We cannot congratulate him upon his new title, which would seem to imply a history or a narrative of what he is pleased to style *The Betrayal of Metz*. We hold that when an author avowedly writes a work upon the "betrayal" of a fortress, he should place before his readers at least a few properly authenticated facts to show that the fortress in question really was betrayed. This Mr. Robinson fails to do. The volume contains a great many assertions and accusations, but none of these appears to us to be substantiated by proof. For example, the ex-marshal is accused at the very commencement of the siege of "military incapacity," and of being engaged in "political trickery," by a gentleman, i.e., Mr. Robinson, who was not in any way qualified to criticise his behaviour as a military man, nor in a position to know in what political schemes, if any, he might happen to be engaged. Mr. Robinson

may be a very good journalist, but we hope he will forgive us if we say that we should prefer not to accept him as an authority upon the military capacity of a Marshal of France.

We believe we are correct in saying that our author was despatched from England to the seat of war by the proprietors of the *Manchester Guardian*. He reached Paris in safety, stepping out of the station of the Chemin de Fer du Nord just as "twelve o'clock was sounding from all the towers and steeples of Paris" on the morning of August 9, a circumstance which shows that the Paris clocks kept much better time on that occasion than they ever did before or since. He "rushed from the Bourse to the Prefecture in search of news" and eventually to the editors of the *Journal des Débats* and *Galignani's Messenger*, from one of which gentlemen he ascertained that all the English newspaper correspondents had been expelled from Metz. This made him decide upon going there. A train was advertised to start for Metz at eight o'clock the next morning. At the station our author made the acquaintance of a stump orator attired in the uniform of the Eastern Railway Company, who was urging the bystanders to acts of patriotism, and who, besides giving our author various hints as to how to get on to Metz in the event of the line being blocked by the numerous army trains with which it was then encumbered, confidentially informed him that "his oratory was paid for at five francs per hour," and that a man "accompanied him to see that in each hour he orated for thirty minutes at least." We should be the last to doubt the accuracy of Mr. Robinson's account of what occurred, and therefore the only way in which we can account for this extraordinary statement on the part of the railway employé in question, is by suggesting that he must have been some incorrigible *farceur* unable to resist the temptation of taking advantage of the somewhat credulous nature of "our special correspondent."

On arriving at Metz, our author finds everything in a state of "bustle and hurry."

"From all quarters came troops—infantry, cavalry, and artillery. Military train, commissariat, and the myriad of camp followers, *Francs-Tireurs*, Guards National and Mobile, all kept flocking in. The roads were blocked with wagons, and the streets impassable with men. Upwards of two hundred thousand soldiers and civilians were flocking into and around the city. Frossard, with the 2nd *corps d'armée* was coming in fresh from the disgrace of Forbach, Ladmirault with the 4th corps was returning up the Moselle with his back to Berlin. Canrobert with the 6th corps was working up from Nancy and Chalons—places it never ought to have left."

Mr. Robinson does not tell us why Marshal Canrobert's corps ought never to have left these places. For our part we cannot see what good it could have done in face of the thousands and thousands of Germans who poured into Lorraine by way of Château-Salins and Nancy. The Emperor and his generals desired to concentrate a large number of troops under the forts of Metz, and had Marshal Canrobert attempted to hold Nancy or Châlons as Mr. Robinson suggests, he would probably have been cut off from Metz altogether, and crushed by

superior numbers. This, indeed, is borne out by what Mr. Robinson himself says a little later on:—

"Hardly had I set foot within its gates (Metz) when I heard that the Prussians had occupied the route I came by, and that Frouard, and with it our direct communication with Paris and Strasbourg, was in their hands."

Our author is very dissatisfied with what he sees at Metz. There was "hardly a single gun mounted on its walls, and not one of those external forts the increased range of artillery had called into existence was finished." This sounds very like censure, and if it is intended as such, it is certainly undeserved. Anyone who is acquainted with Metz must be aware that the act of placing guns on the walls of the fortress is a mere matter of form. The city is defended by detached forts which occupy several of the most prominent neighbouring heights, so that before a shell can be thrown into it or a cannon-ball strike its walls, it would be necessary to capture one or more of these detached strongholds, a thing that could only be accomplished by assault or through the forts running short of ammunition. Although some of these forts were not quite finished, as far as the brickwork and the earthworks were concerned, we believe that they were almost completely armed when Mr. Robinson arrived in Metz.

Again, our author says: "At Metz, the town was certainly incapable of resistance," but he does not tell us whether he means it was incapable of resisting famine, bombardment or assault. We had always thought, and it is still our opinion, that Metz was one of the strongest fortresses in France, owing to the detached forts to which we have just referred, and it therefore appears to us that the duration of its resistance would depend on the quantity of food and ammunition it happened to possess at the time it was besieged, and of these, we believe, it had a fair amount. Indeed, Mr. Robinson shows his own inconsistency at p. 133, where he speaks of "those new earthworks which we raised in every direction to strengthen the already strong fortress of Metz."

Mr. Robinson's first object on reaching the city was "to find out as much as possible the military disposition of the forces round it," and he accordingly made an excursion to the eastern side of the fortress. He was so satisfied with his ride that he made a similar journey on the following day. This time, however, he was arrested as a spy and taken before Marshal Bazaine, who eventually allowed him to go free. On his way to the Marshal's quarters he passed "the future fortalice of Des Bordes," which was still unfinished, and it is his opinion that, if it had been completed,

"the battle of that morrow, which was then coming, need not have been fought, the army of the Rhine need not have been delayed for those two fatal days of Gravelotte and St. Privat, and the bodies of some 60,000 French and 70,000 German soldiers need not have enriched the already fertile soil of the valley of the Moselle."

The best way to have avoided the battle of Borny or Courcelles, to which Mr. Robinson refers, would have been for the French Government to have permitted Marshal

Bazaine and his army to retreat from Metz during the week that followed the disastrous 6th of August. As it was,

"by the 13th General Steinmetz with the First Army had approached Metz on the northern side. Prince Frederick Charles had placed a portion of his army within a few miles of the fortress on the east, and with the rest was actually crossing the Moselle at Pont-à-Mousson, preparing to cut off the French army if it should move, or to invest it if it should stay in its place." (See *Daily News Correspondence*, vol. i., p. 55.)

So that the fact of the fortalice of Des Bordes being finished or unfinished had nothing whatever to do with the matter.

The battles of Borny, Rézonville, St. Privat, Ladonchamps, and Servigny, are described by our author in the picturesque style often adopted by special correspondents and novelists. We have nothing to say against this style of writing as a style. It has, however, one drawback, namely, that it fails to give the reader any clear idea of the battle-field, or of the movements effected by the troops. The day after the battle of Borny, our author, accompanied by some friends, visited the battle-field with the laudable purpose of assisting the wounded. They seem to have varied this very commendable action by collecting what Mr. Robinson calls Prussian trophies, with which they returned to the city. At the gates they were stopped and asked to show what papers they might have about them establishing their identity, which, considering that Metz was in a state of siege and that they were coming from a battle-field occupied by the enemy, on the day following the battle, does not seem to us to have been a very extravagant request. But Mr. Robinson indignantly exclaims: "Although we have been on a mission of mercy, we are treated as spies and rudely dealt with. How Frenchmen submit to this sort of thing is a mystery beyond solving." He forgets to tell us that his "mission of mercy," although highly creditable to himself, was entirely officious; besides, the French authorities at the gates of Metz had no means of ascertaining what he and his friends had been doing on the battle-field of Borny. In describing the battle of Rézonville, he is very angry because General Bourbaki and the Imperial Guard breakfasted before going into action, and a few pages further on he expresses his wrath at the doctors having breakfasted previous to seeking the field of battle. Does Mr. Robinson suppose that the German soldiers went into action on empty stomachs, or that the German doctors proceeded to operate on their patients without having previously satisfied the cravings of hunger?

In the chapter entitled "Blockaded," we find an interesting account of an Austro-American, named Schull, who seems to have acted the part of spy to both parties, and who was eventually captured and shot by the French; and in chapter xii. is the copy of a proclamation which effectually establishes that the Germans were in the habit of shooting the *Francs Tireurs* who had the misfortune to fall into their hands.

"PROCLAMATION."

"The Commandant in Chief of the Second German Army again makes it known that each indi-

vidual who does not belong to the regular French army or *Garde Mobile*, found bearing arms under the name of *Franc Tireur* or other designation, will be considered as a traitor, and hanged or shot at the place where he is taken, without further consideration."

Mr. Robinson's anxiety to communicate with the *Manchester Guardian* seems to have given him the idea of making paper balloons for the purpose of sending letters out of the fortress. He obtained the necessary permission from the military authorities, and made several small balloons, which carried some thousands of letters out of Metz, among which were several of his own. Some of the balloons were captured by the Prussians, who returned the letters to Marshal Bazaine. This happened more than once, and the Marshal at length decided that no more balloons should be sent off. Of course Mr. Robinson was very angry at this, and in his rage at being deprived of the means of sending off his letters, he savagely accuses the Marshal of complicity with the enemy.

We have already devoted too much space to this book, which, although written pleasantly enough in parts, will never possess any weight as an historical work. The author apparently went, unprovided with a single letter of introduction, to a besieged fortress in the capacity of a newspaper correspondent, and it so happened that the military authorities, instead of receiving him with open arms, rather snubbed him. It is not unnatural that he should have felt annoyed, but he is hardly justified in finding fault with almost everything and everybody. In his anger he makes the most sweeping accusations and assertions such, for example, as the following:—

"We knew with much bitter disappointment that though the cordon was too well maintained to allow of the escape of a single person, there were at least half-a-dozen points of this imaginary line at which a sortie might have been made, even up to the last day of the siege."

Unsupported by the slightest particle of proof he accuses the ex-Marshal of want of brains, heartlessness, military incapacity, and of being engaged in political trickery almost at the very commencement of the siege; and he is extremely enraged against him for being partial to the very innocent game of billiards. That ex-Marshal Bazaine was out-generalled by his German opponent we firmly believe; that he failed in his duty as a soldier by meddling in politics, by holding communication with the enemy when he found it impossible to escape from Metz, with a view to favouring the interests of the deposed dynasty, and by surrendering the army and fortress entrusted to him before he was absolutely compelled, we are also ready to admit; but to insinuate that he wantonly sacrificed his army, that he was wanting in brains, or that he displayed any extraordinary military incapacity, is as cruel as it is untrue.

We do not think that the apology recently published by the *New York Herald* is likely to do the ex-Marshal much good, for in it he endeavours to exculpate himself by showing that others were equally unsuccessful, forgetting, however, that two wrongs do not make one right. Nevertheless, this

apology contains certain truths that it is but fair to plead in his favour. He says:—

"My comrades, accustomed only to record victories, really thought that it was impossible that they should be conquered. In this respect they had been spoiled by the campaigns of the Crimea and Italy. Moreover, the French people had made too much of the victories of Africa. Our misfortunes arose from our numerical inferiority, and from the defects of our organisation."

"I found myself with an army yet in course of formation, which was not in the hands of its chiefs, whose very drill was not completed, whose right wing was already routed, and which had often to fight against the Germans, one against two, and to find itself turned and surrounded in an entrenched camp."

"I have been accused of being too much of a politician. . . . I remembered that I had sworn allegiance to the Emperor, to his heirs, and to the Imperial Constitution."

We believe that ex-Marshal Bazaine did all in his power, as a soldier and a Frenchman, to defeat the enemy of his country in the battles of Borny, Rézonville, and St. Privat. Afterwards he stood no chance of cutting his way through the besieging forces, and he should then have endeavoured to hold the city as long as he possibly could. Whether he would have succeeded in getting away had he pushed on on the night of August 16, as it has often been asserted he could, is a question which he and the generals who accompanied him were best qualified to decide. It is easy enough to sit at home in one's arm-chair and criticise a general's movements, but, in doing so, we must not forget that soldiers are made of flesh and blood as well as the rest of us, and that the human frame is unable to sustain more than a reasonable amount of fatigue.

EDWARD HENRY VIZETELLY.

The Sacred Anthology. A Book of Ethnical Scriptures, collected and edited by M. D. Conway. (London: Trübner & Co., 1874.)

THIS book shows what may be achieved by enthusiasm and perseverance. Mr. Conway tells us that he is not an Oriental scholar, but he has given us what no Oriental scholar has yet given to the world, though for many years the world has been expecting and demanding something like a Sacred Anthology, viz., a collection of the most important passages from the sacred writings of the East, translated into English. As Oriental scholars shrink from the undertaking, Mr. Conway set to work, collecting all the translations which he could find ready to hand, and extracting from them whatever seemed to him of real value. Scholars, no doubt, will find many things to object to in his translations, for it is not with regard to the Old and New Testament only that translators differ, and call each other hard names. To the historian of religion, also, many things may seem to be wanting which are necessary for conveying a correct idea of the character of each religion, and more particularly for exhibiting before our eyes the phases of their gradual development. But Mr. Conway was not dismayed by these difficulties. He knew what he could, and what he could not do,

and by limiting the scope of his undertaking, and giving to his collection a purely practical character, he has certainly succeeded in accomplishing a useful and important task. "He believed," as he tells us, "that it would be useful for moral and religious culture if the sympathy of religions could be more generally made known, and the converging testimonies of ages and races to great principles more widely appreciated." If we may judge by the rapid succession of editions, Mr. Conway has certainly roused by his *Sacred Anthology* a wide interest in a subject hitherto strangely neglected, and he will have rendered an important service, if it were only by dispelling some prejudices most detrimental to a true appreciation of the value of all religions.

Those who study the history of the human race in all its various phases, from the lowest savagery to the highest civilisation, know that neither in the most perfect work of discursive thought, nor in the grandest achievements of creative art, has the human mind put forth all its powers in greater force or fullness than in religion. We are, from our very childhood, so familiar with the highest religious conceptions, that it is difficult for us to appreciate the mental struggles by which they were conquered and secured for us. We forget that the simplest conception of the Divine requires an almost superhuman effort, and was therefore among most nations ascribed to a divine revelation. We forget that every name of the Deity was the reward of more than one sleepless night at Peniel, and that even in a prayer, such as the Gâyatri, are hoarded up the scant earnings of the patient labours of many generations. That tribes, even in the lowest scale of civilisation, should address a Being whom they have never seen, as their Father, that they should never for one moment doubt his existence, should regulate their lives by what they suppose to be his will, should actually offer to him what they value most on earth, may no longer strike us as extraordinary, but in itself it is more marvellous than anything else in the whole of human nature.

And what is more marvellous still, is the striking uniformity with which that power of religion has manifested itself almost everywhere. There are differences, no doubt, and profound differences between the religions of the world, but the similarities far outweigh these differences. Let readers open Mr. Conway's *Anthology*, without looking at the references, and they will find it by no means easy to say whether any given extract comes from a Jewish, a Mohammedan, or a Hindu source. Mr. Conway has arranged his extracts according to subjects. We find passages on Charity, Nature, Man, Humility, Sorrow, and Death placed together, and these passages are taken promiscuously from all the sacred books of the world. No doubt we at once recognise the extracts from the Old and New Testaments, particularly when they are given in the authorised version; but even these, if translated more literally or more freely, might often be supposed to be taken from the Buddhist Canon or from the Chinese King. The same sentiments, sometimes in almost the same words, occur again and again in all the sacred books of the world.

What we should have wished would have been a more strictly chronological arrangement of these extracts. A passage from the hymns of the Rig Veda and a passage from the Bhagavadgîtâ, or from Kabir and Nânak are no doubt all of Hindu origin, a Gâthâ of the Avesta and a poem of Faizi are both Persian, but the distance between them is far greater than between the sacred books of different countries. A hymn of the Rig Veda by the side of a poem of Omar Khayyam looks very strange, and we miss, particularly for the later development of religious thought in India, extracts from the Upanishads, which would have yielded beautiful contributions to a Sacred Anthology.

It is hardly surprising that a perusal of Mr. Conway's *Sacred Anthology* should have left on many readers the impression of the great superiority of the Biblical extracts, if compared with the rest. The fact is, that what we call the beauty or charm of any of the sacred books can be appreciated by those only whose language has been fashioned, whose very thoughts have been nurtured by them. The words of our own Bible cause innumerable strings of our hearts to vibrate till they make a music of memories that passes all description. The same inaudible music accompanies all sacred books, but it can never be rendered in any translation. To the Arab there is nothing equal to the cadence of the Korân; to us even the best translation of Mohammed's visions sounds often dull and dreary. This cannot be helped, but it is but fair that it should be borne in mind as a caution against declaring too emphatically that nobody else's mother can ever be so fair and dear as our own.

One of the most eminent Oriental scholars expressed the following judgment as to the relative merits of the Sacred Scriptures of the world:—

"The collection of tracts, which we call from their excellence the *Scriptures*, contain, independently of a Divine origin, more true sublimity, more exquisite beauty, purer morality, more important history, and finer strains both of poetry and eloquence, than could be collected, within the same compass, from all other books that were ever composed in any age, or in any idiom. The two parts of which the Scriptures consist are connected by a chain of compositions which bear no resemblance in form or style to any that can be produced from the stores of Grecian, Indian, Persian, or even Arabian learning; the antiquity of those compositions no man doubts; and the unstrained application of them to events long subsequent to their publication, is a solid ground of belief that they were genuine compositions, and consequently inspired."

Would any Oriental scholar endorse this judgment now?

We have intentionally abstained from all critical remarks with regard to the translation of single passages. Such remarks might be addressed to the translators, but not to Mr. Conway. He deserves our hearty thanks for the trouble he has taken in collecting these gems, and stringing them together for the use of those who have no access to the originals, and we trust that his book will arouse a more general interest in a long-neglected and even despised branch of literature, the Sacred Books of the East.

MAX MÜLLER.

RICHTER'S MEROVINGIAN ANNALS.

Annalen der Deutschen Geschichte im Mittelalter, von der Gründung des Fränkischen Reichs bis zum Untergang der Hohenstaufen mit fortlaufenden Quellenauszügen und Literaturangaben. Ein Hülfsbuch für Geschichtslehrer an höheren Unterrichtsanstalten und Studierende. Von Dr. Gustav Richter, Prof. am Gymnasium zu Weimar. (Halle: Buchhandlung des Waisenhauses, 1873.) Abtheilung I. Annalen des Fränkischen Reichs im Zeitalter der Merovinger.

PROFESSOR RICHTER has produced a useful book, especially useful to historians, whether they have themselves laboured in the period treated of, or, being themselves occupied in other fields, are desirous of obtaining a brief but trustworthy account of that which is known, and of that which is not known, about the Merovingians. It is true that the author, as his title shows, had another object immediately in view. He has a clear conviction that the teachers of history in the upper classes of the higher schools of Germany ought to be in close contact with the progress of enquiry, or at least to be well informed of the results obtained from time to time. As, however, these teachers have, as a rule, neither the time nor the means for prosecuting such enquiries for themselves, he has been desirous of laying before them in a concise form, all that is indispensable for tracing the known facts of history to their original sources. In this way he would place such teachers in a position to feel themselves at home among the authorities upon which history depends, and to guard themselves against traditional errors.

Professor Richter has drawn up his work in the form of tables. The events are arranged under the year in which they occur, and a commentary is added to give the necessary explanations. Such a book resembles to some extent Peter's *Zeittafeln für alte Geschichte*, or Clinton's *Fasti*, but it is drawn up on a far more extensive scale. The commentaries often are extended into complete treatises. The questions suggested are not at once answered. The author, instead of simply stating his own view, prefers adducing the arguments on both sides, and it is only in the end that we obtain his well-considered judgment. For this reason the book is far more valuable to the investigator who is in a position to be able to follow up the clue offered to him, than it can possibly be to a teacher, who has no more to do with the authorities than so far as he can gather them out of the book itself. As, too, the author has taken a very insufficient measure of the wants of school teaching in the selection of his materials, it is better to regard the book at once as one prepared for the use of historians, and to treat it as such.

As Professor Richter has not aimed at completeness in his quotations from original authorities and modern literature, and as it would be impossible to attain to it in such a work, it is unnecessary to dwell upon omissions, and it will be sufficient to mention that some notice should have been taken of the Chronicle of Sulpicius Severus, printed in the fourth volume of *España Sagrada*.

In accordance with the annalistic cha-

racter of the book, it will be best to direct observation to special points.

At page 2 Professor Richter says rightly that the Franks were a confederacy of tribes which cannot be shown to have been originally connected by kindred. They were partly of High German, partly of Low German race. This is one of the most striking proofs of the worthlessness of the traditional view that the formation of the German states proceeded from the races, and was influenced by their affinities and differences. Paul Roth, in his *Feudalität und Unterthanenverband* (Weimar, 1863), showed with the greatest ability that the formation of states constantly overstepped the limits of the races. Even the Gau did so. From the earliest times the Lech formed the boundary between the Bavarian and the Allemannian races, but the Augsgau, in which Augsburg lies, is upon both sides of the Lech.

Under the year 437 we have the terrible battle in which the kingdom of the Burgundians at Worms was overthrown. Its echoes are still sounding in the Nibelungenlied, where it has assumed the legendary form of a slaughter in Attila's court. Even Paulus Diaconus speaks of Attila as the destroyer of the Burgundians, having drawn his information, as Waitz has shown, from Prosper's *Chronicle*. Prosper, however, used the words "Chunni deleverunt," whereas Paulus substitutes "Attila." It is impossible to say whether he was influenced by the popular legend in making the change, but it is beyond doubt that his statement is entirely valueless. Professor Richter ought not to have said that Waitz has shown its worthlessness to be probable. It is absolutely certain. After the Germans began to found independent states in the Roman Empire, the Romans often took Huns into their service, and it was by such a band of Huns that the Burgundians and their King, Gunther, were destroyed.

At page 26 the author ought to have mentioned the prevailing belief that there was a persecution of the Catholics under the Visigoth Euric, and to have shown it to be erroneous. An accurate knowledge of the condition of the Visigothic kingdom is of the greatest importance to a right understanding of the progress of the Franks.

At pp. 27-32 Professor Richter founds his description of the oldest constitution of the Salian Franks upon the *Lex Salica*. In addition to the works of Waitz, which opened the way to all our real knowledge of these matters, he has made great use of the *Fränkische Reichs- und Gerichtsverfassung* of R. Sohm (Weimar, 1871), which he chiefly follows in disputed points, as, for instance, when he adopts Sohm's view that civil rights and duties in the old German state depended on simple freedom, and were not limited to the holders of land.

It cannot be said that the author has treated the rise of kingship among the Franks in an adequate manner. The view which he adopts (p. 29, note 3), that kingship of a tribe was developed out of the kingship of a Gau is correct, if he only means to deny that the kingly power in the states formed after the migration was derived from any sort of grant from the Roman Emperor. But we learn nothing from the statement about the

mode in which the change was effected. What is of greater importance is that the opposition between kingship of a tribe and kingship of a Gau has nothing to do with the matter. The distinction which ought to have been drawn is between kingship in the old German state on German soil, and kingship after the migration in the Romano-German states formed upon Roman soil. Even if we pass over the fact that these states were not always founded by complete tribes, and that the leading body was often joined by important numbers from other tribes, we have to look for the great differences which exist between the constitution of the newly-formed states and the original constitution of the older ones, not merely to the kings come to rule over more than one Gau, but to the fact that the state was now founded upon Roman soil, under the influence of completely new economical, scientific, and ecclesiastical conditions, and that a great part, perhaps the greater part, of its citizens were Romans. These Romans were not mere subjects. They had a share in the state, bore its burdens, and fulfilled the duties of its offices as well as the Germans. Professor Richter ought to have said this clearly, especially as he mentions that the Romans did not altogether enjoy equal rights with the free Franks, that is to say, that their Wergeld was less, and that they had special taxes to pay. Yet in spite of this they were citizens in all the three German states founded in Gaul, among the Visigoths, the Burgundians, and the Franks. After the year 600 it was impossible to know whether any man was a German or a Roman by origin, as, for instance, has been proved in the case of Fredegar by Brosien, and in the case of the author of the texts of the *Lex Salica* by the present writer.

More too should have been said about the manner in which the German settlements were formed. Whatever disputes the question may have led to, it is at least certain that, wherever a division was made, each estate was divided, so that the lands of the Romans and Germans were interspersed like the squares of a chess-board. At page 23 the notice of this is too brief.

The widely-spread notion that the kings of these states were originally Roman officials of some kind is also inadequately dealt with, though the author has treated at length of far less important matters. In the *Preussische Jahrbücher* the present writer has treated of the rise of German kingship, and has argued against this view of the case. It will be enough here to produce the additional evidence from Paul Roth's *Feudalität*, that an oath of fidelity was taken from the people by the Frankish kings—an oath which was entirely unknown to the Roman Constitution, and which, at least, could never have been offered to a Roman official.

At page 35, under the year 492, in speaking of the marriage of Clovis, mention is indeed made of Binding's conclusive investigation in his *Geschichte des burgundisch-romanischen Königreichs*, but only as if it were one amongst other equal authorities. Binding has proved beyond doubt the fabulous nature of the story that the Burgundian king Gundobad had slain his brother, and

that it was in order to avenge her father that, at a later period, this brother's daughter, Chrodechilde, urged her own and Clovis' sons to an attack upon Burgundy. The evidence for this ought to have been given in the text.

At pages 108-150 the tabular order is interrupted to give a connected view of the Merovingian Constitution. Here too in disputed points Professor Richter follows the clear-sighted views of Sohm. In the last section, which ends with the coronation of Pippin, it is only necessary to remark on the mode in which the author gives the disputed point about the secularisation of church property by the sons of Charles Martel (p. 208). It is not satisfactory. We have a whole series of references to original authorities and to modern literature, but we have no general view of the position of the question, or even any clear statement of the author's opinion. He gives us at length Jaffe's explanation, an explanation which is in the main entirely wrong, and which was no more than an *obiter dictum* of that writer. The real history of the matter is that as the freemen were more and more falling into dependence on the great men, the old military arrangements of the Franks fell into decay. For they were based upon a general levy of freemen, and even at the beginning they had only been fitted for small states with wars of no great length waged close to their borders. For this reason the kings were obliged to make increasing claims upon the service of the great men and their dependants, and to reward them for their service with grants from the royal estates. In time these were exhausted, and Charles Martel then adopted the expedient of making his officers bishops and abbots, so as to obtain for them in that way the enjoyment of the church lands. In this way the Church was sinking into barbarism, and his sons under the influence of Boniface deposed these nominal ecclesiastics and allowed the vacant bishoprics and abbeys to be canonically filled. On the ground of this concession they laid claim to a large part of the Church property, in order to satisfy or to win the great men. They took care that each church should retain as much as would enable it to exist, and ordered that the lay holders should pay to the churches a rent from these ecclesiastical estates, which were considered as land held from the head of the State. Besides this, they engaged that, in quieter times, a complete restitution should be made. Even the synods gave their assent to this secularisation, and the Pope expressed himself satisfied with the arrangement.

Such at least is Roth's explanation. The older view to which it is opposed is that the greater part of the Church lands was in the hands of the laity in the time of Charles Martel, that his sons restored a part of this, and only claimed the right of leaving the remainder for a time in the hands of their great men. Roth is doubtless right in the main. There was a general secularisation legally sanctioned. His principal mistake is that he refuses to allow that even in the time of Charles Martel some lands were withdrawn from the Church, and that on this account his sons when they came to make legal arrange-

ments for secularisation, restored to the most deeply injured churches a part of their property. It is curious that Roth only struck out these too-sweeping ideas in the heat of argument in the second book which he published on this subject, *Feudalität und Unterthanenverband* (1863), while, on the contrary, his opponent Waitz at first recognised the value of Roth's main position (*über die Anfänge der Vassalität*, 1856), but afterwards retreated to his original ground which had been attacked by Roth. More about this subject will be found in two articles contributed by me to the *Jahrbücher für Nationalökonomie und Statistik* (Jena, 1874).

Many other points in the book are worthy of attention, as well as the manner in which they have been dealt with by the author. But it is in the nature of the case that a book of this kind should be of unequal merit, and such failings need not hinder us from thanking Professor Richter heartily for the useful assistance which the historical enquirer may derive from his book.

GEORG KAUFMANN.

NEW NOVELS.

Charlie Lufton. By G. Cameron. (Northallerton: printed for the Author by J. Vasey, 1873-4.)

Lost for Love. By the Author of "Lady Audley's Secret." (London: Chatto & Windus, 1874.)

Woman's a Riddle; or, Baby Warmstrey. By Philip Sheldon. (London: H. S. King & Co., 1874.)

It would be somewhat unkind, and indeed would hardly be fair, to apply the ordinary canons of novel criticism to Mr. Cameron's work. It is one of those productions which are quite justifiable if we look at them with reference to the producer, although they can hardly be recommended as possessing any positive merit of their own. It was, doubtless, a good thing for Mr. Cameron, who is, he tells us, a watchmaker, to spend his leisure hours in writing *Charlie Lufton*; indeed, it is hardly possible that the effort to express one's thoughts, as Mr. Cameron has, on the whole, succeeded in doing, grammatically and intelligibly, should not have some beneficial effect on the mind of the writer. So that the benevolent persons who appear to have subscribed to *Charlie Lufton* may consider themselves to have done a rational and praiseworthy, as well as a good-natured thing. But it would be very difficult to discover any merit in the performance as a performance. Mr. Cameron has yet to learn (for the matter of that so have thousands of other people) that novel writing, so far from being appropriate to a *coup d'essai*, is about the hardest of all tasks which an author can set himself; and that nothing but transcendent genius, or else a very happy combination of reading, observation, and taste, can possibly ensure success. But he may console himself (we are very sorry that it is necessary to repeat it) by the thought that ninety-nine out of a hundred educated people share his delusion, and do their best to spread it by encouraging such works as figure in the average novel list.

It would be very hard to show cause why

Miss Braddon's last novel should not be classed among the works just referred to. It has, of course, some of the merits which practised workmanship is sure to confer upon the most pot-boiling work; that is to say, the story is reasonably well put together, there is no glaring impossibility of character or of incident, and the writing (we suppose Greuse and a few other such things may be put down to the long-suffering printer) is fairly careful. The characters are not very many. Dr. Ollivant, a successful physician of a fearfully conventional type, falls in love with Flora Chamney, daughter of an old friend and schoolfellow of his. The young lady naturally loves somebody else—Walter Leyburne, an almost equally conventional artist, who has a good deal of money; and Mr. Leyburne, true to the immortal axiom of Augustus Moddle, loves (in a hesitating and half-unconscious manner) yet a fourth personage, Louisa Gurner, daughter of a picture-cleaner, and much the best figure in the book. Flora and Walter become engaged, and the doctor pitches Walter off the usual cliff, and has to pay the usual hushmoney to the picture-cleaner, who has happened to be a witness. The latter picks up Walter, revives him slowly, and induces him to marry Louisa, with whom he lives happy ever afterwards. Flora meanwhile, after much despair at her lover's disappearance, marries the doctor, learns the story of the cliff, leaves her husband, and returns to him in a manner which may be easily imagined, or, if that be too much trouble, read. By far the most amusing as well as the most natural thing in the book, is the intensely feminine irrationality of Flora's conduct, an irrationality which the writer, to the increase of our amusement, quite fails to perceive. Flora is represented as leaving her husband, not at all from horror at his being a murderer, but from pique at his having concealed the truth from her, regardless of her sufferings of uncertainty. She returns to him when she discovers that Walter is alive (though this obviously makes not the slightest difference in the doctor's conduct), and because she finds that Walter also has been regardless of her feelings in not letting her know of his revival. This is a delightfully natural touch, and the more delightful because unconscious. The elevation of one's own feelings into a standard of right and wrong, and the doctrine that A's offence against the standard is obliterated by B's ditto, are both charming. A. inflicts great pain upon me, therefore he is a wicked scoundrel; but B. might have spared me that pain and did not, therefore A. is guiltless. The point is worthy to be prelected upon by any Professor of Moral Philosophy.

If Mr. Philip Sheldon (we rather think his name ought to have been Philippa) had written *Woman's a Riddle* in any other form than the one which he has adopted, it would have been a much better book. It is really astonishing that when people write novels they should not reflect on the immense difficulties in which the use of the first person will involve them. Only by a never-failing employment of the most ingenious artifices, is it possible to make personal narrative at once probable and interesting; and Mr. Shel-

don has disdained to use any artifice at all. The story told by Miss Rudd, the governess, is strictly confined to what Miss Rudd actually saw and thought, and is therefore almost of necessity monotonous and uninteresting. The spokesman in a novel should either be the central figure, or else should be supposed to know everything. Miss Rudd neither is the one, nor does the other. Consequently we are deprived of the necessary details and circumstances without which a story, unless it be in very exceptional hands, is sure to languish. This is the more to be regretted in that, among much commonplace character and incident, Mr. Sheldon has stumbled upon one figure which in skilfuler hands might have been made a really great creation. This is Katherine Ludlow, the "riddle" of the first title. She is the niece of a stiff and precise baronet, Sir Gervase Warmstrey, whose sister had made a *mésalliance*. The baronet, never forgiving his sister, has adopted her orphan daughter, and is trying to form her. But the process of formation is so difficult, owing to Katherine's coarse nature, headstrong temper, and total want of previous education, that Sir Gervase at last gives it up, marries a good and pretty simpleton, "Baby Warmstrey," as Katherine contemptuously calls her, and transfers his educating attentions to his wife. The result is rather disastrous, but Sir Gervase dies suddenly before any great harm is done, leaving all his property to his wife, except three hundred a year, which he settles on Katherine. The latter, with all her wilfulness, had set her heart on being heiress, and never having forgiven the marriage, becomes even more implacable towards Lady Warmstrey, who soon after marries a scapegrace cousin, Captain Philip Tavener, with whom she has long been in love. Tavener and Katherine appear to be deadly enemies, but this appearance is delusive, and Katherine avenges herself on her supplanter by eloping with the Captain. The blow kills Baby Warmstrey, and the book ends. This is by no means a bad plot, and the character of Katherine Ludlow stands out in bold and welcome contrast to the common herd of novel personages. Unfortunately, the author has not known in the least what to do with his windfall. If he had devoted a little less time and pains to the task of exhibiting Miss Rudd as a sensible and right-minded woman, Sir Gervase as a precise and foppish old fool, and Lady Warmstrey as an innocent in the Scotch sense, all which personages we know *ad nauseam*, and had spent a little more upon elaborating Katherine's character and ways, he might have made a great success. As it is, he has made her vulgar instead of impassioned, stupid instead of enigmatical, coarsely vicious and sulky instead of tragically revengeful. Altogether, it is difficult to close *Woman's a Riddle* without a portion of the feeling with which one regards a drawn woodcock or an unwarmed bottle of Madeira.

GEORGE SAINTSBURY.

CURRENT LITERATURE.

Memoir of Cosmo Innes. (Edinburgh: William Paterson, 1874.) In our issue of August 15 last, we printed a slight biography of the late Professor Cosmo Innes, contributed by Dr. J.

A. H. Murray. *A Memoir of Cosmo Innes* appears to touch upon much the same points in his career as those which were selected for notice by Dr. Murray, though not without throwing additional light upon his character. It is a little quarto volume of 83 pages, with a short preface explaining that this "brief and imperfect memoir is attempted more in the hope of pleasing his many friends of all classes than of satisfying the literary world." We think the author has succeeded in both these attempts. The Memoir is written in a kindly spirit, and evidently by a person who had been most intimate with the deceased. Mr. Innes, who was essentially a studious man, was of opinion that much open-air life, keenly enjoyed, is favourable to study. Mr. Innes was a Greek scholar of no mean order, and soon after his marriage was offered a judgeship in Corfu, for which a Greek scholar always has to be selected—but for family reasons this appointment was declined. He was a frequent contributor to the *Quarterly Review* while under the editorship of Mr. Lockhart, and a leading member of the Maitland and Bannatyne Clubs. Mr. Innes' writings were so entirely on the Catholic side that distinguished Catholics, among others M. de Montalembert, sought his society, and it was to show that he could see both sides of the question that Mr. Innes published his "Scotland before the Reformation" in the *North British Review*, at the time it was written perhaps the most popular of his Review articles. His archaeological labours were very prolific, scarcely a year passing without his bringing out some new work or editing some ancient chronicle: an account of all these is given at pp. 55, 63, 64 of this Memoir. His last and greatest work—the collecting, editing and indexing the Acts of the Scots Parliament from 1104 to 1707—Mr. Innes did not live to see quite completed. He left it, however, within a few months of completion.

Première Expédition de Jeanne d'Arc. Le Rapprochement d'Orléans. Nouveaux documents. Plan du Siège et de l'Expédition. Par M. Boucher de Molandon, de la Société Archéologique et Historique de l'Orléanais, &c. (Orléans, 1874.) The literature relating to Joan of Arc is now very voluminous, but notwithstanding the great amount of study and research already devoted to the subject there are points of some importance still in controversy as to the manner in which she conducted the first supply of provisions into Orléans. Some have even questioned whether the city was completely closed in by the English, a point which, however, seems to have been set at rest by the recent discovery of the remains of a redoubt in the only place where it was suspected that the line of fortifications was incomplete. Others have started the theory that the provisions were conveyed into the city by land and not by water. Authorities differ, also, as to the strength of Joan's escort, and it does not quite appear why this escort returned to Blois instead of going with her into the city. M. Boucher de Molandon, who has passed his life on the scene of the Maid's great achievement, has devoted much time to the study of these questions, and sets forth the result of his investigations with great clearness. The numerical force of the convoy given to Joan of Arc he believes to be over-stated by nearly all, if not actually by all the authorities. He proves incontestably by documents from the municipal archives of Orléans, that the victuals were conveyed by water from Chécy, and he considers that the escort returned to Blois after Joan had embarked, simply because it had discharged the duty imposed upon it, not, as has been supposed, with a view of crossing the river and marching against Orléans on the north side.

He has also been fortunate enough to meet with other documents of interest, of which one deserves notice as showing in a remarkable manner the straits to which the English government was reduced to maintain the siege. On March 3, 1429, every man in the besieging army was

ordered to lend the King a quarter's wages to meet the expenses of the siege, on pain of forfeiting half a year's pay.

The volume is altogether a valuable contribution to history.

We are glad to find that there has been sufficient demand for Mr. Peacock's *Army Lists of the Roundheads and Cavaliers* (Chatto & Windus) to call for a second edition. Such books do not appeal to the general public. But their value to the student is incalculable. Those who know Professor Masson's *Life of Milton* will remember the labour which he spent on lists of this kind, and may easily imagine what a relief it would have been to him if he could have found the work done to his hand. The particular lists which Mr. Peacock has reprinted relate to some date in the first two months of the year 1643, after Edgehill had been fought, and while the fortunes of the combatants were trembling in the balance. Mr. Peacock has accompanied all the names of importance with a short biographical commentary. He has also printed other lists, from one of which it appears (p. 68) that Cromwell, before being a colonel of horse, served as an ensign of a foot regiment. Of course the information to be derived from this book is endless. It will be enough here to note one curious coincidence. Amongst the officers general of the Parliamentary horse occur (p. 22), following one another, those of "Sir William Belfore, Knight, Lieutenant General," and "John Dulbier, Quarter-Master General." Are these the same Balfour and Dulbier who were sent over by Charles to levy German horse in 1628, to overawe, as was popularly supposed, the Petition of Right Parliament? Again, if this Dulbier is the same as the Colonel John Dulbier of whom Mr. Peacock tells us at p. 53, that Cromwell learnt from him "the mechanical part of soldiering," he is to be congratulated on his pupils. Probably no master of drill before or after ever had two who made so much noise in the world as the Duke of Buckingham and Oliver Cromwell.

MR. HUGHES, in his *Geography of British History* (Longmans), presents young persons with a running geographical comment upon the history of our country, which they are far more likely to digest if they take it as they need it, than if they are called upon to swallow it as a whole from a general manual of geography. Thus the Roman period brings up a list of British tribes and Roman cities, after which we get a list of Latin, Celtic, Saxon, and Scandinavian words entering into the geographical nomenclature of Britain. A sketch of the possessions of English kings on the continent, a series of topographical accounts of English battlefields, numerous details on the establishment of our colonies, lists of Parliamentary constituencies, etc., occur in their proper place, and need not be consulted till the pupil finds that he wants them in the course of his studies. The idea is a thoroughly good one. But it may be suggested that the account of battlefields might well be made to cover those which, like Bannockburn and Culloden, were at least fought on British, if not on English soil, if indeed Blenheim and Waterloo should not be included in the list, if illustration of British history is the object. A moment's thought, too, would convince Mr. Hughes that the title of a map of South Britain during the Saxon period, is delusive, and only serves to distract the attention from the considerable changes which took place during a period of some six centuries. Such a map ought always to refer to a distinct date. Indeed, the Saxon period, which affords the greatest scope for the explanations of the political geographer, is the weakest part of the book, as Mr. Hughes seems not to be aware of the results of Dr. Freeman's labours, or of the valuable maps with which his *History of the Norman Conquest* is illustrated. But in spite of these drawbacks, the book is one which may safely be commended to teachers of history.

EDITOR.

NOTES AND NEWS.

MR. SWINBURNE'S Essay on Chapman, originally written to preface a collected edition of that poet's works in three volumes, has grown under his hands, and now presents such dimensions that he proposes to publish it in a separate form, as a little volume uniform with his poems. The peculiar character of Chapman's mind has given the later poet an opportunity of dilating on gnomic poetry in general, from Theognis to Mr. Browning. The pages devoted to a study of the author of *Sordello* from a totally new standpoint will not be the least curious part of the forthcoming volume. Mr. Swinburne's alacrity in seizing any collateral thread that may give strength to his critical argument is so well known, that his admirers will not be surprised to learn that the essay sparkles with more wit and suggestion than the somewhat heavy object of it would give one reason to suppose. Among other things the poet announces, and with no uncertain sound, his opinion of the labours of the latest school of Shaksperian commentators. As soon as this book is out, and before Christmas, Mr. Swinburne will bring out a volume of *Critical Studies*, reprinted from the *Fortnightly Review*, and this may be followed by another set of essays. Meanwhile he is steadily working at his long-projected epic of *Tristram and Iseult*, which progresses somewhat rapidly. Mr. Swinburne has not yet begun even to plan the third part of his Scottish trilogy; nor is it probable that this will be touched for some time. It may be added that he is planning two more of his brilliant critical studies—one on Théophile de Viau, a French poet of the seventeenth century, known to English readers chiefly by a perversely-fantastic critique in Gautier's *Grotesques*; and the other on the author of the drama of *Joseph and his Brethren*, a writer than whom perhaps no one has ever been at the same time so gifted and so utterly obscure.

The new number of the *Fortnightly Review* contains a poem of Mr. Swinburne's which we cannot resist the temptation of quoting in full. We understand that it was sent to Mrs. Proctor on the night of October 14.

"IN MEMORY OF BARRY CORNWALL.

Monday, Oct. 5, 1874.

I.

"In the garden of death, where the singers whose names are deathless
One with another make music unheard of men,
Where the dead sweet roses fade not of lips long
breathless,
And the fair eyes shine that shall weep not or
change again:
Who comes now-crowned with the blossom of snow-
white years?
What music is this that the world of the dead men
hears?"

II.

"Beloved of men, whose words on our lips were honey,
Whose name in our ears and our fathers' ears was
sweet,
Like summer gone forth of the land his songs made
sunny:
To the beautiful veiled bright world where the glad
ghosts meet—
Child with father, and bridegroom with bride, and
anguish with rest,
No soul shall pass of a singer than this more blest.

III.

"Blest for the years' sweet sake that were filled and
brightened,
As a forest with birds, with the flowers and fruits of
his song;
For the souls' sake blest that heard, and their cares
were lightened;
For the hearts' sake blest that have fostered his
name so long:
By the living and dead lips blest that have loved his
name,
And clothed with their praise, and crowned with their
love for fame.

IV.

"Ah! fair and fragrant his fame as flowers that close not,
That shrink not by day for heat or for cold by night;
As a thought in the heart shall increase when the heart's self knows not,
Shall endure in our ears as a sound, in our eyes as a light;
Shall wax with the years that wane and the seasons' chime,
As a white rose thornless that grows in the garden of time.

V.

"The same year calls, and the one goes hence with another,
And men sit sad that were glad for their sweet song's sake;
The same year beckons, and younger, with elder brother,
Takes mutely the cup from his hand that we all shall take;
They pass ere the leaves be passed or the snows be come,
And the birds are loud, but the lips that outsang them dumb.

VI.

"Time takes them home that we loved, fair names and famous,
To the soft long sleep, to the broad sweet bosom of death;
But the flower of their souls he shall take not away to shame us,
Nor the lips lack song for ever that now lack breath:
For with us shall the music and perfume that die not dwell,
Though the dead to our dead bid welcome, and we farewell.

A. C. SWINBURNE.

Night of Oct. 14, 1874."

The exquisite reference to our double loss, to Sydney Dobell as well as to Barry Cornwall, is very characteristic of a poet who has always been the first to appreciate what is good in the least popular of his contemporaries.

MR. JOHN J. BOND, Assistant Keeper in Her Majesty's Record Office, has now nearly ready a new edition of his useful *Handy-Book for Verifying Dates*. In the appendix, which contains the greater portion of the new matter, will be noticed an explanation of the difference between the Roman reckoning of the Christian era, and that of the early Christians in the first and second centuries, with a quotation from Josephus which justifies the calculation of this era from the battle of Actium, so that the twenty-eighth year of Augustus should fall to the year of Rome 750, instead of 754 A.V.C. = 1 A.D. of the Roman reckoning, the earlier date being represented by 1 *Anno Christi* = 4 B.C. Special attention is also drawn to the erroneous system by which the *annus verus*, or 4 B.C., was called by ecclesiastical writers 3 B.C., by the omission of 1 B.C. marked "o"; and a table of the years of the Christian era, with corresponding dates, will be found of great service in placing in a clear light this complicated point in chronology. Another new feature in this edition will be the Tables of Regnal Years of the Sovereigns of England, which appear in an improved and more condensed form. Other new tables have been added, making this work of the utmost value to those engaged in historical researches.

THE Rev. D. Silvan Evans has in the press a volume of the miscellaneous writings, in prose and verse, of the Rev. Evan Evans, known among his countrymen as Ieuan Brydydd Hir, author of the *Dissertatio de Bardis* (1764), who died in 1789. Evan Evans, a friend and correspondent of Bishop Percy, ranked high in his day as a critic and antiquary, and devoted many years to the collection and transcription of Welsh manuscripts. He also wrote several poems, and some of them, especially those written in his vernacular Welsh, possess very considerable merit. His "Love of

our Country," which appeared anonymously in 1772, and is now extremely scarce, will be reprinted in this collection. His letters, about fifty of which will now appear for the first time, throw considerable light on the state of Welsh literature, and on the way that ecclesiastical affairs were managed, or rather mismanaged, in the Principality in the latter half of the last century. The publisher is Mr. H. Humphreys, Carnarvon.

MESSRS. LIPPINCOTT, of Philadelphia, have published a handsome edition of Miss Amelia B. Edwards's recent work on the Dolomites, entitled *Untrodden Peaks and Unfrequented Valleys*, with reproductions of the original illustrations. The book has for several months been in circulation in the Tauchnitz collection.

MR. GARDNER, of Paisley, has in the press the Poems of Allan Ramsay, based on Chalmers's edition of 1800, with an Essay on the Genius of Ramsay, by Lord Woodhouselee; and the Verse and Miscellaneous Prose Works of Alexander Wilson, the American ornithologist, with Memorial-Introduction, notes, &c., by the Rev. A. B. Grosart. He has also in preparation a new and complete edition of Burns, and a new edition of the poems of Robert Tannahill, containing an unpublished song, letters, and new information regarding the poet and the subjects of his songs and poems.

MESSRS. TURBS AND BROOK, of Market Street, Manchester, have in the press, and will publish in December next, the mezzotinto engravings from the works of Henry Liverseege, the eminent Manchester artist. They will be printed from the original steel plates, which will then be immediately destroyed. Mr. George Richardson, author of *Reminiscences of Liverseege*, contributes a memoir, descriptive letterpress of each plate, and notes. The price of the work will be two guineas.

DR. C. M. INGLEBY has just finished his preface to his *Centurie of Prayse* (of Shakspeare), and has entered up in it the latest corrections of his views (as that by Mr. R. Simpson in our columns a week or two since), and the latest additions to them, as that of Professor Dowden's discovery (see ACADEMY, October 24, p. 454) of the borrowings from Shakspeare's *Rape of Lucrece* in the "Lucrecia" in George Rivers's *Heroines*, 1630. Dr. Ingleby's *Still Lion*, an attempt to establish a sound system of interpretation and criticism of Shakspeare's text, is also nearly ready.

PROFESSOR RUSKIN is lecturing twice a week at Oxford now to audiences of 600, as many as the room will hold. His volunteer diggers still go on with their road-making under his superintendence.

MR. MORFILL will add to his Essex Ballads for the Ballad Society a curious poem from the Additional MS. 15,226 in the British Museum, entitled "The Disparaging Complaints of Wretched Rawleighe for his Treacheries against the worthie Essex." It professes to contain Raleigh's confession of the underhand means by which he and his friends wrought Essex's fall. Some other unpublished ballads on Frobisher and Warwick will be printed from MSS. at Oxford, in Mr. Morfill's volume.

THE Roxburghe Club is having a facsimile made of a very fine illuminated manuscript Anglo-Saxon Apocalypse at Oxford. Baron Heath is printing, as his present to the club, a poem on Queen Mary.

It is reported that Mr. Henry Huth is printing for private circulation another of those volumes of choice old rarities with which he from time to time enriches the libraries of his book-loving friends.

THE following remarks quoted from our contemporary the *Revue Bibliographique Universelle*,

of Paris, are interesting on other as well as on moral grounds:—

"*La Revue scientifique* publie souvent des traductions de l'anglais, et, pour leur donner plus d'autorité aux yeux de ses lecteurs, elle le fait sans mentionner que ce sont des traductions et sans dire d'où ces travaux sont pris, et met simplement au bas le nom des auteurs. On pourrait croire que ceux-ci écrivent spécialement pour elle, n'étaient parfois de grosses erreurs de traduction. Dans le n° du 19 septembre dernier, elle a publié le discours prononcé par M. Tyndall au congrès de Belfast (Association britannique pour l'avancement des sciences), et qui venait de paraître dans l'*Academy* de Londres. Or, il y est question (p. 274, col. 2, ligne 3) du Dr. Wells 'le fondateur de la théorie actuelle de Dew (???)'. Aucune note n'explique ce que c'est que la *théorie de Dew*. Mais le lecteur qui sait l'anglais reconnaît dans *Dew* le mot qui signifie 'la rosée': il s'agit de 'notre théorie actuelle de la rosée.' On sait que les Anglais ont l'usage d'écrire avec des majuscules les mots sur lesquels ils désirent appeler l'attention. Le traducteur anonyme l'ignorait sans doute; mais comment une phrase aussi dénuée de sens peut-elle passer dans les colonnes d'un recueil qui s'intitule *Revue scientifique de la France et de l'étranger*? — Dans l'article de la *Revue scientifique* où se trouve le contre-sens du mot *Dew*, l'*Histoire du MATÉRIALISME* de l'Allemand Lange, est transformée en *histoire du MACHIAVÉLISME*."

At the festival in honour of the memory of Esias Tegnér held at Lund on October 4, the Danish poet Carl Ploug delivered an important speech, in which he dwelt upon the new light thrown on the views of the great Swedish skald in regard to social ethics and religion by the newly discovered and recently published volume of correspondence. Ploug continued by pointing out that Tegnér and Ohlenschläger stood side by side as the representative men of Scandinavia in all matters of intellectual distinction, and expressed, with much warmth and grace, a hope that the present condition of introspection and culture might in the end prove to have been as useful to the national life as the creative vigour of the last generation had been.

Nær og Fjern for October 11 gives a very bright sketch of the personality of the Danish poet Ludvig Bødtker, whose death we announced a fortnight ago. It seems that there was a delicate tragic idyll of love in the poet's early life, of which nobody knew anything till his papers were examined. After the death of this unknown maiden, Bødtker lived for art and for his friends. A touching picture is drawn of the gladness the old man felt in his life up to the last. He was eighty-one last March; on his birthday friends clustered round, expressing their wish that he might enjoy many happy returns of the day. "Well, I really hope I may!" said the sanguine and sunny old poet. We are glad to see that a biography of Bødtker is announced as in course of preparation.

WE have received from Messrs. Chatto and Windus a letter respecting Colonel Chester's article on the *Original Lists of Emigrants to America*, published by them. With respect to their claim to have given a literal transcript of the original, and to have reproduced "every letter, every contraction, every dot," we refer our readers to Mr. Sainsbury's letter in our correspondence. Colonel Chester having stated that Mr. Drake's *Researches among the British Archives* "contains within the compass of about a hundred convenient pages all that is in the more elaborate work before us which relates to the early settlers of New England, and most, if not all, of the list of emigrants to Virginia and the West India Islands," Messrs. Chatto and Windus urge that Mr. Hotten's book contains over seventy pages more matter relating to New England than Mr. Drake's, and nearly a hundred pages more relating to Virginia and the English West Indian colonies.

They also state that with respect to the accuracy of the transcripts, they take Mr. Hotten's responsibilities upon themselves, though they had

no further hand in the matter than issuing the sheets which were printed before his death. They think it "highly probable, that notwithstanding the care that has been taken, errors have crept in, but that they are at least innocent of the charge of attempting to beguile the American public with a reprint of Mr. Drake's book."

A CORRESPONDENT points out that at page 455 we were made to ascribe to the Hunterian Club the intention of reprinting "the whole works of Samuel Lodge." Samuel was of course a misprint for Thomas.

AFTER all, there is something to be said for the system that made Burns an exciseman: if, as was not impossible, he had outlived his genius as he outlived his vogue, he would still have been independent. Mr. Thomas Miller, who is just dead, survived his talent and his vogue completely, and it comes back on us as a surprise that he was taken up by the *Literary Gazette* and the Countess of Blessington, and wrote many prose idylls of which it is possible to speak kindly, and much poetry of which those who read it when young think fondly, though *Gileon Giles*, his best novel, is still to be seen on railway bookstalls.

The *Shotover Papers*, to judge by the eighth number, are not the best of the ephemeral magazines which are always coming out at universities; the writers have plenty of outrageous animal spirits, and most of them have little more; but "Human Physiology," by Friar Tuck, is really amusing. Here is a specimen:—

"The use of the Ear is more obvious: it serves as a refuge for one of the genus Hemiptera, and grows to a considerable length in a race closely allied to man."

"A Letter of Junius in the possession of Friar Tuck" is like the laboured invective of the original, but less exciting as less serious.

ACCORDING to the *Index*, Mr. John Anderson, the founder of the Natural History School at Penikese, has sent a draft worth 1,000 dollars in gold to Garibaldi, with a promise to repeat it annually.

THE first critical articles by Sainte-Beuve have just appeared, it is announced, under the title *Premiers Lundis*. The volume contains the first article that Sainte-Beuve ever wrote on Victor Hugo. It is a review of *Odes et Ballades*, and it is remarked that with his rare critical sagacity he knew, even then, where to place his finger on one of the weak points in Hugo's writings. "Nulle gradation des couleurs," he says, "nulle science des lointains. Le pli d'un manteau tient autant de place que la plus noble pensée."

THE seventeenth Congress of the Breton Association was opened at Vannes on August 30 last. Among the most important papers, as we learn from *Polybiblion*, were those by M. Le Men, deciphering a milestone which identifies the ancient Vorgium with Carhaix; by M. Kerviler, suggesting a plan for a Breton bibliography; by M. l'Abbé Chautillier, on a painted wooden coffer of the twelfth century found in the archives of the chapter of Vannes; by M. Ropart, on the banishment of the Parliament of Brittany to Vannes from 1675 to 1693; by M. de la Borderie, on the Duchess Anne of Brittany; by M. Luzel, on Breton popular tales, &c. The Congress devoted several sittings to the examination of the magnificent Celtic collections of the Museum of Vannes and of the prehistoric museum of the Comte de Limur, and, after two excursions to the numerous megalithic monuments of the Gulf of Morbihan and the neighbourhood of Carnac, decided to hold its next meeting at Guingamp, on September 6, 1875.

Polybiblion states that a copy of the Peschito version of the Old Testament, dating from the sixth century, preserved among the Syriac MSS. of the Ambrosian Library at Milan, is to be reproduced by photography, under the direction of the chief librarian, Dr. A. Ceriani.

CANON FRIND, of Prague, has published a curious MS., entitled *Scriptum super apocalypsin cum imaginibus*. It was written in the thirteenth century by a German Franciscan, but the drawings are of the fourteenth century.

THE *Bulletin du Bibliophile* announces that M. Charles Nisard has discovered in the public library of Parma about 200 letters addressed to Father Paciandi, a learned monk of Parma, 152 of which are from the Comte de Caylus, and 48 from the Abbé Barthélemy. Most of the letters are of considerable length, and relate to antiquities, the news of Paris, the expulsion of the Jesuits from France and Portugal, literary news, especially bearing on the writings of the Encyclopædists, the Jesuits, &c. M. Nisard has obtained leave to copy this correspondence, and proposes to publish it with notes and explanations. No letter of the Comte de Caylus was previously known.

The *Revista de España* begins its fortieth volume with an excellent number. We have the commencement of an historical parallel between Cortes and Lord Clive, and the continuation of a study of the monarchy of 1830 and of other papers; but that which will have most interest for English readers is an article by the Vizconde del Ponton on the House of Lords. The keynote is struck in the opening sentence, which asserts that "the institution which gives a special and original character to the government of Great Britain, and which makes it superior to those of other countries is without doubt the House of Lords." The English aristocracy, at the close of the fifteenth, and during the sixteenth century, was less important and less powerful than those of the Continental States, and could not be compared with the French, and still less with the Spanish. The author's historical sketch does not bring out very clearly the causes to which he attributes the indisputable superiority of our second chamber. He lays stress upon the custom of primogeniture as a guarantee of the territorial influence of the hereditary peers, and upon the gradual but continuous process by which new blood is infused into the aristocratic body. The rich propertied class can oppose the excesses of a government without danger, and with a success impossible to small proprietors or labourers.

The author is perhaps much disposed to see things in only a rose-coloured light; yet it is certain that, notwithstanding occasional friction, we have—by historical accident, as it were—stumbled upon a form of a second chamber which has proved more successful in its working than others which can boast of a more logical method of construction. The House of Lords is at all times an assembly of notables, from the succession of distinguished statesmen, lawyers, and soldiers who are added to it, and the leaven of commonplace which an hereditary chamber must always possess may serve the purpose of ballast, and steady the more precious cargo of the ship.

PERHAPS a short glance at the doings of the Masonic craft a hundred and fifty years back may have some little interest just now. We give here a few jottings on the subject which have been gathered from an unprinted volume of news-letters of about that date:—

"24 January, 1720-30. A Lodge of the antient and honourable Society of free and accepted masons was held last night at y^e Horn Tavern in Westminster, where were present y^e Duke of Kingstone, Grand Master, Thomas Blackerlie, Esq^r, Deputy-Master, Duke of Richmond, Earl of Sunderland, Lord Inchequin, and many more Lords and Gentlemen, and 5 Masons were made, viz: the Earl of Portmore, Stephen Fox, and Roger Holland, Esq^r, Members of Parliament, the hon^{ble} Mr. Forbes, and Mr. Martin, author of y^e Tragedy of Timoleon, which will be published next Monday; Dr. Desaguliers officiated part of the Ceremonies on this occasion.

"7 Feb^r. A Lodge of free and accepted masons was held last night at the Horn Tavern Westminster the Duke of Richmond presiding as Master of the said

Lodge when the Duke of Grafton was admitted and sworn as member of that ancient and hon^{ble} Society. The Duke of Norfolk Grand Master and the rest of the Society have taken up the whole Pitt and Boxes of the Theatre in Drury Lane for next Thursday, when the play of King Henry the 4th, whose son was a Free Mason, is to be acted and all the members are to appear in white gloves and white leather aprons.

"30 August. We hear some gentlemen lately returned from France amongst other things say y^e his most Christian Ma^{ty} has been made a free mason in y^e usual forms by the Duke of Norfolk Grand Master of y^e Company and y^e his Ma^{ty} hardly ever shewed himself more merry than he was at this peice of ceremony."

ON Saturday night, October 10, died Hans Heinrich Vögeli, Professor of History in the University of Zürich, at the age of sixty-two, after a long illness. Modern Swiss historical literature loses in him a pre-eminent representative, and Switzerland one of her truest and most characteristic sons. He had completed his *Schweizerische Chronik* for the year 1873, the transition year from the Bund of 1848 to the revised Bund of 1874. The book is something like our *Annual Register*, a chronological capitulation of all that has been done in Switzerland in political and social life during the year; but as it is the work of an historical scholar, and not of a mere compiler, it gives predominant attention to the "culture-history" of the period. First a citizen, and afterwards a professor of history, he regarded modern Swiss politics as the continuation and explanation of the old Swiss struggles toward a national life.

M. A. GEFFROY, in the *Revue des Deux Mondes* (October 15), reviews a publication of M. A. de Boislisle, documents bearing on the history of the Chambre des Comptes of Paris through the sixteenth, seventeenth, and eighteenth centuries, among which are some interesting autographs of Henry IV. M. Geffroy welcomes the work not only on account of its learning, but also on that of its political *apropos*, showing, by the inability of a most respectable magistracy appointed by the Crown to control its political action, that Parliamentary government cannot dispense with a representative element, and cannot be said to have failed in France in the period when it was nominally maintained without that element. M. Marc Monnier devotes a very readable paper to an adventurer of the last century, Count Giuseppe Gorani, an Italian *intrigant* and author, who might be classed personally with, and between such men as Gentz and Beaumarchais, though both his ability and his extravagance were on as much smaller a scale as his notoriety. He was born at Milan in 1740, and died, quite forgotten, at Geneva in 1819; his manuscript memoirs have lately been discovered by a gentleman of that city, and upon them M. Monnier's notice is based. His life was spent in a series of romantic schemes of great adventures, which were thrown aside at the first and slightest obstacle, and in more successful but equally unsustained diplomatic work of the less avowable kind for nearly all the courts of Europe. At one time he thought of supplanting Paoli, and forming a Corsican kingdom, to include Genoa, and went to Turkey to borrow funds for the enterprise; his sister was married to an old man, the last of the Comneni, and on the strength of that relationship Voltaire proposed that he should be employed by the Empress Catherine of Russia to raise the Greeks against the Turks. His last appearance on the political stage was in France during the Revolution; the Convention gave him letters of naturalisation, and he narrowly escaped sharing the fate of his friends the Girondins, whose opinions, however, were too republican for his taste. He was intimate with Mirabeau, for whom his admiration was unbounded. His account of the insurrection of August 10 will be worth the attention of future historians. It is in character that he explains the end of the Girondists by

their failure to take his advice on that occasion, which was to forestall their enemies in the use of revolutionary methods and execute the leading Jacobins. M. Maury is entertaining upon the science of seals and the light thrown by them upon the history of costume, architecture, and the genealogy of private families, though he hardly makes good his claim to establish "Sigillography" as a study of serious independent interest.

NOTES OF TRAVEL.

LETTERS have been received from the African traveller, Dr. Nachtigal, dated Chartram, August 19, which announce that he had arrived in good health at El Obeid, Kordofan, and would continue his travels in accordance with the plan previously settled upon.

PROFESSOR A. BASTIAN, President of the African Exploration Company at Berlin, has addressed a circular to Herr Adolf Koch, Professor of Natural History at the Higher Normal School at Vienna, and geologist to the Imperial School of Mines, inviting him in the name of the Association to take the superintendence of an exploring expedition which they are preparing to send into the equatorial regions of Africa. As yet it is not known whether Professor Koch will accept the mission proposed to him.

ON October 7 the quaintly-named Société d'Emulation of the Jura (or, as its German-speaking members call it, the Jurassische Gemeinnützige Gesellschaft) held its annual meeting at Dachselden, *alias* Tavannes. I see that in the fine folio *Beschreibung der Eydgnosschaft* of 1642 this village is called Tachsfelden. The old bishopric of Basel, the seat of the operations of this society, has long been a borderland of race, language, and religion. The beautiful valley of the Münsterthal, the French Val Montier, in the dominions of this bishopric, was used by the Romans as their passage road from Aventicum to Augusta Rauracorum, Avanches to Basel, and the first bishops called themselves, from the people, Episcopi Rauracenses. Our Bishop Burnet seems to have passed this route from Avanches to Basel in 1686, according to his letters to Robert Boyle, although he makes no mention of the famous Pierre Pertuis with its Roman inscription. Every place has still its German and its French name, and from the Reformation until the absorption of the bishopric into the Canton of Bern, the bishop ruled a great number of Protestants as secular prince, while he ruled the majority of his subjects both as religious and secular master. The district is now a centre of great interest from the fact of its being the chief seat of the contest between Church and State, or rather between Pope and State, in Switzerland. Perhaps no corner of the world could be found in which there are more contradictory elements at work. The sharp division of the Bernese Jura into Liberal and Ultramontane, and the division of the Catholic population into Swiss and Roman, may possibly account in great part for the comparatively small attendance of the members of the society at its late anniversary. Out of some two hundred, forty-one honorary and seventy-one corresponding members, only thirty were present. No fights have taken place within the arena of this literary society, however, and its more sanguine members believe that the completion of the Jurabahn will bring its isolated members in greater numbers to its meetings. At present, the diligence from Basel to Biel, which English travellers will find a most pleasant way of entering into the heart of Switzerland—is the means of communication along a road of sixty miles studded with interesting places. Regierungsrath Bodenheimer, in his address, urged the members of the Society, as pioneers of progress in their district, to make use of the altered conditions of their situation by the formation of the railway, and do something to deserve their name of emu-

lators. Papers were read on "The History of Tramelan from the Earliest Times;" on "The Troubles of 1740;" on "Gobet, the Young Poet of Neuchâtel," and other matters of local interest. There was also a discussion on the relics of the reindeer period, and of the prehistoric dwelling-places in the Laufenthal, and at Bellerive on the Bois. A fair account of the route from Basel to Biel through the valleys of Laufen and Münster, with a painstaking and conscientious sketch of the double relation of the bishopric of Basel to the Holy Roman Empire and the Swiss Confederacy, was written by our countryman Archdeacon Coxé, the successor of Herbert and Norris at Bemerton, near the end of the last century. He knew that he was on the confines of the Roman Helvetia, but had no conception that he was passing amidst prehistoric remains.

THE inhabitants of the extreme north of Norway, that is to say, of East Finmark, and especially of the shores of the Varanger Fjord, have been so loud and bitter in their complaints that the newly instituted whale-fishery of that coast was destroying their natural means of subsistence, the cod-fishery, that the Norwegian Government has sent Professor G. O. Sars up to the district in question to look into the facts. The chief complaint was that the capelan (*Mallotus arcticus*), unless they were driven into shore as food by the whales, kept out in the deep seas, and that the cod were so sensitive to impurity, that the least suspicion of blood or fatty substance on the water drove them to a distance. According to *Morgenbladet*, Professor Sars has made a report which does not bear out these sensational surmises. He has spent the whole summer in the district, chiefly at Vadsö, the centre of the trade of East Finmark, and almost every day he has been able to examine the bodies of freshly-harpooned whales. He finds these to be almost without exception blue whales (*Balaenoptera Sibbaldii*), a species that is perfectly innocent of hunting capelan as food. Sars finds scarcely anything in the stomachs of these temperate monsters but the remains of a tiny crustacean, *Thysanopoda inermis*. The failure of the cod fishery seems, therefore, to have no connexion whatever with the massacre of whales.

THE Paris Geographical Society held its first meeting since the recess on the 21st instant, at its old quarters in the Rue Christine. The paper of the evening was read by Dr. Hamy, on the presence of Polynesian races in Melanesia, and more particularly New Guinea. A large number of new members is announced, which accession of strength has raised the total number to more than eleven hundred.

FROM a scientific journal published in Canada we gather the ensuing information respecting Labrador. Although in the same latitude as the British Isles, it is one of the bleakest and most unproductive regions on the face of the earth. Snow usually falls from September to June, and during winter the coast is completely beset with the ice which flows down from Baffin's Bay, while in summer icebergs are frequently driven on the rocks inshore. Storms often burst over this lone region, which few would ever visit were it not for the productive fisheries of cod, seal, and herrings which exist off the shores. The total length of the country is about 700 miles, and its breadth 480. The interior consists of a plateau about 2,240 feet above the sea, and Professor Hind found it almost bereft of vegetation. A species of moss called *caribou* grows pretty plentifully, however, and in sheltered nooks and ravines firs and aspens are to be found. The universal desolation which, Hind says, words fail to express, is rendered almost more striking by the great distance between the score or so of Hudson Bay forts, which form the only civilised abodes throughout the region.

THE Messageries Maritimes steamers run twice as frequently now to Brazil and La Plata as they did in 1872, and during 1873 a new line of com-

munication by their agency was established between Marseilles and London, and many trips were made between Marseilles and Constantinople (*via* Salonika) on the one hand and Barcelona on the other. The increased mileage of communication by these steamers in 1873 was about 18 per cent. over that of 1872.

THE *Débats* announces the death of M. Léger de Libessart, ex Consul-General in Bolivia, who had resided in South America for the last fifteen years. He contributed to several journals under the *nom de plume* of Ramon Lopez, and made it his great object to open up the boundless resources of South America to the Old World. He was the originator of the plan of preserving meat, afterwards adopted by Liebig and numerous others, which has been the foundation of a great trade in Australia and Brazil, the idea being suggested by the enormous waste of food at the slaughter-houses at Barracas, near Buenos Ayres, where a great number of oxen were slaughtered every morning for their hides alone, and the flesh and bones burnt or left to form vast heaps of offal, which were bought up by English speculators as a substitute for guano. M. Libessart was also the first to conceive the idea of joining Europe and America by a telegraph across Siberia, Behring Straits, and the Aleutian Islands.

DR. VON DÜCKER's supposed discovery of a kitchen midden on the island of St. George, near Athens, has been shown by M. Gaillardot, the French physician of Alexandria, to be the remains of an ancient manufactory of Tyrian dyes. Similar deposits have been found by Dr. Gaillardot on the island of Cerigo, as well as near the site of ancient Sidon, the present Saïda, where about sixty feet above the sea lies a mussel-bank extending nearly 400 feet in length. The entire mass is composed entirely of the remains of *Murex trunculus*, but a few paces off, and all along the rocks encircling the town, various other species, as *M. brandaris*, and *Purpura haemostoma*, may be found in large numbers. The former of these is known to have yielded the most precious colouring matter used in the preparation of the renowned dye, but it is conjectured that several other species were used to produce the various other shades of colour, such as reds and yellows shot with black, which the Tyrian dyers employed, in addition to the violets and reddish purple tints for which they were most renowned. Dr. von Dücker has found on the island of St. George smooth round stones, which he supposes were used in the place of hammers to open the valves.

NORFOLK AND NORWICH ARCHAEOLOGICAL SOCIETY.

THE autumn excursion of this Society was held on Friday, October 23, near Ashill, and the members had the opportunity of seeing some Roman remains recently discovered in the railway cutting near the village. The line runs by the remains of a large Roman camp at Ovington, of which an account is given in *Archaeologia*, vol. xxiii.; and at the spot which was visited on Friday last three wells were discovered, the mouths of which were fitted with solid oak frames. One of these was excavated in the presence of T. Barton, Esq., a member of the Society, to the depth of forty feet. The first find was a small bronze fibula, some Samian ware, broken pottery, stones, charcoal, a basket, a strainer, and bones of cattle and birds. The Samian ware consisted of paterae and drinking cups, and some of the makers' names inscribed on the fragments were hitherto unknown. At a depth of ten feet there were found a knife with a portion of the wooden handle, which had been fastened by a socket and nail; a whetstone and some wall plaster, with an ordinary Roman pattern. Lower down, the contents chiefly consisted of layers of urns, about a hundred in number, of which fifty are nearly perfect, and most of them of great beauty. They had been care-

fully let down into the hole, some enclosed in baskets, and the urns in each layer were found arranged in different ways. At the lowest level several of the urns had still attached to them the remains of the cord with which they were let down into position. Although the earth in the urns consisted merely of chalk, with a little alumina and iron, but no traces of phosphate of lime or bone earth, the opinion of the archaeologists present was that the pits must have been used for sepulchral purposes, at least originally, and afterwards hastily filled in with rubbish, as the higher strata were of a very miscellaneous character, including parts of four worn-out sandals, bones of deer and other animals, oyster and mussel-shells, &c. Among the urns were found various other articles—such as a harp-shaped fibula partly plated with gold, an iron implement slightly resembling a strigil, the neck of an amphora, a bucket with iron handle and cleats, a quern stone broken, a muller for grinding paint, a stag-horn handle, a clam shell, a quantity of hazel nuts, and branches, and other things.

Another of the wells was excavated in the presence of the assembled company. At a few feet from the surface two elegant vases were found; but as nothing was discovered for six feet further, except the oak lining of the well, the work was not continued, and the hole was filled up.

It is understood that the directors of the railway company intend to present some of the urns to the museums at Ely and other towns in the neighbourhood.

LITERARY PROSPECTS IN FRANCE.

THE continuation of M. Guizot's *History of France* is only in existence as far as the conclusion of the fourth volume, which completes the reign of Louis XIV. The concluding volume, if it ever appears, will be the work of M^{me}. de Witt, though it will be based on notes taken by the children and grandchildren of the historian from the lectures which he used to deliver to them. Besides the continuation of the *History of France*, M. Guizot has left no other manuscript intended for publication. His family will doubtless be able to extract from his private papers and correspondence many things of great interest, but we must not look for any important posthumous work, any happy surprise like the publication of M. Villemain's *Gregory VII.*

The keenest curiosity is felt as to M. Taine's forthcoming work on the French Revolution. We are promised no new history of that epoch, so often studied, but in despite of all still so imperfectly known. M. Taine's book will be a history of public feeling in France during and after the Revolution. In the first volume he will study its moral and historical causes; in the two following he will analyse the ideas, the tendencies, the passions which animated men and multitudes during the Revolution; and the last volume will set forth the consequences of the Revolution, and its influence on the moral, intellectual and political condition of modern France. All the materials for this important work are in readiness. The author has the substance of more than twenty folio volumes of unpublished documents preserved in the Archives of Paris, of which every part, including those from which the public is generally excluded, has been generously thrown open to him. In his retirement near Annecy, M. Taine is wholly occupied in arranging his materials, and his first volume will probably appear this coming winter. We were enabled to form an idea of the character of this work by two lectures given by M. Taine last spring at the École des Sciences Politiques, in which he sketched the state of France under the old régime. He showed with rare impartiality and that brilliancy of colouring which is peculiarly his own, the services rendered to ancient France by the monarchy, clergy, and nobility, the virtues which they preserved even in the eighteenth century, as well as the vices which they had contracted imperceptibly, and the evils

with which they overwhelmed the non-privileged classes. It has been said that M. Taine's work is written in a spirit of blind reaction against the Revolution. These two lectures were enough to show the injustice of the accusation. Undoubtedly the author's tendency will bear the stamp of pessimism with regard to the future, of profound gloom with regard to the present, and of but little sympathy for the historical development which has been the outcome of the Revolution; but he is very far from entertaining toward the old régime those feelings of passionate regret which only a combination of religious and monarchical illusions can produce. He will remain faithful to his habits of scientific impartiality.

M. Taine's book will doubtless be the most important literary event of the winter, for the fifth volume of Renan's *Origines du Christianisme* is not near publication. Some historical works of interest are however promised us. M. Fustel de Coulanges, the author of *The Ancient City*, will give us two volumes on the Origin of the Feudal System, the first of which will appear very shortly. Two chapters have already been published in the *Revue des Deux Mondes*, and give an idea of what the complete work will be. M. Fustel de Coulanges is an original thinker, with a great power of synthesis, and his style is full of force and colour. His historical pictures have the beauty of mathematical deductions. But he has the defect of being systematic to excess, of wishing to force upon history a regularity and symmetry which are foreign to it, and above all of working exclusively at the original sources without paying any attention to the works of previous writers. Consequently he often puts forward views long since refuted, or takes infinite pains to discover things already known. I fear that this disposition to neglect second-hand works may prove injurious to his book on the Origin of the Feudal System, a problem which has already, especially in Germany, been the subject of so many profound researches.

While M. Fustel is thus voluntarily entrenching himself in his own works, and closing his eyes to all that has been done before him and beside him, other historians think that it concerns France above all to know foreign countries, to study them profoundly in their historical past as well as in their political and social present. Germany naturally gets the first share of attention. M. E. Véron, who some years since published a *History of Prussia from Frederic II. to the battle of Sadowna*, has just produced the sequel of this work in a volume entitled *History of Prussia from the Battle of Sadowna*. Despite his very natural aversion to Bismarck's work, M. Véron is a cultivated and philosophical thinker, striving after impartiality, and labouring to discover the hidden reasons and psychological causes of events. His book is the result of honest study, and draws its inspiration from a high level of thought. M. Zeller is to give us the third volume of his *History of Germany*, which will comprise the period of the Houses of Franconia and Swabia; and a *History of the Geographical Formation of Germany* is advertised from the pen of M. Himly. Lastly, a young writer who has already made himself known by some remarkable articles on Germany in the *Revue des Deux Mondes*, has studied the most remote origin of Prussia, and has presented to the Paris Faculty of Letters an essay on the Origin of the Margravate of Brandenburg. MM. Rambaud and Leger, who have made the Slavonic nations their special study, were both present at the Archaeological Congress of Kiev, and have doubtless brought back materials for new works on Russia. Hungary also, hitherto neglected by French scholars, has found her historian in M. Savours, the author of an excellent book on the political literature of Hungary from 1789 to 1815. He is now just finishing the first volume of a general history of Hungary. G. MONOD.

CORRESPONDENCE.

THE ORIGINAL LISTS OF THE EMIGRANTS TO AMERICA IN THE SEVENTEENTH CENTURY.

Record Office: Oct. 28.

I think your reviewer has done good service in pointing out what has already been printed of these *Original Lists* by Mr. Samuel Gardner Drake, though he does not seem to know that the *Lists of the Living and Dead in Virginia* have likewise been printed before in Virginia. Will you allow me to supplement what your reviewer has said of Mr. Hotten's book with a few remarks? And first as to the accuracy of the reading of the names. Your reviewer says "the question of accuracy is fairly raised" (as between Mr. Drake and Mr. Hotten), "because the discrepancies are numerous and often very important." On this point I am able to speak with some authority, for I have examined the variations quoted by your reviewer, and find that in every instance the "fatal misreadings" he refers to have been on the part of Mr. Drake. It is true Mr. Drake had not the opportunity of examining in America his proof sheets with the original documents, but this I happen to know was done with every proof sheet of Mr. Hotten's volume before it was sent to press. The chief value of the book is, I think, the accuracy with which the names have been

transcribed and printed; and this I am told is the work of Mr. A. T. Watson, whose care and intelligence are greatly to be commended. On the other hand, let me point out the utter want of method in the arrangement of the materials dealt with—a serious fault in a book of reference of this kind—and the insertion of so much matter not connected with the professed object of the book as set forth in the title. Neither chronology, history, nor anything else is studied in the compilation of this volume; it is a jumble of all kinds of documents without any arrangement whatever, and therefore, as a book of reference, which it is intended to be, most unsatisfactory. Then as to the extraneous matter: What has a baptism in Barbadoes to do with emigration from Great Britain to the American plantations? or how can an appointment of provost-marshal of Jamaica affect the population of America, unless, by the way, he had power to send prisoners thither?

But these are not the worst features in this spoilt-in-the-editing volume, for there are important omissions of "Original Lists." Two examples will be sufficient to prove this assertion. At p. 112 (No. 78) of the Printed Colonial Calendar of State Papers, 1574-1660, is the following entry: "Names of the principal Undertakers for the plantation of the Massachusetts Bay that are themselves gone over with their wives and children." And yet this list, perhaps one of the most valuable on record for the history of New England, is omitted in Mr. Hotten's volume, although, singularly enough, he asks in his Preface (xxxi.), "Where are the lists of the *Arabella* and other ships in which John Winthrop and the founders of Massachusetts embarked?" Again, I do not find in Mr. Hotten's volume a List of fifty-three passengers, besides women and female children, who left Southampton for New England about April 6, 1635, in the *James* of London, of 300 tons, William Cooper, master, although it is entered at p. 209 (No. 67) of the said Colonial Calendar. True it is stated in the Preface that "it must not be imagined that the following pages furnish by any means a complete list of the early settlers in America," though I do not think the title leads us to this conclusion. Why are some of these "Original Lists" printed from the Colonial Calendar, and not all of them? If Mr. Drake's work "first suggested the desirability of making a systematic collection of authentic documents relating to the early settlers in America" (xviii.), I do not think Mr. Hotten's work has succeeded in attaining this satisfactory result. I must add, that with the exception of the entries from the Patent Rolls (155-168), there is not a single reference to the original documents, the want of which will be exceedingly inconvenient to those unacquainted with the contents of the Public Record Office. It must, I think, be evident to the least experienced that the plan of this publication has been altered more than once, and that the intentions of the original editor—supposing he had any—have been entirely misunderstood by his successors.

W. N. SAINSBURY,
Editor of the *Colonial Calendar of State Papers*.

DR. WEYMOUTH ON EARLY ENGLISH PRONUNCIATION.

Mill Hill School: October 26, 1874.

I think I have a right to complain of Mr. Sweet's reviewing my book without quoting the full title. Had the work been properly announced in the heading to his article, as it is described on its own title-page, as "In Opposition to the Views maintained by Mr. A. J. Ellis in his work on *Early English* . . . &c.," the reader would have seen at a glance the absurdity—I can find no milder term—of the charge that I had "approached the investigation with a ready-made *à priori* theory." As if it was likely that I should attack Mr. Ellis's book without having any definite views of my

own, especially when, as I have stated in the opening sentence of the book, I had (even in 1870) "had the subject for some years before my mind!" Indeed, when my old friend and school-fellow, the Rev. John Earle, was still Professor of Anglo-Saxon at Oxford—I do not remember how many years ago—I corresponded with him on this subject.

Besides, if the nature and aim of my essay had been distinctly set forth by a title correctly given, it would have been obvious to an intelligent reader that it was the reviewer's duty to consider exactly how far the assault on Mr. Ellis's position proved it to be, or not to be, impregnable.

Mr. Sweet admits that I "in some important cases really seem to have convicted Mr. Ellis of error." Thus I have pointed out the hitherto unobserved fact that no more in Chaucer's time than now was *here* sounded like *there*, *eke* like *breke* (= break), *succede* like *brede* (= bread); and no more in Chaucer's time than now would *do* rhyme with *go*, *sothe* (= sooth) with *bothe*, *some* (= soon) with *alone*, *rote* (= root) with *throte*, &c., notwithstanding the similarity of spelling. Yet Mr. Ellis, misled by the orthography, confounds the two classes of *e* words, and confounds the two classes of *o* words—"fatally for his whole theory," as I contend. Surely the reviewer should have seen that here lay the main gist of my impeachment of Mr. Ellis's scheme, and should, therefore, have bestowed special pains on the consideration—as this was a controversial work under review—whether these flaws are or are not of so grave, so fatal, a character as I attribute to them.

But no reader of Mr. Sweet's writings can be surprised that he prefers to expend his strength chiefly in remarks on the *tendency*-theory in which he is so devout a believer. I too believe (as I have explicitly stated) in change in spoken language, and change no doubt according to certain laws as yet imperfectly understood; but the question is one of rapidity of change. Mr. Ellis and Mr. Sweet, if I understand them rightly, would ascribe to perhaps a single generation of mankind a change which in my view required hundreds, or perhaps thousands, of years. When Mr. Sweet imagines that he detects a "nascent pronunciation," and dreams that he has caught the Proteus in the very act of metamorphosis, I am as truly and heartily amused as he professes to be at some of the arguments of my book which he cannot answer: his theory is extremely ingenious, all that it lacks is—proof. It never seems to occur to these gentlemen who talk with such glib facility about changes actually going on, and whose brains are full of these *tendency*-cobwebs, how vast an *onus probandi* they are placing on their own shoulders. When they find *ee* (as in *ween*) "in the very act of changing" into *i* (as we sound it in *wine*)—as when *he sees me* is sounded nearly *hi size mi*—they forget they have to prove not only, which is easy enough, that the sound is such and such now, but also that the sound was different in the same mouths or among the same people twenty or fifty years ago. And that is just what cannot possibly be proved. We are only just learning—thanks largely to Mr. Ellis as a most accomplished teacher—to mark with accuracy the sounds of spoken language. We have never had till now a phonetic *De La Beche* to teach us "How to Observe." And consequently the statements of earlier students of dialects, especially their negative statements, must always be regarded with a certain degree of suspicion; besides that, our best philologists, until of late years, have paid no attention to dialects at all.

Permit me to quote part of my footnote on p. 118:—

"While I have positive evidence that 240 years ago, as now, the word *Thames* was sounded *Tems*, and *Thomas*, *Tomas*; and *disdeign*, *reign*, *flegme*, *siqne* did not sound the *g*—so Butler (1633) informs us; that 300 years ago the distinction of the surd and sonant *th* was, in every word that Hart gives, exactly the same as at present; that 400 years ago *hard*, *correk*,

salowship, *prevaly*, *deligent*, were written forms to represent the Scotch sounds then, as they do very accurately now, of *heard*, *correct*, *fellowship*, *privily*, *diligent*; that 500 years ago *England* was (at least sometimes) called *Inglad*; that 800 or 1,000 years ago *meny*, *many*, *mony* = *multi* were forms (I speak of the first syllable) that existed side by side—see Bosworth—just as in England, Ireland, and Scotland they do now—I cannot but look with suspicion on any theory which represents our language, or any language, as in such a furious state of ebullition and fermentation that, could our great-grandfathers start up from their graves, we and they would scarcely be able to understand one another's speech.

"That language does undergo changes no man in his senses can doubt; but, so far as the *evidence* goes, the change, in my judgment, resembles, not some violent chemical action, but rather the gradual and slow disintegration of the limestone or the granite of the everlasting hills."

To this Mr. Sweet's reply is a smile—the assumption and pretence of strength which may be based on the reality, and may not. The "philological world"—that is, Mr. Ellis and himself—are perfectly satisfied with their conclusions, and if proof is all that is wanting, no doubt that will turn up some day. Less informed scholars will ask for evidence, of course; but we will publish big books and frighten them into silence, and that will be as efficacious as any proof.

I have only, in conclusion, to congratulate Mr. Sweet on the singular good taste displayed in the sentence that contains the expression "unfortunate schoolboys," on which I forbear to enlarge.

R. F. WEYMOUTH.

DID MILTON SERVE IN THE PARLIAMENTARY ARMY?

1 Oppidans Road, Primrose Hill, N.W.: Oct. 23, 1874.

In the second volume, pp. 472 *et seq.*, of his *Life of Milton*, Professor Masson raises the question whether the poet ever was in arms among the Parliamentarians. He seems to feel that Milton *ought* to have been so; and also he finds in his writings a singularly minute acquaintance with military matters, of which he gives some very interesting illustrations. On the whole, Professor Masson concludes that Milton did not actually serve. "The proof positive," he says, "that Milton was not in the Parliamentary army is furnished by his own hand;" and he presently proceeds to quote the famous sonnet written "When the Assault was intended to the City." Strangely enough, he overlooks a passage in the *Defensio Secunda*, where Milton speaks explicitly and fully on this very point. It would seem that he was conscious that some persons in his own time thought, as his biographer in ours, that he ought to have taken his place in the ranks, and he vindicates himself at some length. Possibly he may have suffered some appeals of conscience on the subject. We may be sure he had fully debated the question with himself in that inner "forum." He was not the man to shrink from any duty, however distasteful, that he recognised to be a duty. "Were it the meanest underservice, if God by his secretary Conscience enjoin it, it were sad for me if I should draw back." The passage from the Second Defence is as follows:—

"Atque illi quidem [those who took up arms for the laws and religion] Deo perinde confisi, servitutem honestissimis armis populare; *cujus laudis etsi nullam partem mihi vindico*, a reprehensione tamen vel timiditatis vel ignaviae, siqua inforturi, facile me tuor. Neque enim *militiae labores et pericula sic defugi*, ut non alia ratione et operam multo utiliorem nec minore cum periculo meis civilibus navarim et animum dubiis in rebus neque demissum unquam neque ullius invidiarum vel etiam mortis plus aequo metuentem praestiterim. Nam cum ab adolescentulo humanioribus essem studiis ut qui maxime deditus et ingenio semper quam corpore validior, posthabita caestrensi opera, qua me gregarius quilibet robustior facile superasset, ad ea me contuli quibus plus potui; ut parte mei meliore ac potiore, si saperem, non deterior, ad rationes patriae causamque hanc praestantissimam quantum maxime possem mo-

mentum accederem. Sic itaque existimabam, si illos Deus res gerere tam praeclaris voluit, esse itidem alios a quibus gestas dici pro dignitate atque ornari, et defensam armis veritatem ratione etiam (quod unicum est praesidium vero ac proprio humanum) defendi voluerit. Unde est ut dum illos invictos acio viros admiror, de mea interim provincia non querar; immo mihi gratulor et gratias insuper largitori munerum coelesti iterum summas agam obtigisse talem ut aliis invidenda multo magis quam mihi ullo modo poenitentia videatur."

J. W. HALES.

THE LAST VERSION OF THE ODES OF HORACE.

6 Camden Crescent, Bath: Oct. 24, 1874.

Mr. R. Ellis, in his notice of my paraphrase of the Odes of Horace, is good enough to say that a great deal might be done to improve it by the alteration of single words and lines. He instances iii. 30. In looking below at what appears as a reprint of my version, I find that in verse 10 he substitutes "ill-natur'd" for "ill-water'd," as the equivalent of "pauper aquae."

Mr. Ellis cannot seriously think this an improvement; and if, as I suppose, it is a misprint, the change does much to destroy whatever merit my rendering of the Ode in question may possess.

R. M. HOVENDEN.

SUPURIOUS HEBREW COINS.

Guildford: Oct. 26, 1874.

We all have cause for gratitude to Mr. Evans, for the analysis of one of the coins which he regards as genuine. It presents the remarkable feature of the presence, in a silver coin of the value of twenty-seven pence, of nearly three pennyworth of gold, at the present relative value of the metals. Of four coins out of five, however, the analyst gives no opinion. I have myself had the opportunity of examining a specimen very similar to that described, and found it to weigh 216 troy grains in air, and 196 grains troy in water. This gives a specific gravity sensibly greater than that of silver. The propriety of trying the specific gravity of every newly-produced coin is thus abundantly shown.

Next to the completion of the survey of Palestine, the Palestine Exploration Fund can hardly render a more important service to the history of the Holy Land than by a collection of Hebrew coins of ascertainable authenticity. From the minute and exact provisions of the oral law we know, positively, that the annual Temple tax was regularly paid, in a coin specially destined for the purpose, during the whole time of the Second Temple. Without stating it expressly, the Talmud leads us to suppose that the coins in question were not eponymous; so that the date of any specimens of the "Jerusalem," "Israel," or "Zion" money can only be ascertained by comparison with coins bearing names of kings or high priests. Of these, besides the known Herodian and Asmonean series, we have the name of "Elesar, the Priest," and the letters, at least, of the name of Eliashib. These occur on an *assarion* figured by De Saulcy, in his *Recherches sur la Numismatique Judaïque*, plate xiii. fig. 7. The letters are involved in their sequence, but not more so than in some of the *naši* coins. With reference to these, in which it is possible that the word *Shemoun* may represent a proper name, they must, in that case, be referred to the pontificate of Simon the Just, as he was the only high priest of that name who was also president of the Sanhedrin. We have the sequence of the presidents since his date, and there is no high priest among them.

In reply to Mr. Evans's question as to the small silver coin (whether it were a *zuz* or a *garnes*), weighing sixty-three grains, and bearing the legend *Shekel Israel*, it is figured on page 125 of my little book, *The Child's History of Jerusalem*. It was accurately drawn under my own inspection: and was lent me for that purpose by the

* Isbister & Co., 1874.

Rev. Canon Tristram, as acknowledged in the detailed List of Illustrations.

FRANCIS ROUBILIAC CONDER.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Oct. 31.	8 p.m.	First Night of <i>Hamlet</i> at the Lyceum.
MONDAY, Nov. 2.	2 p.m.	Royal Institution: General Monthly Meeting.
TUESDAY, Nov. 3.	8.30 p.m.	Zoological.
WEDNESDAY, Nov. 4.	3 p.m.	Mr. Sydney Smith's First Piano-forte Recital (Hanover Square Rooms).
	8 p.m.	Geological. Microscopical.
THURSDAY, Nov. 5.	8 p.m.	Chemical: "On Methyl-hexyl Carbinol," by Dr. Schorlemmer; "On the action of Organic Acids and their Anhydrides on the Natural Alkaloids," by Dr. C. K. A. Wright; "Further Researches on Bilirubin and its Compounds," by Dr. J. L. W. Thudichum; "Action of Bromine in the presence of Water on Bromopropylalcohol and on Bromopropylacetic acid," by Dr. Stenhouse.
FRIDAY, Nov. 6.	8 p.m.	Linnean.
	8 p.m.	Philological: "On Ten Etruscan Words," by Professor Aufrecht.

SCIENCE.

On the Motion of the Fixed Stars. By Lieutenant-Colonel Drayson, R.A., F.R.A.S. (London: Chapman & Hall, 1874.)

THIS book is founded on a fallacy of rather a peculiar character, and one to which the author adheres with a pertinacity worthy of "Parallax" or Mr. John Hampden, though we are far from classing Colonel Drayson in the same category with those worthies. The controversy, if such it can be called, is one of long standing, and Colonel Drayson has so often been refuted without being convinced, that not much advantage is to be gained from pointing out the flaw in his reasoning, though his case may serve as a warning to those who attempt to solve difficult mathematical questions by elementary geometry. Colonel Drayson's point is that the pole of the earth does not describe a circle about the pole of the ecliptic, since the distance between them, or the obliquity of the ecliptic, is not constant. Now, if Colonel Drayson had considered the question apart from all prejudice, he might have concluded that it would hardly have been left for him to discover the very elementary fact that every point of the circumference of a circle is at the same distance from the centre, and he would perhaps have suspected that he did not clearly understand the theory he was criticising.

What astronomers really hold is that the motions of the poles of the equator and ecliptic, which together give rise to the precession of the equinoxes, are complicated where long periods are concerned, but that for a short time their effects can be calculated on the supposition that the pole of the equator describes in space a very small arc about the pole of the ecliptic, while the latter moves through a very small space towards the pole of the equator, or, in technical language, the pole of the ecliptic is the *instantaneous* centre of motion of the other pole, a term which simply expresses the fact that it begins to move normally to the line joining them. This is a mode of expression which is familiar to every one acquainted with the differential calculus, the only peculiarity being about the interpretation of the term *instantaneous* in this case, for the motions are so exceedingly

slow that our unit of time must be reckoned in centuries; and even in a hundred years the pole of the ecliptic moves towards the pole of the heavens by only one eighteen-hundredth part of the angular distance between the two poles, so that for a few years the change of position may be neglected in considering the motion of the other pole, by virtue of the principle known as "the superposition of small motions."

But Colonel Drayson's great quarrel with astronomers, is with regard to their statement that the pole of the earth would describe a circle in about 26,000 years round the pole of the ecliptic. This is exactly equivalent to the ordinary expression that a railway train is travelling sixty miles an hour, meaning that it would pass over that space in an hour if it moved uniformly at the speed which it has at the instant in question.

Of course different writers have expressed this distinction between uniform and variable motion more or less distinctly, but though some of them may have misled Colonel Drayson, any one who has gone far enough into the question will find that this has merely arisen from the attempt to put the subject into a popular form, without that careful choice of language which the Astronomer Royal has shown in his Ipswich lectures.

With regard to the theory of the motion of the stars, which Colonel Drayson has tacked on to his mare's nest, it is sufficient to remark that it depends on a bit of reasoning in a circle. The motion in 230 years is exceedingly small, so that there is not much difficulty in finding an arc of a circle which will represent the observations for that period, and this circular arc Colonel Drayson afterwards triumphantly compares with the observations themselves. It is rather significant that Bradley's determination, by far the most accurate of the last century, is omitted from the list, whilst Tycho Brahe's very rough result is included, and the values computed in the *Nautical Almanack* for 1850, 1860, and 1870, on the received theory, are given, instead of those actually observed. We cannot follow Colonel Drayson into any of the conclusions he bases on these slender data, but confidently expect that after the wonderful discovery he has made, he will long continue to enlighten the world with the startling results which flow from so simple a source.

W. H. M. CHRISTIE.

The Public School Latin Grammar, for the Use of Schools, Colleges, and Private Students. By Benjamin Hall Kennedy, D.D., Regius Professor of Greek in the University of Cambridge. Second and enlarged Edition. (London: Longmans & Co., 1874.)

THE second edition of the *Public School Latin Grammar* challenges attention on two grounds: first, because the author (to quote his own words) "has striven to bring out more prominently than before the leading facts of Comparative Philology, so far as they concern three kindred languages, Latin, Greek, and Sanskrit;" secondly, as containing an animated defence of the new

technical terms which (as is well known) abounded and were so widely objected to in the first edition.

We could wish, in spite of all that Dr. Kennedy urges in their justification, that the new technical terms had disappeared, and that more attention and space had been given to the application to Latin of the results of comparative grammar. What has been done in this way is, indeed, very useful and instructive; but we should have been glad of more care and less caprice in the author's proceeding. Of more care: for we find, for instance, on p. 555, the statement that "the Low-Dutch languages are Gothic, Friesic, Dutch, English, *et cetera*;" on p. 577 the statement that "the Sanskrit word for 'father' is (*pitrī* =) *pitar*, the Latin *pāter*, the Greek (*πατήρ*) *pātrōs*."* Of less caprice: for while many important results of comparative philology are mentioned, some equally important ones are omitted, as, for instance, the existence of the pronominal declension in Sanskrit, which is so strikingly analogous, in the words which it affects, to that in Latin; and the structure of the Latin infinitive, which throws so much light on its syntactical use.

The multiplication of technical terms to cover as many as possible of the various shades and turns of Latin construction appears to us to rest on a mistaken idea, that it is part of the grammarian's duty to show himself also a logician, and to arrange the turns of language as far as possible according to the categories of mental processes. No doubt this could be done were every mode of thought permanently stereotyped in particular languages. This is, however, so far from being the case, that confusions and cross-divisions are certain to arise as soon as an attempt is made to fit the facts of any given language at any stage in its development into the lines of those categories of thought within which, no doubt, languages as a whole live and move, but live and move with the greatest freedom and apparent divergence. Grammar can do little more than give names to the forms of words; to go further than this belongs to another science. We object to the introduction even of the logical terms "subject" and "predicate" into grammar, whose proper business is with noun and verb. For "subject" and "predicate," indeed, Dr. Kennedy is not responsible; but when he goes further and insists on our saying that in the sentence "*Dominus regnat*," "*Dominus*" is subject, "*regnat*" predicate; but that in the sentence "*Dominus est rex*," "*Dominus*" is subject, "*est*" copulative verb, "*rex*" predicative complement, or on our remembering that in the sentence "*Arma virumque cano*," "*virumque*" stands in an "annexive relation" to "*arma*," or that the ablative absolute is a "circumstantive enthesi," we are fairly baffled, and know not what welcome to give to these bastard children of logic and grammar.

Tell a boy that a noun substantive is the name of a thing or a living creature, and he will understand you; tell him that "a noun substantive is a name simply denoting something perceived or conceived" (p. 70), and he will learn nothing, or less than nothing: for you are explaining one unknown term by means of another. *Nihil ex grammatica nocuerit nisi quod supervacuum est* is a salutary precept of Quintilian, taken by Dr. Kennedy as his motto for this volume.

We earnestly hope that in another edition the technical terms may be simplified and reduced in number, and that a book which contains so many valuable facts patiently collected, and so much subtle analysis, may be thus rendered more attractive and intelligible to students of Latin.

H. NETTLESHIP.

ABRAHAM GEIGER.

SEMITIC studies, and especially Jewish literature, have lost in Dr. Geiger one of their most active and genial contributors. Abraham Geiger was born at Frankfort-on-the-Main, May 24, 1810. His early education was what we should call a Rabbinical one—i.e., all his time was employed in the study of Hebrew and the Talmud—a method in use among the Jews during the last generation in Germany, and still practised in Hungary, Poland, and the East. At the age of eleven or thereabouts the young Geiger began his career in a Gymnasium, and in 1829 he was a student in the Philosophical faculty of the University at Heidelberg, from whence he moved to Bonn. Here he won the prize for an essay on a question proposed by the Philosophical faculty, "On the Sources of the Koran," an essay which was printed in 1833 with the title *Was hat Mohammed aus den Judenthüm aufgenommen?* Already in this, the first product of his learning, the young doctor showed a thoroughly critical mind. The essay might, indeed, at the present day be re-edited in its original form, with very slight modifications. His succeeding labours fully confirmed the expectations formed from his first essay. We do not intend to follow his active career in Theology. We shall only mention that so early as 1832 he was appointed Rabbi at Wiesbaden, from whence he was moved successively to Breslau, to his native town, and finally to Berlin, where he died a few days ago. From the very outset of his career Geiger belonged to the party who were anxious to reform the Jewish synagogue in accordance with the necessities of the age, without, however, entirely breaking with the traditions of the past. He refused, therefore, to become preacher to the reformed congregation at Berlin, a body which gave up all Jewish ceremonies consecrated by history and antiquity. Endowed as he was with great eloquence and literary power, he exercised a considerable influence in many congregations throughout Germany and other countries, an influence which he maintained by the firmness with which he upheld his opinions in spite of all attacks and calumnies. It is marvellous how, though so fully occupied, he found time for the production of so many literary works of the greatest variety. We find him in the position of editor, and we may say chief contributor, to a quarterly publication for Jewish theology, which lasted from 1835 to 1847, and after being taken up again in 1861 lasted to the present year. In addition to this he published monographs on Maimonides, on the exegetical school of the rabbis in the north of France, on Elijah del Medigo, and on many other learned Jews of the Middle Ages. He contributed also to Hebrew periodicals numerous articles on Rabbinical literature, as well as to the *Journal of the German Oriental Society*, chiefly on Syriac lexicography and on Samaritan literature; in this

latter subject he was doubtless the highest living authority. His *Reading-Book on the Mishnah* is full of grammatical and lexicographical notes of the highest importance for the appreciation of the particular dialects of the Mishnah and the Talmud. In his monographs on the famous poets Salomon ibn Gabirol and Jehudah Halevy, Geiger showed his poetical talent by translating various pieces by these two poets of the Spanish school. In these translations he certainly did not reach the excellence attained by the late Dr. Michael Sachs in his poetical imitations of the Jewish poets of the same school, but his translation may be regarded as in many respects highly successful. To judge of his clearness, and the excellence of his German prose, we have only to read a chapter of his justly popular lectures, which are highly instructive even to students who are well acquainted with the subject of Judaism and its literature. They thoroughly deserve to be published in an English translation by the Society for Hebrew Literature of London. This notice may be concluded with the mention of his *Urschrift*, a work which he himself always considered as his *chef d'œuvre*, and in which he accumulated the results of twenty years' study. I myself never accepted his theory that the Sadducees derived their origin from the high priest Zadoc, but that they represented the Jewish aristocracy must be without doubt admitted. In this work are to be found two valuable hints on biblical criticism, especially in reference to the Samaritan text of the Pentateuch, and to that of the Septuagint, although on this subject also I cannot always agree with his results. The chief merit of Geiger's researches in regard to this branch of study is his powerful analysis of obscure Talmudical passages. We have lost in him, above all, one of those rare scholars who know how to handle the Talmud critically; a loss which it will take a long time to replace. AD. NEUBAUER.

THE ENDOWMENT OF ORIENTAL STUDIES AT OXFORD.

THE following memorial was presented to the Council of the University of Oxford nearly six months ago, but no notice of it has as yet been taken beyond a note from the late Vice-Chancellor to the effect that it "should receive the attention it deserves;" and we understand that even members of Convocation are as ignorant of its existence as the general public. The negative attitude of Oxford contrasts somewhat unfavourably with the conduct of Cambridge, where the establishment of a Chair in Sanskrit followed a memorial from the Royal Asiatic Society:—

"To the Convocation of the University of Oxford from the Council of the Royal Asiatic Society, established by Royal Charter for the Advancement of Oriental Literary Knowledge and Knowledge in relation to Asia.

"The Council of the Royal Asiatic Society of Great Britain and Ireland take the liberty of submitting to the Convocation of the University of Oxford the importance of making better provision for the teaching and encouragement of the study of the languages included in the Semitic Family in its most extended sense, but generally represented by the sister languages of Hebrew, Syriac, and Arabic.

"2. The Council are aware that there are already a Regius Professor of Hebrew and two Professors of Arabic, but they submit that, first, there is no provision whatever for Syriac; second, that the Hebrew Chair, from the nature of its emolument, a Stall in the Cathedral of Oxford, is a Chair of Theology and Exegesis of the Holy Scriptures rather than of linguistic science, and does not extend to the whole range of Hebrew literature, modern as well as ancient; and, third, that there is at present no encouragement for the study of Arabic.

"3. The Council submit that, though the Mahomedan subjects of Her Majesty exceed in number those of any other potentate, yet there are fewer Semitic scholars, and a more limited publication of Semitic texts, translations, and treatises, in the British dominions than in France or Germany, countries

* From this sentence the student would naturally infer that the Sanskrit form *pitrī* answered to the Greek form *πατήρ*. But the Greek *πατήρ* (= *patēr*-s) is the nominative answering to the Sanskrit *pitā* (= *pitā*-s), while the Sanskrit *pitrī* exists only as a base for the formation of certain cases like *patri*- in the Latin *patriōus*.

whose relations, and opportunities of intercourse, with Semitic nations are much more restricted.

"4. The Council submit that it is not a valid objection to this proposal, that there is at present no demand for instruction in Semitic languages among the graduates and undergraduates of the University; because the liberal endowment of efficient chairs, the appointment of professors of repute, and possibly the offering of some inducement, would attract students. Under any circumstances, it is the unquestionable duty of the great Universities of England to be at least as efficient as any similar institution in other parts of the world.

"5. The Council further remark that in all the Universities of Germany there are effective chairs of Semitic languages. Paris has become the very metropolis and centre of Semitic study, and thither flock all the young men, who will be the Oriental scholars of the next generation; the result even now is that, when any work requiring knowledge of Oriental subjects has to be undertaken, few Englishmen are forthcoming, and the chairs in Oriental languages, the posts of Librarians and Secretaries to learned Societies, the Cataloguers of Manuscripts (such as those in the Bodleian), are passing into the hands of Frenchmen and Germans. There is in consequence some risk of England losing the high station acquired by the labours of former Semitic scholars such as Hyde, Pococke, and the Prideaux.

"6. It may be that at the present moment the emoluments at the disposal of the University will prove to be insufficient, but there is reason to hope that, if the University make the first move, private liberality may do for Semitic what it has already done for Aryan linguistic science, and the English or Indian Governments might then be induced to supplement the endowment by special State Grants in return for the opportunities of instruction afforded to the public servants of the State employed in the East in diplomatic or administrative posts.

"7. The Council respectfully suggest that the linguistic teaching of Hebrew be provided for separately from the provision for Theology and Biblical Exegesis, and that a separate and purely linguistic chair, to be held by clerk or layman, be established for all the branches of the Semitic family, and that provision be made for a certain number of studentships.

“(Signed) HENRY BARTLE FRERE, President.
HENRY RAWLINSON, Director.”

MR. C. S. PARKER'S PROPOSALS FOR UNIVERSITY REFORM.*

THE occasion of this paper is the publication of the Report of the Royal Commission appointed, on the advice of Mr. Gladstone, to enquire into the property and income of the Universities of Oxford and Cambridge, and their colleges and halls.

Except a very brief expression of opinion, commending in some respects the efficiency of the management, the Commissioners have confined themselves to stating matters of fact.

And as these facts are now for the first time accurately ascertained and brought before the country, it must be presumed, with some view to further action, a favourable opportunity is presented for discussion such as may help to form public opinion on a question ripe for practical consideration.

First, then, what is the total amount of annual revenues in question?

This had been till now unknown. In 1852 a Royal Commission reported that, owing to the unwillingness of the authorities to answer questions, they had “little authentic information to communicate.” And in 1868 Mr. Pattison, Rector of Lincoln College, Oxford, says, “The information does not exist at present in an accessible form.” But now, “the Universities, the colleges, and all their officers have, with few exceptions, supplied all the information asked for.”

In round numbers, which for convenience will be used throughout, the Royal Commissioners report the total income in the year 1871 as being for Oxford, 414,000*l.*, or, including prospective increase to the year 1890, 538,000*l.*; for Cam-

bridge, 340,000*l.*, or, including prospective increase, 380,000*l.*

That is to say, in the course of centuries, by the liberality of numerous founders and benefactors, and owing to the continual increase in the value of land, the University of Cambridge, with her seventeen colleges, and the University of Oxford, with her nineteen colleges and five halls, have amassed property of which the aggregate income for Cambridge falls but little short of, and for Oxford exceeds, the “thousand pounds a day,” popularly supposed to measure the largest private incomes in this country.

When such princely revenues are compared with the modest incomes of our Scottish Universities (less than that of a successful ironmaster or merchant), or, indeed, with the resources of any other Universities in the Old or New World, and when it is remembered that with their pecuniary wealth and noble buildings Oxford and Cambridge inherit ancient fame and invaluable traditions, intellectual, moral, and religious, besides, until lately, a monopoly in England of the power of granting degrees, it may well be asked, in no unfriendly spirit, whether these great Universities are rendering equivalent services to the higher education of the country, and to the general commonwealth of letters and of science; and if not, whether any better distribution of their ample funds might make them more effective for the destined purpose.

But before we can speak particularly of these large amounts as endowments applicable to the various purposes of a University, considerable deductions must be made, and some explanations are required.

The Commissioners themselves have not said expressly whether they regard the total sums returned, as gross or net income. But apparently the outlay for management, repairs, improvements, rates, and taxes on landed estates should be treated as a deduction from gross income; and the same may be said of some 23,000*l.* a year applied to augment Church benefices in the gift of the Universities or Colleges. Subtracting these items, the net remaining income is for Oxford, 358,000*l.*; for Cambridge, 297,000*l.*

This net income, however, is not all endowment. For Oxford 77,000*l.*, and for Cambridge 62,000*l.*, is what the Commissioners call “internal income,” that is, money levied by the University or by a College from its own members, for room rent, fees, dues of various kinds, and profits in the buttery and kitchen departments. At the five Halls, seven-eighths of the income returned is of this nature. If any part of this could be regarded as endowment, it would be the room rent, and other dues, for use of college buildings. But the value of the buildings has been included in the return made of “external income,” and must not be counted twice. It would seem, therefore, that in order to arrive at the net value of the endowments, these items should be deducted, so that the net endowments may be stated for Oxford at about 280,000*l.*, and for Cambridge at about 235,000*l.*

We may proceed, then, to examine the distribution of the whole income. And first, we can only glance at and pass by the heavy items of miscellaneous expenditure on establishment, servants, college officers, rates and taxes on college buildings, repairs, pensions, allowances to residents, &c. To examine these to any good effect would require more time than is at our disposal.

Excluding, however, these more general items, the seven chief heads of special expenditure, in order of their magnitude, are as follows:—

	Oxford.	Cambridge.
Fellows	£102,000	£103,000
Scholars, Exhibitors, Prizes and Examiners	44,000	33,000
Heads	33,000	20,000
Professors and Tutors	24,000	12,000
Chapels, &c.	9,000	6,000
Libraries	6,000	4,000
Scientific Institutions	2,000	2,000

This distribution is hardly such as the general public would expect, and a satirical person might even suggest as an improvement to reverse the order, giving to “Scientific Institutions” 100,000*l.*, and to “Fellows” 2,000*l.*

But seriously, let us try to understand better the meaning and actual working of the present system.

Taking the number of residents in the university roughly at about 300 graduates, and 1,700 undergraduates, we find that most of the former, and two in five of the latter, derive substantial aid from endowments. At Oxford four-and-twenty heads of colleges and halls receive, on an average, each in money about 1,300*l.*, or, including houses and other advantages, say 1,500*l.*; forty professors, on an average, under 500*l.*, or, including the canonries of Christ Church, under 600*l.*; 340 fellows, each towards 300*l.*; 483 scholars, on an average, 70*l.*; and some 250 exhibitioners are “rich on 40*l.* a year.” The figures for Cambridge are not very different, except that the colleges have done much less than at Oxford to endow professors, who have, in all, only 9,000*l.* at Cambridge, as against 16,000*l.* at Oxford.

The Professors may be taken as representing special and profound knowledge of the subjects that they teach. In general they are underpaid, and it is evident that if the chairs were less poorly endowed the services of still more eminent persons might sometimes be obtained. The patronage also of many chairs might be better vested. But with whatever drawbacks, speaking broadly, the professors are the class on whom the universities chiefly depend for reputation in science and learning.

The Heads of Colleges are men chosen in ripe years by the fellows, usually from among themselves. Hitherto they have been selected for business capacity, or for personal popularity, as often as for learning. But experience shows, and it may in future be expected, that fellows elected by open competition will generally place at their head the most eminent of their number; and from this point of view there is some foundation for the claim put forward by Mr. Pattison, himself the learned head of a college, that the income of the heads should be regarded in part as a special, and not an excessive, endowment of learning. There are active duties also belonging to the head of a college, which if well discharged go far to justify his present income.

Leaving the Heads then as they are, we may go on to enquire, what are these Fellows, to maintain whom the two great English universities, through their colleges, spend each above 100,000*l.* a year? We have no such class at our Scottish universities. They have none such at the German universities. What do these six or seven hundred gentlemen do to earn the lion's share of the endowments?

According to the present practice, the new fellows are elected by the existing fellows of a college, after open competitive examination, in Oxford conducted always by the college, with the aid of assessors, if necessary, in special subjects. In Cambridge the smaller colleges elect upon the results of the university examinations. At Oxford a candidate is elected by any other college as freely as by his own; at Cambridge he must be already a member of the college electing. With this exception as regards Cambridge, the Fellows are supposed to be, and speaking broadly, they are, the ablest and most distinguished students, selected, with great impartiality, soon after taking their bachelor's degree, in general before the age of five and twenty. Once elected, for the most part they have no special duties, but are bound in conscience to the best of their powers and judgment to promote the interests of their college and of their university as a place of religion, learning, and education. Most fellowships are tenable for life, being vacated only on marriage, or on obtaining a fixed income from other sources of 500*l.* or 600*l.* a year. A clerical fellow usually remains in college till, after some

* Text of the paper read before the Social Science Congress.

years of service as tutor, he succeeds to a college living. Some laymen also remain for a time, taking part in the teaching, or pursuing further their own studies. But as there is no provision corresponding to a college living on which a layman can retire, residence with them, until of late, has been exceptional. As a general rule, they go to their professions. The average actual length of tenure of a fellowship is ten years, so that the average number of vacancies in a year is more than thirty, and the income, as has been stated, is towards 300*l*.

These "Prize Fellowships," as they have been called, are too plainly of the nature of sinecures not to have incurred criticism from the general public. They have also been attacked by University reformers, as a waste of University resources. The general public, taking the utilitarian view, have demanded that the Fellows should at least be bound to do some special service in return for their emoluments, and having but vague conceptions of any other special service to be rendered, they have in general held that Fellows, if not abolished, should be employed in teaching undergraduates.

Some University reformers, on the other hand, of whom Mr. Pattison, in his *Suggestions on Academical Organisation*, may be taken as the spokesman, have declared their opinion that "a vast diminution of the number of prize fellowships" would interfere but little with the inducements to University studies, and therefore that almost the whole of these funds may with advantage be diverted in another direction. They have definitely proposed that instead of thirty, there should be but two, or three prize fellowships annually, to be competed for not by Bachelors but by Masters of Arts, and that the whole residue of these endowments should be devoted to maintaining "a central body of learned men devoting their lives to the cultivation of science and the direction of academical education."

Mr. Pattison has not stated what salary, in his opinion, each such learned person should receive. But he has indicated, as corresponding to the gains of other professions, incomes ranging from 1,000*l*. to 1,800*l*. a year, admitting, however, that position, distinction, the pleasantness of pursuing liberal knowledge for its own sake, and the command of time for literary work, as compared with the slavery, say, of a Commissioner of Bankruptcy, or of the managing director of a bank, ought to count as an equivalent for some few hundred pounds a year.

According to this scheme, three hundred Fellows at 300*l*. a year would give place to some fifty or more additional Professors or learned persons, drawing double or treble the present salary of a Professor, with a considerable number of University lecturers looking for the succession to such lucrative appointments. Meanwhile, tutors, perhaps the hardest workers, would continue to be paid as now by fees, with some small supplement from the endowments.

The mode of appointment to these Chairs Mr. Pattison feels to be a matter of great difficulty and of vital importance, a question, he says, "*stantis aut cadentis Academiae*." He decides to vest the patronage in a Board of five Curators, from whose number he curiously and invidiously excludes all Peers, sons of Peers, members of the House of Commons, and Bishops.

Whatever may be the weak points of the present system, Mr. Pattison's proposal, it will be felt, runs too violently to the other extreme. It is doubtless desirable to increase the number of professors, to improve their income, and to take the best security that can be had for the election of the ablest and most learned. There is great force in the arguments urged in behalf of making the Universities at any cost centres of profound learning and science, and trusting much to the ordinary working of demand and supply to bring students to sit at the feet of eminent professors. Lord Bacon long since wisely censured "the small-

ness and meanness of the salary or reward which in most places is assigned to public lectures," and pointed out how, "if the fathers in sciences be of the weakest sort, or be ill-maintained," the meagre proportions of the teacher will repeat themselves in the pupils—

"Et patrum invalidi referent jejunia nati."

So far as a University has control of revenues, its duty and its wisdom is to provide for liberal remuneration of its ablest teachers, and not of oral teachers only, but of those who promote science by original research, or literature and learning by composing books.

But it is possible to move in this direction too fast, and too far, and a fair measure of the present requirements of Oxford at all events may be taken from the replies sent in by the several Boards of Studies and by the Professors themselves to enquiries addressed to them by the Vice-Chancellor last year.

It is curious to note the contrast between the demands of the older and of the more newly established studies.

Dr. Pusey and four other Theological Professors agree that no more Professors are wanted in that department, and at most two or three Assistant Lecturers would suffice.

The Classical Boards of Studies and Professors suggest the addition of two Professors and four Readers in Philology, one Professor and one Reader in Ancient History, and two Readers in Philosophy.

The Mathematical Board desire an increase of at least four Professors, two in Pure and two in Applied Mathematics, besides Readers.

The Modern History Board ask for a Chair of English History, a Chair of Literature in connexion with History, an additional Chair of Ecclesiastical History, and means for dealing with Archaeology, Numismatics, Military History, and Geography; also a staff of Readers. And the Board for the School of Jurisprudence require one additional resident and one non-resident Lecturer in Roman, and one in English Law.

But the largest demands naturally are those of the studies most recently established—the School of Natural Science, which grows like a young cuckoo in a sparrow's nest. The Board ask that the teaching of Physics, at present in the hands of one professor, should be divided among four—one for Acoustics, one for Heat, one for Optics, and one for Electricity and Magnetism. They also want a Chair of Experimental Mechanics, and suggest one of Civil Engineering. The individual Professors ask, further, for an addition of two or three in Biology, one for the department of Rural Economy as distinct from Botany, and a large increase of the staff for Chemistry; each new professor to have, of course, a separate laboratory and a demonstrator. In Geology the late eminent Professor Phillips was content to ask for one competent assistant.

The Hebrew, Sanskrit, and Anglo-Saxon Professors wish for no assistance. But Professor Max Müller reports that, if it be desired to establish a real School of Comparative Philology, there would be needed seven new Chairs for the Teutonic, Celtic, New Latin, Semitic, Persian, Egyptian, and Chinese, coupled, if possible, with Tataric and Mongolic; also, in view of our Indian responsibilities, a professor of the New Sanskrit languages.

Dr. Acland, as Regius Professor of Medicine, makes a scarcely less formidable demand, in case it be intended to make Oxford the seat of practical medical education, enumerating the Chairs which already exist in the University of Edinburgh, and the lectures at Guy's Hospital, as compared with the one Medical Professor at Oxford, himself. He suggests, however, that Oxford should rather aim at developing only the scientific side of medicine, in which case for the present four new lecturers might suffice.

Lastly, Mr. Ruskin, as Professor of the Fine

Arts, would be satisfied with two "Readerships," one in Modelling, and one in Painting.

This somewhat tedious list is given to show that, taking the requirements as stated by those most conversant with them, an addition at this time of some five and twenty or thirty professors, and as many readers, would suffice. And the largest salary suggested by any of the boards is, for a professor 1,000*l*., for a reader or assistant 400*l*. a year. But also it is pointed out by the Dean of Christ Church and others, that many of these Chairs would be worth maintaining only if a man really eminent in the subject were forthcoming, and failing this, the endowment might with more advantage be devoted to some other Chair. He therefore proposes that in the interests of learning and science a fund be formed and placed under control of persons carefully selected; that this board have power to assign professorships for life or for a term of years to men who have attained or are attaining eminence in branches of study not otherwise recognised in the University; and that such professorships as a rule be terminable with the tenure of the persons for whom they were created.

With such provision for the less necessary Chairs, all the requirements that have been announced might be provided for about 30,000*l*. a year, an expense which might be met by the appropriation of less than one-third of the fellowships to the maintenance of professors and readers.

Of the remaining fellowships Mr. Pattison would assign almost the whole, if not to professorships and headships, at least to eminence in the several departments of learning, such as can be attained only in maturer years.

The interests of learning pure and simple may seem to point in this direction. But before approving such an absolute change, we should remember that the question has other bearings.

In the first place, at the Universities and elsewhere, the general feeling is in favour of allowing a tutor to retain his fellowship, even after marriage, so long as he is rendering active service to his college as a place of education. Mr. Pattison's idea perhaps transcends all college interests. But if so, it belongs not to the present, nor to the immediate future. For the present there will be college tutors, and although their fellowships already bring in less than their fees, yet "to be paid wholly out of fees, or, if necessary, to have a small stipend in aid of fees," would be for them a downward step, to the position now occupied by private tutors, who also will probably continue to exist. For college tutors, the reform really needed is one which at Oxford has made great progress, namely, combination among the colleges to divide the work, so that each tutor may lecture on his special subjects to larger and better assorted classes than a single college can furnish. Of such college tutors, the most distinguished are on their way to become University lecturers or professors in the departments which they make their own. Meanwhile, some sixty or eighty fellowships must be retained for them.

But, also, something may be said in favour of prize fellowships generally. They encourage (too lavishly, no doubt) the devotion of many years at school and four expensive years at college to the courses of study marked out for the highest University honours, not only in the old schools of classical literature and mathematics, but in those of natural science, history, jurisprudence, and theology. To describe these studies as "the elements of the learned languages," is somewhat out of date, and less accurate than becomes a leading University reformer. If these are not the methods best adapted to lay the broad foundation of liberal learning, and further to prepare the bases on which future eminence in the several departments of human knowledge may rest, let the Universities acknowledge this, and rearrange their course of studies. But if the present course, or courses, for honours are believed to be

the best training up to the age of three or four and twenty, the latest to which most men can afford to continue their studies without liberal assistance from endowments, let this, too, be acknowledged. It is not well to grudge to those who at this age show the highest proficiency and fairest promise the prize of such an income, not for life but for seven or ten years, that they may enter on their professions, or on their further studies, free from narrowing cares and from the necessity of seeking, instead of higher attainments, immediate pecuniary returns. To underrate the influence for good that such University men have in their professions, in public life, through the press, and not least in connecting the Universities and colleges with the outer world, may be to take not a higher but a narrow and one-sided view even of the interests of learning.

It may not seem too much, then, to retain in all about two hundred fellowships accessible, as at present, to younger men by competitive examination, but terminable after seven, or at most ten years, except when held in combination with educational or other special duties. This shorter tenure, and the promotions of college tutors to University appointments, would cause a somewhat more rapid succession, so that there would be on an average, instead of two or three, some five-and-twenty vacancies each year. But it might be in the power of all colleges, as it is at present of some, by a majority of two-thirds, to elect to such a fellowship, without examination, a professor or public lecturer insufficiently endowed, or any person eminently qualified to render special service.

There would remain unappropriated of the present number some forty fellowships, or 12,000*l.* a year. For this sum it is easy to find employment. The laboratories alone, and other material requirements to which reference has been made, would soon exhaust it. Provision also may be needed for retiring pensions.

But a scheme more akin to the present application of the money has been propounded, and has been received with considerable favour. This is best set forth in an able pamphlet by the Rev. J. Percival, head-master of Clifton College, entitled *The Connexion of the Universities and the Great Towns*. The English Universities are not situated, as the Scottish Universities mostly are, in great towns. This has led to a divorce between commerce and manufacture on the one hand, and learning and science on the other, greater even than exists on this side of the Tweed. Mr. Percival's proposal is that the wealthier colleges should appropriate certain of their fellowships as stipends for professors, who should be members of the college, but should reside for six months of each year in the great towns, and become the centres there of study and intellectual life. The towns, on the other hand, he proposes should subscribe an equal sum towards the endowment of such chairs, and should provide suitable buildings, while the fees to be paid by students would add to the professor's income. On this principle, to provide for a great town a University staff of eight professors—say one of mathematics, one of chemistry, one of physics, one of physiology, one of Latin and Greek, one of history, one of law and political economy, one of moral and metaphysical philosophy, would require the appropriation of only eight fellowships. So that if Oxford and Cambridge undertook the negotiation each with four towns, thirty-two fellowships from each University, or less than one-tenth of the present number, would suffice. These fellowships would not be less, perhaps more, attractive than the rest as prizes. The successful candidates for them would for the most part be of maturer age than twenty-five, perhaps often promoted from prize fellowships, and themselves hoping for promotion ultimately to chairs at Oxford or Cambridge. For the advantages to be gained by this application of a few fellowships, reference may be made to Mr. Percival's

pamphlet, which well deserves a careful reading. His plan, or something like it, has been taken up spontaneously by colleges both at Oxford and Cambridge, and is thus in a fair way to receive a practical trial.

Provided (which should be the first consideration) that the central life remains vigorous at the universities themselves, there can be little doubt that Oxford and Cambridge would gain by thus connecting themselves with the larger centres of population, as there must be many persons fitted for the student life who cannot afford to make the first experiment by leaving their homes and places of employment to settle in provincial university towns.

Meanwhile the enterprise with which the old universities of late have taken on themselves the duty of examining the results of higher education throughout the country, must soon have the effect of greatly invigorating and raising the standard of the intellectual life at Oxford and Cambridge.

Looked at from this point of view, the 44,000*l.* at Oxford, or 33,000*l.* at Cambridge spent on scholars, exhibitioners, and prizemen, seems by no means excessive. Now that education is beginning to be organised throughout the United Kingdom, so that the ablest and most industrious children from the elementary schools may be assisted to receive a longer education, and then that the most successful of their number may again be selected for higher studies, and ultimately for a University course, it is not disproportionate to the great revenues of Oxford and Cambridge that they should offer between them annually about one thousand stipends of 70*l.* each, and perhaps half that number of stipends of 40*l.*, to the most promising students throughout the country for the four or five years of their university education. It seems desirable, however, that means should be taken to appropriate a fair number of the smaller stipends to students of the class who stand most in need, such as the poorer men who now live at Oxford or Cambridge unconnected with any college or hall. A few of the ablest of these from year to year have been elected to the ordinary open scholarships, but it would be well if some of the colleges would offer exhibitions to be competed for separately by "unattached students." One of the most successful of recent University reforms has been the permission thus to attend the University without incurring the expenses of a college. Experience has shown that degrees can thus be obtained, though with fewer advantages, at a much lower cost than had been possible, viz., for less than 50*l.* a year. The only exhibitions at Oxford as yet reported as being specially given to unattached students are two of 25*l.* a year offered by the Grocers' Company, and one of 30*l.* a year offered by a non-resident fellow of a College. Many of the Colleges, however, have been liberal in permitting them to attend College lectures without charge. The University has received from them in fees and dues more than has been expended by the delegacy who attend to their interests.

The University, unfortunately, as compared with the Colleges, is poor—"magnas inter opes inops." At Oxford the total University income, external and internal, including trust funds, is only 48,000*l.*, at Cambridge only 34,000*l.*, with little prospect of increase. This does not include any profits of the University Press, which seem to be omitted from the report. The activity of the Press at Oxford of late has been remarkable and highly beneficial to education and to learning; let us hope that it has been also lucrative. But one advantage of great wealth to a University is, that it ought thereby to be enabled to deal liberally as a publisher with authors, bringing out important works of learning or of science without too much regard to the market that they may command.

For this, as well as other reasons, it may be matter for regret that some part of the superfluous wealth of the Colleges does not belong to the Universities. But any proposal to treat the

property of so many distinct corporations as a common fund would be legitimately, stoutly, and successfully resisted. The most that is proposed in this direction is that the Colleges should tax themselves, in some fair proportion to their wealth, to form a fund for University purposes. But this could only be done by general consent, and perhaps not to any large amount.

It may have seemed to those who are familiar with the distinction between University and Colleges, that some of the proposals already discussed—the conversion of fellowships, for instance, into professorships—amount to taking College funds for University uses.

But this is not necessarily so. Already some of the Colleges, under the influence of the former Report and Executive Commission, have come forward liberally to maintain professorships for the benefit of the whole University—only retaining a special interest in the funds by requiring that the professor should become a member of the College, and that the College should have some honorary share in his election. A further extension of this not only is easier to accomplish, but in itself is preferable to an abandonment of revenues by the Colleges to the University. It tends to unite the professorial with the College system; to preserve the *esprit de corps* of the Colleges, which may be compared to that of regiments in the army; to evoke a generous rivalry among the wealthier corporations in bestowing such benefits on the general academical community; and lastly, which may perhaps enlist some support, it naturally leads to College expenditure upon laboratories and other apparatus for professors whom they have undertaken to maintain.

It seems scarcely possible that such reforms as have been indicated can be carried out on a large scale, and with enough of method and of order, except by the aid of some central body, either constituted by the Universities themselves, or, more probably, a new Executive Commission appointed by Parliament. But if the latter course should be preferred, it is important not only that full scope should be given for spontaneous action on the part of the Universities and Colleges, but that the public generally should know that the reform comes less from without than from within. Even the reforms accomplished twenty years ago were originated not so much by Parliament, or by public opinion, as by the prolonged and persevering efforts of a few leading members of the Universities. And now when these earlier reforms are beginning to bear fruit, when experience has shown the value of the professorial system, when a large number of the fellows of Colleges have been elected by open competition, when narrow college prejudices have begun to disappear, and voluntary alliances between Colleges are springing up, when the Universities are displaying in every direction unwonted energy, lengthening their cords and strengthening their stakes, the public should not be misled to think they have to deal with retrograde, obstinate, or lethargic corporations. Rather let them believe that with such aid from the Legislature as experience may prove to be required, the Universities and Colleges will take the lead in further reform, and will rise easily and gracefully to the position they ought to occupy before the world. Oxford and Cambridge have not held their own of late against the German Universities as seats of learning, though perhaps more might be said for them as places of wholesome education, schools for training able statesmen, learned judges, a liberal and enlightened clergy. But already the tide has turned; Europe has begun to recognise a change; and if they steadily pursue the course on which they have entered, the future will be theirs.

What has been brought forward in these necessarily hurried pages comes to this. Our great national Universities have at their disposal extraordinary resources. Much of their present application is good, but the whole should be examined from a central point of view, and any

waste at once arrested. Without revolutionary or communistic change, and avoiding extravagant expenditure in any one direction, it seems possible at once to retain the present headships as the highest rewards of learning; to strengthen the staff of University professors and readers—a point of vital importance—as much as they themselves desire; to supply such material resources as they need; to keep a liberal provision of prize-fellowships; to connect the Universities by provincial professorships with the great towns, if they will do their share; to maintain the existing supply of open scholarships and exhibitions; and to appropriate separate exhibitions in connexion with the poorer class of unattached students lately admitted to the Universities, and also with the local examinations which they superintend throughout the country. At the same time means should not be wanting for improving the College libraries, and especially for the better housing of the great Bodleian Library at Oxford, perhaps the most valuable in the world, which is not even free from danger of a conflagration.

If these items of expenditure seem to run beyond the ample income of the present, further affluence in the course of fifteen years will increase the endowments of Oxford by 124,000*l.*, and of Cambridge by 40,000*l.* The internal income also will increase with growing numbers, and if moderate fees be assigned to some of the professors, their stipends need not make so large a claim on the endowments.

One word in conclusion for the Scottish Universities, and specially here for the University of Glasgow. We cannot but feel somewhat painfully the contrast between the wealth of which we have been speaking and our poverty. Even the two or three prize fellowships—"reliquiae Danaum atque immittis Achilli"—which Mr. Pattison and his friends propose to leave to Oxford and Cambridge in place of thirty-five a year, would be a great boon to one of our Scottish Universities. With slender means they have fought on well, and by concentrating the income on a few professorships, and making free demands for fees, have even contrived to rob Oxford and Cambridge of many of their best scholars, to fill Chairs at St. Andrew's, Edinburgh, and Glasgow. But if the English Universities, out of their abounding wealth, are asked to colonise the larger towns, may not the wealthy towns of Scotland which already have Universities in or near them be moved to do more for their adequate endowment. It is hardly necessary to exhort them to this duty, for the golden stream has begun to flow, and perhaps nowhere more copiously than at Glasgow. But the soil is still thirsty, and whatever the great political economist may have said here to the contrary, we know from experience, as well as from Dr. Chalmers and all his pupils—"classis numerosa"—who to his and their satisfaction have slain Adam Smith's argument again and again, that in these higher departments of culture the crop will bear some due proportion to the artificial irrigation.

CHARLES STUART PARKER.

NOTES AND NEWS.

Physiological Action of Snake Poison.—An interesting paper on this subject, by Dr. T. Lauder Brunton and Dr. Fayrer, appears in the Proceedings of the Royal Society (No. 149, 1874). The snakes they have experimented upon have been, amongst others, the *Naja tripudians*, the *Ophiophagus elaps*, *Daboia Russellii* and *Bungarus fasciatus*, but especially the *Naja* and the *Daboia*, which last is a viperine snake. The general symptoms produced are in both cases nearly the same, consisting in depression, faintness, hurried respiration and exhaustion, lethargy, unconsciousness, nausea, and vomiting. In dogs, Guinea-pigs, and rabbits, peculiar twitching movements occur, which seem to represent vomiting in them; occasionally, in fact, dogs and Guinea-pigs do vomit, and dogs are profusely salivated. As the poison-

ing proceeds, paralysis appears sometimes affecting the hind legs first, and seeming to creep up the body, and sometimes affecting the whole animal nearly at the same time. There is loss of co-ordinating power of the muscles of locomotion. Haemorrhage, relaxation of the sphincters, and sanguineous or muco-sanguineous diarrhoea, often precede death, and are generally accompanied by convulsions. In fowls the appearance is one of extreme drowsiness; the head falls forward, rests on the beak, and gradually the bird, no longer able to support itself, crouches, then rolls over on its side. There are frequent startings, as if of sudden awaking from a drowsy state. Frogs are restless after the injection of cobra poison, perhaps however, only from the effect of the prick; a gradually increasing torpor succeeds, the limbs are drawn up, and the head gradually sinks forward between the hands. The power of motion is lost before that of sensation. The heart continues to beat after all motion in the body has ceased. The bite of venomous serpents generally proves fatal to innocuous serpents, but not always; while venomous snakes are not generally affected, either by their own poison or that of another sort of snake, no less than fifteen drops of venom having been injected hypodermically into a cobra without effect. The activity of the poison is not destroyed and is scarcely impaired by drying. Coagulation of the venom by alcohol does not destroy its activity, the poisonous principle remaining in solution.

Experiments made upon the mongoose (*Herpestes griseus*), long supposed to be unaffected by the poison of venomous snakes, either on account of some peculiarity in the constitution of the animal, or, as the story used to run, on account of its knowledge of some herb which it used to eat as an antidote, showed that when fairly bitten it succumbs like any other animal. Its great vigour and activity enable it to elude the snake. The pig, also thought to be proof against snake poison, escapes, probably by receiving the wound in the foot, where absorption is not rapid or vigorous.

Experiments were made to see whether cobra poison had any effect on the germination of seeds, and it was found that that venom does not prevent germination, but interferes with it, especially when strong.

The action of the poison is always most rapid when it is introduced directly into the circulation, as by injection into the jugular vein. It acts as a local irritant, causing suffusion and swelling when applied to the eye, and great extravasation of blood around the part where it has been injected. It does not produce any apparent change in the blood-disks or in the coagulation of the blood. It destroys the irritability of the muscles when directly applied to them, and softens the tissue, rendering it apt to decompose.

In regard to the cure of snake bites, they have no belief in the efficacy of the plan suggested by Dr. Halford, namely, the injection of ammonia; but they think death might be prevented in some instances at least by the combined action of transfusion of blood and the maintenance of artificial respiration.

The Role of the Gases in the Coagulation of the Blood.—MM. E. Mathieu and V. Urbain, in a paper communicated to the Academy of Sciences at the meeting held on September 14, 1874, state as the result of their experiments: 1. That carbonic acid is the agent of the spontaneous coagulation of the blood. 2. That during life the obstacle to this coagulation resides in the blood corpuscles, these having as their special function the fixation not only of the oxygen, but also of the carbonic acid contained in the blood. As a result the coagulating action of the last-named gas cannot be exerted in physiological conditions. They proceed to show that there are many proofs of the participation of carbonic acid in the phenomena of the spontaneous coagulation of the blood. Thus, the amount of CO₂ contained in blood before coagulation, and

after coagulation, was at 100° Fahr., 48.05 and 39.38 cc.; at 86° Fahr., 50.00 and 44.85 cc.; at 59° Fahr., 49.00 and 40.95 cc.; and at 50° Fahr., 54.50 and 42.50 cc. Again, the blood which returns from glandular organs, and especially from the kidneys, is incoagulable, and this blood contains very little carbonic acid (renal arterial blood 49.78 cc. per cent., renal venous blood 16.00 cc. per cent.). So also, if the removal of carbonic acid from the blood be favoured by simple exosmosis, coagulation will not take place; yet if it be placed in an atmosphere of carbonic acid, coagulation rapidly sets in. The clots, however, are softer than those which form in air, rendering it probable that oxygen influences their consistence. Lastly, certain neutral salts impede or prevent coagulation, but such salts fix a notable volume of carbonic acid, and thus withdraw it from the blood.

The Conduction of Sensory Impressions in the Spinal Cord.—The part just issued of Ludwig's *Arbeiten aus der Physiolog. Anstalt zu Leipzig für 1872* contains several interesting papers. Among others is one by V. Nawrocki, who states that in 1870 Miescher arrived at the conclusion that the fibres of the sciatic nerve, which can produce elevation of the blood pressure by reflex action, run, after their entrance into the cord, in the lateral white columns. Several years previously Türk had maintained that these columns contained sensory fibres. The researches of Miescher left it doubtful whether a portion of the sensory fibres acting upon the muscles of the vessels did not run in the grey substance of the spinal cord, and Nawrocki's experiments were undertaken with the view of determining this point, and he has satisfied himself that all the fibres of the sciatic nerve, which reflectorially effect increase of blood-pressure, run upwards within the upper segment of the lumbar region of the spinal cord in the lateral white column.

New Method of procuring Large Quantities of Lymph.—Dr. Lesser (Ludwig's *Arbeiten*, 1872, p. 94) states that he has been successful in obtaining large quantities of lymph by placing the animal (dog) under the influence of woorara, and introducing a tube into the thoracic duct, while artificial respiration was maintained. Occasionally the tube becomes stopped up with coagulum, but it may easily be cleared with a fine wire. The quantity procured amounted in 55 per cent. of all the animals experimented on, to more than 0.6 cubic centimetres per minute.

At the Congress at Lille of the French Association for the Advancement of Science, an elaborate address was delivered by M. Wurtz, in the course of which he reviewed the progress of chemistry from the time of Lavoisier to our own day. Coming to the discoveries showing that certain atoms, or substances, could be removed from compounds, and others substituted for them, he said, all the compounds derived by substitution, affecting the same substance, were ranged in the same family of which that substance was the head. From thence arose groups of bodies perfectly distinct from each other, the number of which was increasing every day. The honour of classifying them belonged to Laurent and Gerhardt. Laurent was the first to point out that a certain number of mineral and organic compounds had the same composition as water, and this idea, brilliantly developed by Williamson, had been generalised by Gerhardt, who referred all compounds, mineral and organic, to a small number of types, of which hydrochloric acid, water, and ammonia, were the principal. In these comparatively simple compounds, one element can be replaced by another element, or by a group of atoms behaving as a radical, in such a way as to yield a multitude of compounds related to each other by analogy of structure, if not by resemblance of properties. Bodies of the water type, mineral and organic, are, according to the nature of their elements or their radicals, powerful bases, energetic acids, or neutral sub-

stances, facts which connect together the most diverse bodies and break down the barriers which former theories had imagined between inorganic and organic chemistry. In reply to the question why the bodies mentioned as types deserve that title, M. Wurtz explained that certain elements impressed definite characters on their compounds. The atoms of chlorine are so constituted that one of them only wants one atom of hydrogen to form hydrochloric acid, while oxygen takes two atoms of hydrogen to form water, and one atom of nitrogen requires three to form ammonia, and one atom of carbon takes four to make marsh gas. At the moment of combination the atoms rush together, and there is usually an evolution of heat resulting from an expenditure of active force in the *mélange*. Atoms of different bodies are not endowed with the same aptitude for combination, and when atoms combine, their movements are subjected to a reciprocal co-ordination which determines the pattern of the new system and its equilibrium. Alluding to the connexion of chemistry and physics, M. Wurtz observed that it is in the movements of atoms and molecules we must look to discover, not only the source of chemical forces, but also the cause of the physical modifications which matter undergoes, including the phenomena of light, heat, and electricity. Illustrating the modern theory of heat, he said: heat a bar of steel and it will dilate with an irresistible force, a portion of the heat having been employed in causing a divergence of its molecules. Heat a gas, it will likewise dilate, and a portion of its heat disappears in producing its still greater dilatation; and it is easy to prove this consumption of heat, for if you heat the same gas without permitting its dilatation, it requires less heat to raise it to the same temperature. Heat produces three different effects: an elevation of temperature by increasing the vibratory energy, an augmentation of volume by widening the distance between the atoms or molecules, and finally, by further amplifying their trajectories it destroys the equilibrium of the system, producing decomposition, or fresh combination. He asks, is it easy to conceive that the physical and chemical forces which act on ponderable bodies are applied to matter in a diffused and continuous state. Is it not more natural to suppose that they operate upon definite and limited particles which represent the points of application of all the forces? According to this view, the universe is formed of two sorts of matter, ether and atomic substance: the one infinitely rarified, homogeneous, and filling all space, and consequently enormous in its mass, impalpable and imponderable; the other discontinuous, heterogeneous, and only filling a very limited portion of the immensity of space, although it forms the great assembly of worlds.

Students of the new chemistry will be familiar with most of these explanations, but we have extracted them from a report of the entire address given in the *Revue Scientifique*, because they supply an excellent and popularly intelligible *résumé* of a chemical philosophy that harmonises with the development doctrines of the Darwinian school.

FINE ART.

THE DUDLEY GALLERY: OIL-PICTURES.

THE eighth exhibition of "Cabinet-pictures in Oil" opened at this Gallery on October 26. It is a sufficiently meagre collection: mediocrity is spiced with skill, and relieved here and there by something that has artistic purpose or method of a superior kind.

The most charming picture in the gallery is contributed by Mr. Hughes, and the most disciplined one by Mr. Legros. *Our Daughter*, by the former artist, represents a lovely maiden, full of the grace and sentiment of an English girl of breeding, somewhat wan and fragile in her exquisite bloom, who half kneels on the grass of the lawn to caress a white pigeon; she compresses its back lightly

downwards. Her father and mother, old-fashioned county-people with immensely florid visages and redundant corporations, look on from the background, with sunflowers dispread around them, and beagles pacing about. Mr. Hughes has perhaps never done anything more tender and gentle than this little work; which is as much as could well be said in that line of encomium. Mr. Legros's painting, named *A Fishmonger*, presents the interior of a shop, apparently (to judge by the view out of window) in some English cathedral town; the character of the two denizens of the shop, however—one of them in shirt-sleeves, the other wearing his hat and smoking a short clay pipe—is certainly not English but French. The well-varied stock of fish is painted with that excellent combination of simplicity, ease, and spirit, which distinguishes Mr. Legros's work of this kind. He is one of the painters who can treat a subject not calling upon the powers of thoughtfulness or invention, with a dignified reserve and unembarrassed seriousness which avail to keep the work far above the level of triviality, and within the limits of fine style in art.

Mr. Stanhope selects, in *The Banks of the Styx*, a grand and strange theme, making severe imaginative demand: naturalism would not here count for much, and has not been aimed at. We see two lovers, forlorn souls wearied out with the life-struggle, waiting on one side of Styx, while Charon in his boat rows towards them up the stream: they are eager to be away and across, though a happy peace seems not destined to be theirs for ever. The rockbound rivulet, the ironbound crags, the conception of the figures themselves, give much unity to this work—in some regards, the most important on the walls. In essential respects, we prefer it considerably to Mr. Poynter's much smaller canvas, *Psyche's Awakening*, where the nymph is represented catching her first sight of the Mansion of Love, as described in Mr. Morris's poem:—

"She, standing in the yellow morning sun,
Could scarcely think her happy life was done,
Or that the place was made for misery."

This composition gives a certain lofty, dreamy impression, with its sweep of half-beclouded mountains dusky reddened in the dawn: the colour, however, is not felicitous, showing more of a mauve-tint than of a "yellow morning sun." The whole treatment has something that seems caught from Mr. Leighton, and is more scenic than rightly ideal. *Dawn and Day*, by Mr. Watts, must also be counted less than successful. Dawn is a female air-floating figure—not the rosy-fingered Aurora, but an embodiment of those early and pallid beginnings of light when the reign of Darkness is still well-nigh undisputed, destined though it be to rapid overthrow. Her drapery is of obscure blue in rippled folds, prolonging the tint of the more broadly-rippling blue sky below her, which we think the best point in the picture. Day, poised behind her in the air, is a male impersonation, ruddy-fleshed, and with rufescent varicoloured wings. The pose and action of both figures are rather of the lax, half-thought-out kind, and their faces undefined.

Mr. Storey rarely gives us anything that is not well treated from its own point of view; but there is irritating insignificance in the subject-matter. Such is the case with *Enough is as Good as a Feast*, in which we find a gentleman of the seventeenth century dining off a pheasant, and his housekeeper holding a second pheasant in her hand. This is Dutch art with a vengeance: not so low in type, certainly, as many well-accredited specimens of the schools of Holland, but just as destitute of meaning and artistic *raison d'être*. The better the workmanship, and the more pleasing the detail of social life in costume and accessory, so much the more unsatisfying does the sum-total remain. Mr. Hodgson continues to gain in firmness and completeness of execution: his *Postmaster-General's Office, Tangiers*, appears to show something of the influence of Gérôme, super-

induced upon the painter's own mode of work. *A Lowland Fisherman's Home* exhibits to advantage the strong, resolute, rather hard-featured manner of Mr. Hemy. It is pleasant in *ensemble*, and in detail also; but would lose nothing by a little more suavity along with its positiveness. The *Orange Girl* of Mr. Thomas Grahame, a young Irish woman under the colonnade of a London theatre, has force and spontaneity, but beyond this not much. Mr. Pepys Cockerell, in the painting named *First on the Spot*, has chosen an odd subject, and treated it cleverly: a gentleman of the time of Charles I. who has been slain in a duel beside a willow-bordered streamlet, and whose corpse is enquiringly snuffed at by two calves, let out to browse the morning herbage. Mr. Walter Crane has seldom missed his mark more observably than in the little specimen of affectation entitled *Cupid and my Dame*, with a quotation from Spenser.

Two works which may be called promising are the *Poor Travellers* and the *Maidenhood* of Mr. Wise; the first has a certain intensity of aim, and the second breadth of manner. The *Waning Light* of Mr. P. R. Morris may be commended along with these. Pictures are contributed by two ladies of the Epps family: *Under the Pears*, by E. Epps, and "*Because the Music went that Way*," by N. Epps. Both ladies have talent of a superior kind, and fine practical training; the second specimen is the more satisfactory, and, with its vigorous direct method of realisation, is not far from attaining all that it aims at. *Dwellers in the Desert*, a figure-subject with a smoking Arab and a hoopoe, is interesting as coming from the hand of the admirable painter of landscape and sea-pieces, Mr. Henry Moore. *Bertie, a Portrait*, is the contribution of Miss Alyce Thornycroft; a damsel in an orchard-clump, accompanied by a white kitten (if indeed the rather ungeneric-looking animal is of the feline kind). This is an incomplete work, yet not wanting in style. *Welcome as the Flowers in May* is not a fortunate specimen of Mr. Robert Macbeth's uncommon capacity. It represents a young lady entering a room, holding a nosegay—perhaps as a birthday present to some unseen parent or grandparent. The action and expression are impulsive, but the face, with its beaming eyes and open mouth, misses softness in the effort after eagerness, and must be pronounced somewhat clumsy. *He won't hurt you*, by Mr. Heywood Hardy, a rather dressy little girl with a bloodhound, is carefully and approvingly painted. The like praise, in unstinted measure, belongs to *The Young Signor*, by Mr. J. Forbes-Robertson, a gentleman whose recent successes as an actor should not make us forget that he has, if he likes to work for it, a future before him as a painter as well: this handsome mediaeval Italian head is portrayed with vigour and fine taste. The last figure-subjects which we need name are by M. Régamey, *Un Bicaouc de Tirailleurs Algériens*, *Turcos*, *Campagne de la Crimée*, a well-sized and fairly effective sketch; and by Mr. Hayllar, *A Visit to the National Gallery*, showing an elderly farmer and his wife asleep amid the masterpieces of old art—true enough, and, in all conscience, low enough.

In the landscape section we re-encounter three of the painters already named—Messrs. Macbeth, Moore, and Hemy. "*While Fishing-boats lie nestled in the Bay*," by the first-mentioned artist, is perhaps the most telling picture in the room—the one which most decisively catches the eye by force and luminousness of execution. On inspection, it is little "painty" (as artists say), but none the less skilful and striking: Mr. Macbeth evidently has before his mind's eye, as a model, the pictorial method of Millais, and no more masterly standard of practice need be wished for among our exhibitors. A subject of a nearly similar class has been selected by Mr. Hemy—*Salmon Fishermen Mending Nets*: a good example of his style, though not absolutely one of the best. By Mr. Moore are *Late Autumn*, *Frosty Morning*, grey and

graceful; and the *Mediterranean in a Gale, Study*. The often misused name of "study" is rightly applied to this excellent production; which, with great rapidity and even offhandedness of work, does nevertheless embody very acute perception of appearances and understanding of the underlying facts. The ship tosses; the lumpy sea, blue in general tint, shows frequent bottle-green linings of the tumbled weltering billows, and white crests which vapour off here and there into pouring spray-drifts. Another really noticeable storm picture is *The Wreck on Boulogne Sands* of Mr. Arthur Severn—perhaps the best work he has ever produced, for impressiveness and dignity of conception, combined with well-balanced and disciplined execution. The storm has been wearing on this long while, and is now dim and ghostly; a dreadful red light perturbs the horizon; grey veils of cloud lift and thicken again; grey waves swirl in, sweeping the bare level of dubious-tinted sand. The pictures of Mr. Hamilton Macallum might, for strenuous force, be named along with the one by Mr. Macbeth already noticed; he has indeed a very vivid sense of the strong overmastering contrasts or alliances of light and shadow at sea,—the loaded local colour, the densely darkened recesses of the unresting ripples. Of his three contributions, the one named *Into a Quiet Haven* is perhaps the least commendable, extremely forcible though it certainly is. *Taking on board the Skipper* shows a full measure of skill in the treatment of figures as well as scenery; and *A Westerly Breeze* is highly enjoyable—only less fresh and bracing than its subject-matter of ridged and densely blue sea, with the legioned seagulls dipping and hovering, flocking and dispersing momentarily. Another painter who has worked with much vigour of brush and liquid depth of colour is Mme. Cazin, whose *Evening* is noticeable for effect. Mr. Alma-Tadema sends a small landscape with a figure of a girl on a heath sheltered under her sunlit parasol, *Sunny Days*; a capital bit of truth, interpreted by an artistic eye and hand.

Other landscapes may be cited summarily, taken mostly as we pass them on the walls. *The Great Fire at the Pantheon, as seen from Hyde Park*, by the portrait-painter Mr. Richmond, an interesting record. *After Rain, Trefriw, North Wales*, by J. Aumonier, a capable study of torrent-form; also *Rumbling Waters*, by Tristram Ellis, somewhat similar in general subject, with more variety and more of the obvious look of liquidity. *A Summer's Eve*, by Joseph Knight, effective, but rather heavy-handed. *The Moated Grange*, by W. Christian Symons, well felt, and with good foliage-drawing. *Leafless*, by George Harvey, a picture of trees in mid-winter. The work of Mr. Lexden L. Pocock, to which is appended the quotation,

"The moon charms the watery world below,

Wakes the still seas, and makes them ebb and flow," is agreeable in its tone of colour, compounded of green, blue, and grey. Along with *The Hour of Smoke, South Devon*, by Percy Macquoid, and *The Castle at Harlech, from the Marsh*, by J. W. B. Knight, some small pictures by Mr. Edwin Edwards, the etcher, deserve notice; particularly *Mousehold Heath, Norwich*, with the spire of the cathedral, and some few other lofty summits, just showing over the solid expanse of the heath itself. By Claud Calthrop, *In the Villa Borghese, Rome*, large and forcible. By John Parker, *Cottage at Brilles, Warwickshire*, in a manner studied from such executants as Messrs. Walker and Pinwell; a very efficient piece of work, rather too bare in surface. Two Swiss mountain-scenes by Mr. Gale, *Valley of the Schmadribach*, and *Wengen*. *A Lake*, by T. Blake Wirginian, is marked by facile realisation; also *Through the Brook*, by A. B. Grahame, with tangly vegetation across the stones which pave a rivulet. *River-scene, Holland*, by Charles Thornely, praiseworthy for sunlight. *Early Spring in the Woodlands* is a pleasant work

by Mrs. Harry Goodwin; who sends likewise a rocky coast-scene, the refined style of which derives partly from Turner and partly from Alfred Hunt. This lady's husband contributes a curious subject, *The Sea, Above and Below*: in the central compartment we discern the surface of the sea; in the two side-compartments, the fishes swimming within its waters. *Blessing the Sea*, by W. L. Wyllie, a French fête-scene, is bright and minute; *On the Nile near Cairo*, by Ditchfield, portrayed with much exactitude. One of the laudable foreign exhibitors is H. W. Mesdag, author of *Unloading a Herring-Boat, Schevening*. Mr. Prinsep's *Autumn in the Isle of Wight* counts among the more considerable landscapes here: it has a natural but rather a heavy aspect.

In animal-painting, we have to notice the *Tim* of Mr. Nettleship; a youthful lion taking his ease in a quiet retreat. There is less subject here than in several of the painter's conspicuously fine studies of wild-brute life, but the same general quality of truth and intellectual observation. See also the painting of Mr. J. Macbeth, *Dozing*—a pinky-white cockatoo amid hydrangeas and other harmoniously tinted blossoms; and, for ordinary flower-painting, as usual, the three masterly examples by M. Fantin. The exhibition contains one single sculptural work, the terra-cotta by M. Dalou, *Payzanne Française*; a charming thing, like all else that its author produces.

W. M. ROSSETTI.

NOTES AND NEWS.

MR. WATTS, R.A., has recently commenced a painting of considerable size, the subject of which is a hitherto untouched moment in the story of Lady Godiva. Artists have invariably treated either the ride through the town, or the moment of setting out. In either case we naturally find her represented as occupying a very unusual situation with an unabashed courage, driven by a touch of self-consciousness almost past the line where impudence begins. Mr. Watts has set himself the task of conveying to the spectator an impression of the cost to the woman herself at which such an action as this must have been performed.

"Not only we that prate
Of rights and wrongs, have loved the people well;
but she
Did more, and underwent and overcame,
The woman of a thousand summers back."

Mr. Watts has selected the only moment in the rendering of which could be fitly embodied the suffering entailed by the execution of the act, the moment of Lady Godiva's return after the deed has been accomplished. To depict hesitation at the point of setting out could only distress us by conveying the possibility of her refusing, with natural weakness, the ordeal before her; and the ride itself must be without an instant's faltering. Whatever occurs in her path she must none the less fearlessly bear up; but at the moment of return the dread reaction would swiftly overtake courage taxed to its uttermost powers of endurance. Mr. Watts shows the lady falling fainting from her palfrey into the arms of the women who have hurried to receive her at the stroke of noon.

MR. LEIGHTON, R.A., is engaged in carrying out at the same time two very diverse works, each of which is in itself an undertaking of great importance. His small oil sketch treating the procession of the Daphnephoria has already been described in these volumes (ACADEMY, March 28). This sketch he is now carrying out on a scale so considerable that its demands would seem likely to absorb the whole energies of the painter; but the restless genius of Mr. Leighton has found another vent. His charming talent in modelling is appreciated by all who have had the good fortune to see the sketches in clay which he has executed from time to time. One or two groups of the procession of the Daphnephoria have been thus carried out by Mr. Leighton: we may men-

tion one in particular of three girls who advance dancing, their robes floating backwards on the air, which is wonderfully attractive from the lively grace of movement which has in it been successfully caught. There is, however, one subject having an independent motive which was produced by Mr. Leighton last winter, and immediately commanded the admiration of the most competent judges. This remarkable group represents an athlete struggling with a serpent which has entwined itself round his body. It is not too much to say that it is as fine as any antique of its size which has come down to us. Mr. Leighton's friends were unanimous in urging him to carry the group out upon a larger scale. This is what he is now engaged in doing. The statue, when finished, is, we believe, to be cast in bronze; should it fulfil ultimately the promise of the smaller model, it will be the greatest, the most complete work which Mr. Leighton has yet accomplished.

THE statue of Artemisia in the Mausoleum room at the British Museum is at this moment in course of being set up anew. The pose of the whole figure, as originally set up by the late Mr. Westmacott on its arrival in this country, has always appeared awkward and unsatisfactory. Something was evidently wrong with it, something unexplained. Mr. Storey's restoration, which has for some time past been standing by the side of the statue, only showed this the more plainly, and it was at last resolved to take the figure to pieces, and to set it up anew. This is a very arduous process, and not to be lightly undertaken. It involves considerable labour spent in merely digging out the lead with which the figure is plumed, and in sawing across the seams of plaster which cement the original fractures. When at last these fractures are laid bare and clean, there begins a task which is terribly trying to the nerves and patience of the most phlegmatic workman. Each separate fragment has to be refitted, and in the present instance the labour was rendered even more onerous than usual, because, the opportunity presenting itself, it was thought desirable to try over again the heap of unfitted fragments which had been brought from the Mausoleum, and which had not yet found a place. Here, again, a word of comment is perhaps necessary. This trying of fragments requires not only the most acute and sustained attention accompanied by lively ingenuity, but experience has shown that it can only be successfully conducted by a person who has never previously handled the pieces with the same intention. The eye must be quite fresh, and unprejudiced by any past associations. Fortunately, a capable man was at hand, to whom the Mausoleum fragments were unfamiliar, and two very important discoveries have been made, the first involving a total change in the plumbing of the statue. One of the principal fractures passed right through the lower limbs, breaking through the right knee, from which, indeed, a large piece was detached, which has not been found. This fracture in Mr. Westmacott's restoration was kept apart and open by a seam of plaster about two inches thick, and thus the upper portion of the body was given a backward inclination, whilst the leg below the knee was stiffly thrust forward. It is now ascertained that the fracture is a clean fracture, the edges fit, and there is not, nor ever was, any pretext for separating them in the manner above described. The consequences in altering the pose of the statue are most serious. The upper part of the figure, instead of inclining backwards, leans gently forwards, the right leg from the knee being slightly withdrawn beneath its weight. Thus an effect of height and dignity is instantly gained, and the sense of squareness, heaviness, and difficulty which has of old distressed the eye disappears. The second discovery is scarcely less important than the first. Artemisia wears a garment, one end of which is brought over the left shoulder from behind, whence it falls in heavy folds down the front in a perpendicular direction.

These folds terminated in an abrupt fracture. Mr. Storey, in his restoration, continued them nearly to the ground, and ended them in an inelegant little knob. Three days spent in incessant fitting and refitting, brought to light among the broken fragments the actual piece required to finish the folds of the drapery. They terminate in a pointed end, which is now in its place, and not only shows us how these folds finished, but also at what distance from the ground.

AN exhibition is to be opened at Blois, in the château, in the month of May, 1875. The municipal authorities have voted the sum of 35,000 fr. for the fitting up of the wing of Gaston of Orleans for the exhibition, which will include one of retrospective art.

SOME important frescoes of Pietro Perugino, the master of Raffaello, have been discovered in the cathedral of Corneto. M. Bompioni, a painter, has been sent by the Minister of Public Instruction for Italy to examine and report upon them.

A MONUMENT is about to be erected at Père-la-Chaise to the memory of Frédéric Soulié. It is entirely of Belgian granite, the work of the sculptor Roland, and ornamented with a bronze medalion in high relief by Clésinger.

THERE has been lately found at Corbie (Somme) a fine painting by Vandyke. This picture, which is signed, is 60 centimètres by 104, and is painted on oak panel. It represents the interior of the apartments of Vandyke, with his family, on a day of Kermesse, after supper. It consists of ten figures, and on the walls of the room hangs the *Ecce Homo* of Vandyke, with other pictures and various objects of art.

THE *Chronique* reports the discovery of a splendidly carved and painted reliquary of early fifteenth century work in the church of Marsal, a church already rich in relics of the Middle Ages. The reliquary is in the form of a church with five naves, and is 73 centimètres in length, 31 in breadth, and 35 in height. On the outside are sculptures in relief, representing the Adoration, Christ with His Disciples, and the Annunciation and Coronation of the Virgin, executed, it is said, in a most masterly manner, and in the interior are little niches in which are placed statuette. This curious cathedral in miniature was formerly surmounted by a spire, but this, as well as most of the pinnacles of the buttresses and delicately carved finials and crockets, has been broken off. Several of the groups of sculpture appear to have been imitated from those of the Cathedral of Reims, a circumstance which makes it probable that the sculptor of this beautiful little reliquary was an artist working in that city. Traces of painting and gilding still remain upon it. It is proposed that it shall be properly restored and again placed in the church of Marsal. It is not stated how such a treasure came to be hidden, or how it was found.

THE Vendôme Column has at length been restored to its former position, but the injuries due to its fall, and to the effects of neglect and wilful defacement, will require a prolonged process of restoration and cleaning before it will recover its former appearance.

A NUMBER of stained glass windows of the early part of the sixteenth century, which had been removed for safety from various religious houses to the Jesuits' College at Cologne, when threatened with sale by public auction under the Napoleonic régime, and had continued there ever since, have recently been placed in the sacristy, chapter-house, and north transept of Cologne Cathedral.

THE administration of the Luxembourg is at present occupied in transporting a certain number of the works of painters that have hitherto been included in its galleries, to the Louvre. By a wise arrangement the works of a deceased master of the French school cannot take rank in the Louvre until ten years after his death, when it

may be supposed that the prejudices of contemporary criticism will no longer affect the justice of the verdict. Thus it has happened that Horace Vernet, Eugène Delacroix, Ingres, Paul Delaroche, and several other masters who now belong to the past, were still to be found among the living French painters for whom the galleries of the Luxembourg are more especially reserved, a fact that often caused ignorant or facetious enquiries after their addresses to be made to the guardians of the museum. They will from this time be found in their proper places in the Louvre.

THE exhibition of Paul Baudry's paintings for the New Opera House closed on October 15.

AT a recent sitting of the Municipal Council of Paris the sum of 200,000 francs was voted for works of art to be executed next year for the city of Paris. "Ah! qu'il est loin," says *Le Gaulois*, "le temps où le même chapitre du budget dépassait 500,000 francs;" but we should be somewhat astonished in England to find our municipal authorities voting even 8,000*l.* for the purchase of works of art by contemporary artists.

As we often hear of the commission that is called upon to distribute the *commandes de la ville* to the various artists, sculptors, painters, engravers and medallists judged worthy of the honour, it may be interesting to learn the names of the members of this commission as it is at present constituted. They are: Members by right—MM. Ferdinand Duval, president; Alphand and Duc, vice-presidents; Bailly, Michaud, and Tisserand. Members nominated—MM. Perrin, Jobbé Duval, Delzant, Signol, Gérôme, Bonnat, Dumont, Guillaume Jouffroy, Gatteaux, Henriquel-Dupont, Labrousse, Marquis de Chennevières, de Longpérier, Haureau, Léopold Delisle, Clément de Ris, Merruau, Bouvard and Cocheris.

PILOTY's latest work represents a scene from English history—Henry VIII. repudiating Anne Boleyn. It has created a great sensation at Munich.

THE *Portfolio* for this month (October) contains the second part of Mr. C. T. Newton's learned article on "Greek Art in the Kimmurian Bosporos." It especially relates to the rich ornaments in goldsmith's work that have been found in the tombs and mounds. Several fine specimens of these, as, for example, the Melos necklace and earrings, may now be seen in the British Museum. A study of "Bough Structure," by D. Oliver, will no doubt be acceptable to many artists and amateurs who find pleasure and instruction in the pages of the *Portfolio*, the only art periodical in England that at all meets their wants.

MR. J. E. HODSON, A.R.A., writes from Geneva to the *Times* of Monday last, mentioning that the hand of the "restorer" has ruined what the Commune had spared in the case of two pictures in the Louvre. One is a Murillo, the other the *Marriage of Cana*, by Paul Veronese. Of the latter Mr. Hodson writes:—

"The *Marriage of Cana* stood alone among pictures; its enormous size enabled the painter to employ harmoniously all the resources of his palette; every note of the painter's gamut was struck; it contained, so to speak, a symphony in every key. Of colour in its highest sense there is now nothing left: instead of it, the painter's eye is struck by the crude aspect of familiar pigments. What was once of a lovely blue is now of an earthy green; the white draperies, the clouds, and the architecture, which used to be suggestive of the hues of opal, of silver, and of the pearl, now remind one of ashes and sand. Qui color albus erat nunc est contrarius albo. And as though the painter had intended to point out the completeness of the miracle of Cana, most of the wedding guests are depicted with vermilion noses. In fact, in the process of restoration, the painting has been ruthlessly rubbed down to its first coat."

THE Damascus correspondent of the *Levant Herald* calls attention to the unsatisfactory state of the Turkish law with regard to treasure-trove. No right to participate in his discovery is recog-

nised in the finder, who consequently melts or beats up priceless coins and artistic treasures, and attempts to sell them as old metal. Two instances are given, in one of which some coins were discovered among the ruins of an old house at Baalbec, and successfully sold by the finders, while in the other 100 Cufic gold dinars were unearthed near Zahley, and have been lost beyond hope of recovery. The writer suggests that the finder and the proprietor of the land on which the discovery takes place should each receive compensation in proportion to the intrinsic value of the objects found, while the objects themselves should become the property of the National Museum.

A CURIOUS incident has just caused considerable interest at St. Petersburg. It will be remembered that some time since M. Verestchaguine, the famous painter of scenes from Central Asia, refused the honorary title of Professor conferred upon him by the Russian Academy of Fine Arts. Shortly after, an academicien, a painter of some distinction, M. Tutrioumow, wrote to the *Monde Russe*, asserting that M. Verestchaguine was not the author of the paintings exhibited in his name, which were executed from his sketches at Munich by a company of painters formed for the purpose. This letter was answered in the *Voir*, first by M. Heinz, and afterwards by a formal protest, bearing the signatures of MM. M. P. de Klodt, Jacoby, Schichkine, Zabello, Hunn, M. K. de Klodt, Miassoiédow, Kramskoi, Tchistiakow, Popow, and Ghé. M. Tutrioumow has now written again to the *Monde Russe*, declaring that he had not charged M. Verestchaguine with any dishonourable conduct in attributing to himself works executed by others, as the greatest painters, and Raphael himself, did the same when engaged on works of large dimensions.

THE Leipzig *Tageblatt* states that the museum of that town has recently purchased for its sculpture gallery a fine statue of Adam, the work of the rising German sculptor Ad. Hildebrand, of Jena. The statue, as yet only modelled, is to be executed in the finest Carrara marble. It is spoken of by critics as being a great advance on the same artist's *Sleeping Shepherd Boy*, which attracted considerable notice some time ago.

FIVE pictures by Boucher have recently been discovered stowed away with their faces to the wall (in our opinion the best mode of hanging them) in an old country house at Charenton, in France. They have been rescued from their ignominious position and sold by auction, but only fetched very small sums. It is supposed that they formerly formed part of Philippe Egalité's collection in the château of Raincy.

THE American painter Constantine Kaiser has just died at Philadelphia at the age of fifty-two. He is best known out of the States by his very admirable frescoes in the restored parts of Speyer Cathedral, but since his completion of those works he has acquired an extended reputation among his own countrymen by his numerous decorative paintings in public and private buildings at Boston, New York and Philadelphia.

THE STAGE.

THE St. James's Theatre opened on Saturday night with a performance of opera bouffe, wisely selected in deference to the after-dinner tastes of the playgoers of the quarter. For everyday drama the St. James's Theatre is unhappily placed. No one lives in the neighbourhood who would go into the pit or gallery. It has therefore been sagacious to turn the pit into stalls, and to appeal frankly to club-land to come and see Miss Nellie Bromley and listen to light music. Club-land has responded to the implied invitation. But, before the opera-bouffe, there is what is called an eccentric comedy, which turns out to be a version of a well-known French piece, already played at the Gaiety under the title of *Too Clever by Half*. It is called *A Guardian Angel* at the St. James's

Theatre, and it has been described as an extravagant picture of the mischief worked in a peaceful family by a busybody who is suspicious and "well-meaning"—that is to say, stupid. It is a noisy little trifle—wants wild French acting, with the animal spirits of the Palais Royal, to carry it off—does not get this at the St. James's, and fails to make a mark. In it Mr. J. L. Hall makes his first appearance in London. He has a face with a good deal of expression, which, however, does not perform quite as much as it promises. Mr. W. Vernon, Mr. Morton, and Mr. John Rouse also take part in the piece, and so do two or three ladies—Miss Bessie Hollingshead filling a small rôle with grace and freshness.

The Black Prince—the important piece of the evening at the St. James's—is not indeed precisely what was expected—a new opera bouffe by Lecocq. The music is Lecocq's, the story Mr. Farnie's, but derived from a French source; but between the story and the music there was originally no connexion whatever, and the eminent composer has had no share in the enterprise now undertaken at the St. James's. The music is selected from his various works, unknown hitherto to the English public, and acquired for the St. James's, it is now stated, by purchase from his publishers. We are chiefly concerned here with Mr. Farnie's story, written for the theatre, and introducing melodies by Lecocq, which do not suffer in the hands of Mr. Chatterton, Miss Selina Dolaro and Miss Bromley. The slender thread of plot in the piece is briefly to the effect that a wealthy and vulgar tradesman not choosing to consent to the alliances which please his daughters, the daughters and their lovers intrigue to get him in their power. Thinking that he is visiting our new turret-ship *The Black Prince*, he is really in a vessel commanded by one of the lovers, and bound, they tell him, for Terra del Fuego. He demands to be put ashore; he incites to mutiny; he is threatened with punishment, and finally restored to peace of mind and comfort only when he promises to assent to the match he had opposed. A light enough story this, in all conscience, though of course its fun is incidental, and not easily to be told in a piece of newspaper writing. The main fault of the thing is not the lightness of the story, but its slowness of development. Only the third act is brisk by the proper action of the story. The first and second flag somewhat—in spite of a skating scene which doesn't quite rival the scene at Prince's—and they would flag much more were it not for the presence in these acts of the most laughable character in the production: a character, by the bye, that has nothing to do with the plot. Dr. Maresnest (played by Mr. Hall) is an antiquary who in virtue of certain Roman remains in the tradesman's garden, has a tender affection for the tradesman. He deposes the tradesman to read a paper on the remains before a society of *demi-savans*, and announces to the tradesman his election as a "corresponding member." With a credulity and simple faith worthy of an unoccupied enthusiast, he pronounces the tradesman's garden rake to be "evidently a spear of the Augustan era," and rejoices in the benefit which will result to Science by his discovery of a "rude cooking apparatus" which the unprejudiced mind decides to be a discarded coffee-pot. But his greatest triumph is the discovery of an "inscription," which reads to him as "Lar. es circ lat." He cannot satisfactorily get any further than "Lares," but naturally refuses to believe that the thing is none other than a fragment of an advertisement of the *Telegraph*, which, when seen in full, announces the "largest circulation in the world." The caricature of course is a wild one, but those who appreciate the investigation of the Pickwick Club into its founder's celebrated theory of Tittlebats will find it not without point. *The Black Prince*, despite its needless length, is very fairly rendered by the whole company, and excellently by one or two. Miss Selina Dolaro—known for her tasteful singing—plays one of the heroines with a quiet charm and

refinement not often associated with opera bouffe, and which, considered together with the sharpness of her repartee, inclines many to think her capable of real success in light comedy. However this may be, opera bouffe acting answers well with the public, and suits best for the moment "the humour of their idleness." Nor is it to be wondered at that opera bouffe pleases them, when an actress so artistic as Miss Dolaro, gives, as she does here, a delightful performance. Miss Bromley throws her habitual animation into a poor part, and has taken some good singing lessons; but she is not, and cannot be, as funny as when, in *Eldorado*, at the Strand, she sat and shivered, half pathetic, half mischievous, on the bench of the police station. Mr. Chatterton, the tenor from the Opéra Comique, sings his songs excellently; but his expression is, for the sailor that he represents, rather feminine—we do not say effeminate. When all is said, the piece affords much pleasure. It went, we noticed, much better the third night than the first.

THEY are playing a selection of English comedies at the Crystal Palace. There are to be seven representations in all, and the first—of the *Hunchback*—was given on Tuesday last. The pathetic heroine was acted by Miss Geneviève Ward, and the smart heroine by Miss Fowler. Mr. Creswick and Mr. W. H. Vernon formed a part of the cast.

THE performance of M. Serpette's *Broken Branch* has ceased at the Opéra Comique. The theatre passes into new hands immediately, and will re-open with a revival of Mr. Burnand's best known burlesque—*Leion*.

FOLLOWING the fashion which has made musical after-pieces more popular of late than the burlesque proper, the Vaudeville Theatre will produce this evening a little work which Mr. Reece describes as a "musical improbability." It will be called *A Green Old Age*, and will be strongly cast—both Mr. James and Mr. Thorne taking part in it, as well as Miss Roselle, Miss Bishop and Miss Richards.

Sweethearts—the new piece by Mr. Gilbert, in which we understand that Mrs. Bancroft and Mr. Coghlan are to be the performers—will be brought out at the Prince of Wales's on Saturday next, along with the revival of Mr. Robertson's first pleasant little play, *Society*.

THUS far during the present season the Paris theatres have produced no new piece of especial merit. The Vaudeville is entirely unfortunate, for there the failure of *Marcelle* has been followed by the failure of *Berthe d'Estrée*. This last work, brought out a few nights ago, and destined soon to be withdrawn—though destined also, it may be, to be read in the library—is the work of M. Henri Rivière, a writer who is not a professional dramatist, but the captain of a frigate. His work has little of the craftsman's method: much of the mark of elegant leisure. He has written in the *Revue des Deux Mondes* several meritorious stories, and the Théâtre Français, in the days when M. Thierry was director, produced one comedy of his, *La Parvenue*, which a tasteful public received with moderate approval. There was style in the work, but little light and shade, little power, little dramatic instinct. One woman's character traced sufficiently well, and careful writing from end to end—those were the merits of *La Parvenue*, and the critics find the same merits and the same faults in the new piece, *Berthe d'Estrée*. "Le style," says *Le Temps*, "est très soigné, mais ce n'est pas du style dramatique. On y sent à chaque ligne l'écrivain de la *Revue des Deux Mondes*, qui sait que sa prose passera sous l'œil sévère de M. Buloz. La phrase est alambiquée et les mots choisis. Les métaphores se poursuivent jusqu'au bout avec une correction qui ne laisse rien à désirer. Elles sont toujours dignes ou spirituelles. L'auteur a des sous-entendus de malice où ne saurait entrer que des lecteurs très distingués, des abonnés de la noble revue. Tout cela est orné, fleuri, non sans une certaine affecta-

tion de préciosité qui perce de temps à autre. Mais tout cela ne vit point. Ce sont des élégances de romancier; ce n'est point du style de comédie ou de drame." With this polished style, there is a brutality of subject which shows that the author has made Dumas *filis* his model. We mean that he has sought like Dumas to be audacious, but, unlike Dumas, has, save in his actual writing, forgotten to be artistic. For the treatment of the theme—which deals with the private miseries of two married people—has a crudity which Dumas would surely have escaped. The details themselves have a lack of probability. In Dumas's most audacious scenes, you feel, as a critic has well said, that given such people as he paints, all this would really happen. It is natural to the characters he draws to act towards each other with the same unbridled frankness with which he acts to the public. But M. Rivière's characters are every-day mortals, except that they are rather more foolish, and they certainly would never discourse with the unbridled ingenuousness of the heroes of Dumas.

ONE very strong situation—in the highest degree moving and dramatic for contemporary work—occurs in the new piece by M. Manuel, now acted at the Théâtre de Cluny. But it occurs in the third act, and nothing occurs in the first and second, and it has not been able to ensure the success of the piece, well as the one scene is acted by Laray. It is led up to by a dozen improbabilities to which the audience find it hard to reconcile themselves; and so *Faits Divers* will not very long remain on the bills of the little Théâtre de Cluny.

M. SARCEY's account of Mlle. Tallandiera, the new actress whose appearance at the Gymnase was waited for with impatience, is more favourable than that which we gave last week, though he admits that the actress does not equal the exaggerated expectations of the public, and protests that she would be better in drama than in comedy. "Nevertheless," he says, "you cannot see her without allowing that there is power in her." "On ne saurait la voir sans tressaillir à certains endroits. Elle finira par régler cette exubérance, qui vient peut être moins encore de son tempérament, que de cette sorte de furie qui s'empare des poltrons, le jour d'une première bataille. Ils se jettent dans la mêlée, et frappent d'estoc et de taille, sans savoir ce qu'ils font. L'excès de la peur les jette dans un désordre de bravoure, qui n'a pas de lendemain."

THE performance of two or three important things in Paris was announced for the last days of the present week. *Le Demi-Monde*, which the Gymnase has possessed till now, was to be played for the first time on the boards of the Français. Meilhac and Halévy's *Veuve* will be brought out at the Gymnase in the beginning of November, with Mlle. Pierson as the heroine.

FREDERIK PALUDAN-MÜLLER's new comedy—*Tiderne skifte*, "The Times are Changing"—was brought out with signal success at the Royal Danish Theatre on October 20. The interest felt in this work was all the greater because so many years have elapsed since the veteran poet wrote last for the stage.

THE last number of the *Saturday Review* has an article which will interest those playgoers who care to know in some detail about the Paris stage, though probably no two persons will be found to agree as to the verdict pronounced on individual actors. It surprises us a little, for example, to read of M. Delaunay as "the most brilliant actor of the Théâtre Français;" for Delaunay, like Favart, has seen his best days. It surprises us still more to read the words "a greater actress than Mlle Delaporte—Mme. Pasca for instance—would, etc., etc." Now Pasca has always appeared to us too much wanting in sympathy to be described as "great" in her art at all. She is conscientious and successful. Delaporte, unless most

of the Parisian critics are prodigiously mistaken, is very much more than that. But it is ungracious to quarrel overmuch as to points of detail with an article which on the whole presents a sympathetic and accurate view of the stage-doings of the last few months in Paris.

MUSIC.

THE special feature of last Saturday's concert at the Crystal Palace was a very fine performance of Schumann's seldom-heard symphony in C. The warmth of its reception by the audience is a proof of the degree in which appreciation of this long underrated composer is increasing in this country; for the symphony in question is not only the most characteristic, but the most difficult to be understood by average hearers, of the whole series which its author has written. The other orchestral pieces given were Beethoven's first *Leonora* overture, and Sullivan's bright and clever overture to *Marmion*, originally composed for the Philharmonic concerts, and first performed there in their season of 1867, and recently re-written and much improved. The pianist was Mr. Charles Hallé, who gave a masterly rendering of Mozart's greatest concerto—that in D minor, Mendelssohn's especial favourite—and also contributed two solos by Schumann. The vocalists were M^{me}. Otto-Alvsleben and Mr. Edward Lloyd. This afternoon's concert contains several features of interest. Foremost among these are Brahms's "Ungarische Tänze," arranged by their composer for full orchestra, and performed in this shape for the first time in England. A seldom heard symphony of Haydn's is also included in the programme; and Mr. Clinton, the successor as principal clarinet of the Crystal Palace band to the late Mr. Papé, will make his first appearance at these concerts as a soloist, in Weber's second concerto for clarinet.

MR. WALTER BACHE, one of our most sterling English pianists, and a pupil of Liszt's, gave a pianoforte recital at the Hanover Square Rooms on Monday afternoon last. Though an ardent admirer of the new school, Mr. Bache is none the less a devout worshipper of the "classics;" and his programme was a model of excellence in the variety of its selection. It included Mendelssohn's Fantasia in F sharp minor, dedicated to Moscheles; Beethoven's sonata, "Les Adieux, l'Absence, et le Retour;" and Bach's Concerto in D minor, with stringed accompaniments, as representative of the strictly classical school, while the "higher development" of piano playing was illustrated by selections from Chopin, Bülow, and Liszt. The performance was in all respects worthy of the music.

THE first meeting of the new "Musical Association," the recent foundation of which has been chronicled in these columns, is to be held on Monday next, at the Beethoven rooms, Harley Street. Two papers will be read, the one by Dr. Stone "On extending the Compass and increasing the Tone of Stringed Instruments," and the other by R. H. M. Bosanquet, Esq., on "Temperament, or the Division of the Octave."

THE detailed Prospectus of the Glasgow Choral Union for the coming season announces a series of sixteen concerts—four choral and twelve orchestral. At the former are to be produced Smart's *Jacob*, Brahms's *Song of Destiny*, Macfarren's *St. John the Baptist*, the *Messiah*, and Schumann's *Paradise and the Peri*; while the list of works to be given at the latter is too long for quotation. Among the composers to be represented are Haydn, Mozart, Beethoven, Mendelssohn, Schubert, Auber, Cherubini, Herold, Gade, Bennett, Macfarren, Gounod, Meyerbeer, Nicolai, Reissiger, Rossini, Sullivan, Spohr, Weber, and Wagner. The list of the orchestra, which will be led by Mr. J. T. Carrodus, comprises many well-known names, and the conductor of the whole will be Mr. H. A. Lambeth. So admirable a prospectus is in the highest degree creditable to the committee of the Union; and it

is to be hoped that they will meet with sufficient support from the public to induce them to repeat the experiment of a resident orchestra in Glasgow (now about to be tried for the first time) in future seasons.

SCHUMANN's only opera, *Genoveva*, which has lately been revived at several theatres on the continent, is shortly, it is said, to be also produced at the Stadttheater at Leipzig.

AUBER's last opera, *Le Premier Jour du Bonheur*, is announced to be produced this day, for the first time in Vienna, at the Komische Oper.

THE recent performance of the *Huguenots* at the Grand Opera in Paris, for the benefit of the inhabitants of Alsace and Lorraine, in which Adelina Patti took part, and in which she sang in French for the first time, realised the sum of 38,500 francs.

THE *Neue Zeitschrift für Musik* gives in its last number an interesting account of a Society for the Cultivation of Chamber Music which has flourished in St. Petersburg since 1872. Its special object is the production of seldom heard works. The list of compositions brought forward by the society during the two years of its existence nearly fills a closely printed column of the *Zeitschrift*, and is probably unique. During the first season fifty-six works by twenty-three different composers were produced; while last season the number was raised to sixty-seven works, thirty-nine composers being represented. Of the highest interest must have been the performance of several of Bach's concertos for unusual combinations of instruments. There is, probably, hardly a piece of chamber music of recent production, and of any importance, which is not to be found in the list. The *Zeitschrift* remarks that such a catalogue puts to shame many a German town; how much more, we may add, our unmusical, perhaps we ought rather to say inartistic, London!

A CORRESPONDENT writes from Vienna:—"The news which appeared in the columns of the ACADEMY, that Richard Wagner is intending to give some concerts, together with Abbé Liszt, in Vienna and Pesth, has been confirmed by a letter from Richard Wagner himself to one of the principal functionaries of our 'Wagner-Verein.' The composer distinctly states his intention of conducting a series of concerts on a similar grand scale to that held in Vienna in May 1872, and of employing the profits of all these concerts for the benefit of the Bayreuth Fund."

"THE management of our Grand Oper," writes the same correspondent, "already shows what benefits Viennese amateurs may derive from the liberty enjoyed by the former since the retirement of the 'General-Intendant.' The Opera, which for many years past has never had more than one novelty a year, and not always that, now announces no fewer than five novelties and quasi-novelties, which are all to be produced in the present season, namely: Gluck's *Iphigénie en Aulis* (first time at the New Opera); Goldmark's *Die Königin von Saba* (novelty); Gounod's *Le Médecin malgré lui* (new for the German stage); Richard Wagner's *Tristan und Isolde* (new for Vienna), and Verdi's *Traviata* (first time at the New Opera). Strange to say, the engagement of M^{lle}. Christine Nilsson, which has been negotiating for the last two months, is not finally settled yet. M^{lle}. Minnie Hauck, who has been for some years a member of our opera, will make her reappearance there in the second week of November."

THE great Scandinavian composer, Professor Gade, of Copenhagen, has received an invitation from the Musical Union of Birmingham to write a large composition for choir and orchestra, for the Festival of the Union in 1876. A similar invitation addressed to Mendelssohn led to the production of the *Elijah*, under the master's own direction, in 1846. It will be a capital opportunity for Gade to introduce himself vividly to the English musical public.

POSTSCRIPT.

AFTER long preparation, Mrs. Everett Green has at last been able to send to the press the first sheet of her *Calendar of the Domestic State Papers of the Interregnum*. The papers to be calendared are scattered in so many series that it has been thought advisable to separate the semi-political information contained in the Committee books from the more directly public matter which will form the subject of the present volume. The publication of these calendars will render accessible the materials for the history of a period of which perhaps less has been hitherto known than of any other of anything like equal importance.

ONE of the French Transit of Venus Expeditions has had rather a narrow escape. After the landing of the instruments and stores, the vessel which conveyed the party under M. Bouquet de la Grye's charge to Sydney caught fire, and the fore hold, from which the instruments had just been removed, was burnt. The ultimate destination of the party is Campbell Island, some five hundred miles to the south of New Zealand.

A second party arrived safely at Shanghai on August 18, en route for Tien-tsin, and the third has got as far as the Mauritius. Mr. Gill, on behalf of Lord Lindsay, has offered to lend twenty chronometers to M. Mouchez, the chief of this expedition, for the determination of the longitude of his station, St. Paul Island. This island does not offer a very inviting prospect, being a barren volcanic rock in the Southern Ocean, and exposed to violent storms which throw up on shore large quantities of wreckage, forming a supply of wood from which the observers hope to be able to build their huts.

A LARGE number of friends and pupils of Professor G. Curtius at Leipzig have determined to present him with a testimonial on the twenty-fifth anniversary of his professorial career. The money collected is to be employed for the foundation of a prize or scholarship, to be named the "Curtius Prize," for the encouragement of the study of the science of language. Contributions for the testimonial are received in England by Professor Max Müller, Parks End, Oxford.

No. 131, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Complete Works of George Herbert. In Three Volumes.

The Complete Poems of Christopher Harvey. Edited by the Rev. Alexander B. Grosart. (The Fuller Worthies Library, 1874.)

MR. GROSART'S sumptuous edition of George Herbert has obviously been in a special sense a labour of love; besides the "memorial introduction," which accompanies all his editions, there is an essay on Herbert's life and writings, and Walton's life is largely annotated; moreover, there are appendices giving what Walton says of Herbert elsewhere, and what Herbert's eldest brother, Lord Herbert of Cherburie, has to say of the whole family; and not only are there copious notes to all of Herbert's writings, but in the edition of Harvey the editor returns again to the charge with an interpretation of the poem "Jordan," which is difficult not so much in itself as because the connexion of the contents and title is obscure. Mr. Grosart complains, and with very much reason, that Herbert has never been properly edited; for instance, to go no further than the "Perirhanterium," the received text since 1674 has been—

"Constancy knits the bones and makes us tower," which is a corruption of the reading of the original edition,

"Constancy knits the bones and makes us stowre," which is an old word analogous in sense to sturdy, and probably a parallel form of it, while both the MSS. read—

"Constancy knits the bones and makes us *sowre*," which last Mr. Grosart is the first to print: it is a clear case of *potior est lectio difficillima*, especially as "sowre" is rather a pet word of Herbert's. In the same poem it is obvious as soon as pointed out that when Herbert says

"A proud ignorance will lose his rest
Rather than show his cards."

"Rest" is a gambler's term for a special stake, as in the well-known phrase: "Here will I set up my rest;" but until pointed out it is not obvious, and Mr. Grosart has been the first editor to point it out. It would be curious if we could ascertain whether the same metaphor is not pursued in the beginning of the next stanza,

"If thou be master-gunner, spend not all
That thou canst speak at once; but husband it,"

especially if it should turn out that the phrase of "setting the rest" is itself a metaphor from the arquebus practice of the day. Any way, "master-gunner" is a difficult phrase, and it would have been an advantage to know if Mr. Grosart's reading throws any

light upon it. It is more curious that he should have missed the point of

"Were I an epicure, I could bate swearing,"

which means, of course, "if I had no more belief in providential judgments than an Epicurean;" not, "if like the Epicureans I placed the chief good in sensual enjoyment."

In general it may be said that exegesis is not the strong point of this very interesting edition, and it would be possible to point out several mistakes in the translations from the Latin and Greek works of Herbert, which otherwise are as enjoyable as such things can be, and catch the seventeenth century tone very happily. But the fact is that until our seventeenth century writers have been systematically studied for at least a century, we cannot fairly expect to have them completely edited; the standard by which we ought to try work like Mr. Grosart's is the standard of a fifteenth century edition of a classic, and tried by this standard Mr. Grosart's work deserves nothing but praise.

To begin with, he has brought a great deal of new material to light from the Williams MS., including several new English poems, one of which, "Even-Song," is worth extracting, as it has all Herbert's characteristic beauties, though perhaps not quite his deepest fervour:—

"The Day is spent and hath his will on mee;
I and y^e Sunn have runn our races:
I went y^e slower, yet more paces;
For I decay, not hee.

Lord, make Thou my loss up, and sett mee free,
That I, who cannot now by day
Look on his dazing brightness, may
Shine then more bright than hee.

If Thou defer this light, then shadow mee,
Least that the Night, earth's gloomy shade,
Fouling her nest, my earth invade,
As if shades knew not Thee.

But Thou art Light and Darkness both together,
If that be dark we cannot see,
The sunn is darker then a Tree,
And Thou more dark than either.

Yet Thou art not so dark since I know this,
But that my darknes may touch Thine,
And hope that may teach it to shine
Since Light Thy darknes is.

O lett my Soule, whose keyes I must deliver
Into the hands of senceles dreams,
Wh^o know not Thee, suck in Thy beames,
And wake w^h Thee for ever."

There are two other pieces, "Love" and the "Holy Communion," which, though their literary charm is less, have a certain historical value as bearing on the course of Herbert's development. Beside these there are a collection of pointed and devout little poems entitled *Passio Discerpta*, and another called *Lucus*, and an earlier and independent text of most of the poems of the "Temple." Then, too, we have a biographical fact, not without importance, ascertained for the first time. Walton tells us that James gave Herbert a sinecure, which had been held by Sir Philip Sidney. Mr. Grosart has ascertained from papers preserved at Penshurst that this sinecure was the lay rectory of Whitford, to which Sidney was instituted (by his proctor) at the mature age of ten. This, of course, is a presumption of a kind in favour of Mr. Grosart's suggestion, that Herbert was still a layman in 1626, when Williams gave him the prebend

of Leighton Bromswold, which certainly would cut the knot which Walton vainly strove to untie. If Herbert was a layman this would explain why Walton could find no trace of his ordination; on the other hand, it is puzzling why, if he was still a layman, he was instituted to Bemerton with special facility, and had nothing to do but to provide himself with canonical clothes. Again, Mr. Grosart points out that Walton exaggerates the romance of Herbert's marriage, since the family of his father-in-law was so closely connected with that of his stepfather that it can hardly be believed that Herbert never saw his intended till three days before the marriage; and even if he had by accident missed seeing her till then, both parties must have felt as if they had known each other for a long time when they came to meet at last. On the whole, it is not unlikely that here, too, Walton was right in the matter of fact, because Herbert says that the country parson, if married, chooses his wife rather by the ear than by the eye, and with especial reference to her humility, upon which foundation a good husband can build up every other virtue; and it is natural to think that he is recommending to others a rule which he was glad to have followed himself. But though Mr. Grosart is probably over-sceptical in the matter both of the prebend and of the marriage, he has done very good service by insisting on the part of Herbert's life where Walton, though not uncandid, is remarkably discreet. He is the first serious critic who has given their due weight to the facts which Ellis summed up in the brutal epigram, that nature intended Herbert for a knight errant, but disappointed ambition made him a saint. Mr. Grosart's view is that Herbert was devout though proud, if not conceited, as a boy; that ambition led him astray almost as soon as he had entered at Cambridge, and made him consciously false to his true vocation and his higher self, and that the poems in the main belong to the time when he was painfully returning to his true life, either in his retreat in Kent, or after he had found peace in obedience at his country parsonage. This division is, as we shall see, too absolute, and hardly gives the conditions of the conflict quite accurately; but it is a merit to bring out clearly that Herbert's life was not homogeneous; that the courtly orator was a very different man both from the boy who went up to Cambridge glorying in the beauty of holiness, and the ethereal rector of Bemerton. According to Mr. Grosart, the poems might be compared to the flowers of the shore beyond the torrent; perhaps they might be compared to the stepping-stones on which he crossed it. The fact is, Herbert was an accomplished gentleman, of high spirit, weak constitution, uncertain health, and devout temper, whose mother, taking more account of the three last elements of the situation than of the first, determined that he should be a clergyman; and a clergyman he had to be, after a prolonged and half-hearted attempt that led to nothing, to establish himself as a courtier. There is no evidence whatever that he seriously thought of taking orders at any time between his appointment as public orator and the death of James I., though when he was a candidate for the

place he was naturally anxious to convince his family that he was not abandoning the career for which they intended him; in the same way even after his appointment he wrote to Andrewes in the tone of a proud man who had been advised to keep up a connexion that might be useful, and was at any rate creditable. The most we can fairly say of this period is, that he was willing to have two strings to his bow. Mr. Grosart dwells rather too much on some letters to his stepfather, begging for money to buy divinity. Herbert's allowance was limited; he abstained from real extravagance on principle, but his taste for dress was expensive, and he despised small economies on system; it is no wonder that he was constantly short of money, and when he had to apply for more it was quite natural that in perfect good faith he should lay stress on the item of his expenditure which he thought most creditable; and the letters fall before the date of his appointment as orator. There is no reason to suppose that the years when Herbert was mainly occupied with academical successes and attendance at court were years of conscious unfaithfulness to a higher calling, or of much inward conflict. The only conflict we have any reason to suspect from the poems or from Walton, is one caused either by his mother's persistent refusal to allow him to travel, or cut himself adrift from Cambridge, or by his own frequent ill-health and depression of spirits: the real conflict came later, when he saw that circumstances or Providence were against him, and that he should have to make up his mind to what he did not like.

Probably he was right in thinking, when the conflict was over, that he had found his true vocation. He had had considerable opportunities at Court, and, as we learn from Archdeacon Oley, his contemporaries had noticed that he did not make much of them. He had plenty of favour and reputation, but very little promotion: it is hardly fanciful to suppose that his inner life interfered with his outer, and that he was mistaken in thinking that he was strong enough to succeed in a Court career without really throwing himself into it. Mr. Grosart tells us that his letters on academical business do not compare favourably with those of his predecessor, Sir Francis Nethersole; the hyperbolic flattery is probably nothing but the misplaced ingenuity of a poet setting his imagination to coin an equivalent for the deference which his conscience does not refuse, and which he knows that the situation ought to inspire. The famous epigram on King James's works—

"Quid Vaticanam Bodleianamque objicis hospes?
Unicus est nobis bibliotheca liber."

is, after all, a too poetical way of telling the British Solomon that Cambridge would be glad to have a library like Oxford. To Bacon, when he presented his works, Herbert ventured to be intelligible, and suggested that the old library was the work of a former chancellor, and that it would be an honour to Bacon's chancellorship if it could be superseded by a building as superior to that already there as Bacon's works were to his predecessor's. For the rest, King James was both a clever and a learned writer, and as Herbert was fully penetrated with the

sincere reverence which in that day was felt for the kingly office, it was natural to think and speak of James's works in a way that surprises us, as the dedication to the *Idylls of the King* will surprise posterity if royalty is as much depreciated in the next two hundred and fifty years as in the last. That Herbert did not suppress his real feelings out of courtliness, comes out very curiously in his oration on the return of Charles from Spain. He begins with a burst of gladness at his having come back safe and single; he ends with a passionate obtestation that England loves him too well to let him go again; the rest is a clever Ciceronian exercise intended to prove that his going and coming back was quite an heroic and princely feat. All Herbert's classical work is clever and spirited and grotesque and rather heartless; there is a certain feeling for the spirit of antique art, with little or no respect for its limits. With the exception of the "Passio Discerpta" and the "Lucus," and the reply to the "Anti-Tami-Cami-Categorica"—which, if Mr. Grosart will allow us to say so, possesses, though in a very inferior degree, the merits of the *Anti-Jacobin*—it consists of academical show pieces, though even here the piety of the writer cannot be wholly repressed: he seldom writes twice to a courtier without wishing him eternal glory.

It is unfortunate that for the most part Herbert's Latin works are easier to date than his English, for the contrast in tone is a temptation against which Mr. Grosart has hardly guarded sufficiently to put all the English works, or almost all, after the Latin. From internal evidence it would probably be safe to put the "Perirrhanterium" tolerably early: one might fancy that it is the code that Herbert drew up for his own guidance at Royston, as the "Country Parson" is the code he drew up for his guidance at Bemerton. At all events, precepts like this—

"Slight not the smallest losse, whether it be
In love or honour; take account of all:
Shine like the sunne in every corner; see
Whether thy stock of credit rise or fall."

are more likely to come from a man who is sitting down to a game that he has studied, than from a man who has risen from the table and drawn his stake, because he had conscientious scruples or was not satisfied with his cards. Even here the thorough other-worldliness which was probably the deepest obstacle to Herbert's secular success comes out very strongly in the final stanzas. Other works which it is natural to class with the "Perirrhanterium" are the collection of "Outlandish Proverbs," and the translation of Cornaro's *Art of Long Life*. There is nothing very characteristic in the first: they might have been selected by any accomplished student who wished to commence man of the world at second hand; perhaps the most remarkable are the warning against a Latine-bred woman, twice repeated; the observation that the wars of religion in France made a million of atheists and thirty thousand witches; and another, which looks more personal, that he who will live safely must not look too deeply into things. It is hardly too much to say that temperance was a hobby of Herbert's at all times, and probably he found something not uncongenial in the self-complacency of the fine old octogenarian,

who made the pardonable mistake of supposing that everybody would have a constitution like his own, if nobody did anything to over-tax the digestion. Perhaps the two most remarkable things in the "Country Parson" are the undoubting confidence with which a man who had failed in one career laid his plans for beginning another; and that a standard of conduct which hundreds of obscure clergy now surpass should have been thought superhuman at the time.

To return to the poems, it is clear from internal evidence (e.g. "the Forerunners," where Herbert says of his own white hairs, that they are the chalk-mark of the harbinger sent by death, who will soon take up his quarters with him), that they stretch over some considerable time of his life. Sometimes, as in the "Forerunners," he thinks of the loss of his power of devising conceits as a subject for consolation if not for regret, sometimes as almost a matter for thankfulness. This gives us a criterion for dating the figurative and fanciful poems early, though the criterion is not infallible, as no conceit can be quainter than that of the "Forerunners" or "Aaron," which must date from the time when Herbert was in priest's orders. But perhaps we should be safe in putting things like "Prayer" and "Providence," and "Man's Medley"—perhaps, too, the "Posie" and the "Pulley"—among the earliest. In "Love Unknown," which is one of the latest, Herbert tells us that he offered his fruit from the first, before he gave his heart. The first poems on "Temper" and "Justice," may be early too, and "Submission" reads as if it was written when Herbert was still at Court, and vexed to see he was not getting on. Like most pious men, he began life with a quite sincere resolution to give up his own will to a higher, and like most pious men he had to give it up over again, when he found the two did not coincide.

Will not Mr. Grosart give us a popular edition of Herbert's poems in approximate chronological order, and perhaps his second thoughts upon their quaintnesses? It is rather tantalising to be referred to the taste of the age: Donne, Herbert, and the rest, are all very individual personal writers, who worked for themselves, not for the public. Is their over-ingenuity an expression and instrument of relief at the subsidence of over-wrought perplexities of feeling that found no rational outlet in life?

Of Christopher Harvey there is little to say, except that Mr. Grosart has proved that Christopher, and not Thomas, is the author of the *School of the Heart*, a series of Herbertesque exercises on a Dutch book of emblems, which record no graver crises than any man may experience who is given to feeling his spiritual pulse, and that the *Synagogue* has accompanied enough incorrect modern editions of the *Temple* to have a sort of right to accompany a correct one.

G. A. SIMCOX.

Histoire de la Guerre Civile en Amérique. Par M. le Comte de Paris. Vols. I. and II. (Paris: Michel Lévy Frères, 1874.)

FAITHFUL to the tradition of solid respectability with which the last three generations

of the Orleans family have invested their name, the Count of Paris has used his experience of certain episodes of the civil war in America, not, as might be expected from a young soldier after his first campaign, in a mere record of personal adventure, but as a peg for the compilation of a serious seven-volume history of the whole war. Of this work, the two first volumes, with an Atlas, are now published. So short a period has elapsed since the close of the struggle between North and South, that it would perhaps be too much to expect an impartial review of the causes which brought it on, and of its phases, military and political, from a native pen. Wonderful as has been the control which both parties have exercised over the passions called forth by four years of internecine strife, since the curtain fell on the last act of the drama, those passions were too deeply roused to be forgotten, at least until all the actors have passed away. The present and the next generation must probably content themselves with reading both sides of the question, and drawing conclusions for themselves, unless effectual assistance is afforded them by a foreigner. The Count of Paris had thus a great opportunity; but any hope that may be raised of dispassionate treatment of his subject, in its political aspect at least, will at once be dispelled by a perusal of the opening paragraph of his book:—

“Au commencement de l'année 1861, un de ces actes de violence que les ambitieux savent souvent déguiser sous des noms d'autant plus beaux que leurs motifs sont plus coupables, vint déchirer la république des Etats-Unis, et y allumer la guerre civile.

“Un coup d'état fut tenté contre la constitution de cette république par la puissante oligarchie qui régnait dans le Sud, et avait longtemps dominé dans les conseils de la nation. Le jour où la loi qui assure également à l'individu pauvre et isolé le respect de ses droits, et à la majorité la pleine jouissance du pouvoir politique, est violée par une fraction quelconque de la société, le despotisme est fondé, si cet attentat n'est sévèrement réprimé. Battus dans les élections présidentielles de 1860, les Etats du Sud voulurent ressaisir, par l'intimidation ou la force, l'influence qu'ils avaient exercée jusque-là au profit de l'esclavage, et tout en faisant sonner bien haut les mots d'indépendance et de liberté, ils foulèrent aux pieds un contrat sacré, dès que le scrutin national se prononça contre leur politique.”

No apology is necessary for this extract, giving as it does the keynote to the tone which the Count of Paris adopts throughout in discussing every part of his subject which has the most remote bearing on politics. This complete inability to see in the Southern cause any fraction of reason or justice, anything better in the people who sacrificed their all in the struggle, than vulgar revolutionists swayed by a selfish oligarchy, or in their opponents aught but motives of exalted patriotism, appears at first sight marvellous in an educated foreigner. Though the Count of Paris cannot be expected to forget that he lost a throne by one revolution, he might remember that his grandfather gained it by another. On second thoughts, however, it is easy to see that thoroughgoing partisanship is a deduction that might be inferred from the author's position. It is impossible to suspect so exalted a personage of joining in a civil war in a foreign country from mere

“gaîté de cœur,” and desire to flesh his maiden sword. A mere soldier of fortune might do so; but not the Count of Paris. Indeed, soldiers of fortune, who fight for the fun of the thing, are out of fashion now-a-days. Blind enthusiasm and profound sympathy for the cause espoused are expected from everyone who joins in other people's quarrels, whether as Carlist or Republican, Papal Zouave or Garibaldian franc-tireur. In the political part of his subject, therefore, the Count of Paris must be looked upon as an advocate, or an apologist, rather than an historian; and we therefore pass with pleasure to the more strictly military portions of his work.

The first book, occupying a third of the first volume, is devoted to a careful history of the American army. A study of this, the Count of Paris justly remarks, is absolutely necessary to the comprehension of the war. The volunteers of the eighteenth century, and of the war 1812–1815, in spite of the cohesion they obtained by a series of campaigns against regular troops, cannot be considered as having reached the rank of an organised army; and thus the real army of America only dates from the peace of 1815, and the establishment of the Military Academy at West Point.

Even in this comparatively remote period of his subject the writer never lets slip an opportunity of a sneer at the South. He goes out of his way to tell us that the Northern states, who were afterwards faithful to the Union, supplied more than three-fourths of the Army of Independence. In the absence of statistics of population this is obviously no foundation for an argument; but supposing this lukewarmness of the Southern states to have really existed, would not a candid historian rather see in it an indication that even then they felt that their own interests and those of the North were by no means identical?

The account which follows of the constitution of the American army and its campaigns between 1815 and 1861 is clearly told and interesting, though the author appears unaware that the military institutions he describes are but a reproduction of the British original even in its defects. The absence of a staff corps, the division of the duties of the Etat Major between the Quartermaster-General's and the Adjutant-General's departments, and the presence of three field-officers with each battalion, the last attributed to the exigencies of frontier warfare, are all characteristics of our own service; as is the denial to generals of power to punish commissioned officers without a court-martial, which seems to the author so destructive to discipline. The system of promotion is identical with that which prevailed in the army of the East India Company.

The next three chapters are devoted to the Mexican campaigns and the Indian wars, which latter are oddly characterised, perhaps with some faint idea of comparison with Algeria, as fulfilling “la plus belle mission du soldat.” Equally singular is the reflection that a “just Providence,” in bringing the white man to America to replace the red, brought at the same time the horse, whose aid enables a scanty remnant of the aborigines to prolong their resistance.

The second book, entitled “La Sécession,” describes the actual outbreak of war, and includes a somewhat unnecessary chapter on slavery, and two very good ones on the raw material available as food for powder on either side. Here again we find the same inveterate prepossessions spoiling otherwise good work. The very excellences of the Confederate soldiers are attributed to moral defects, and the adherence of the Southern chiefs to the admitted maxim that to take the initiative in attack is often the best defence, is laid down to experience of the inferior tenacity of their men. On the other hand, the faults of the Federal volunteers, though by no means glossed over, are studiously dwelt on to enhance the merit of their ultimate success.

An elaborate sketch of the rivers and railways in the theatre of operations, which afforded to both sides such extraordinary facilities for carriage, and which, especially the former, so largely influenced the character of the war, occupies the next chapter and completes the introductory matter.

However partial a guide the Count of Paris may appear in matters of opinion, in matters of fact, as might be expected, his candour leaves little to be desired.

The earlier episodes of the war are far less interesting to the military student than the later campaigns, and this instalment of the history, extending to the spring of 1862, includes only events which, important as they appeared at the time, paled into insignificance in the light of the subsequent years. The series of blunders on both sides which resulted in the rout of Bull's Run is graphically told, and is followed by an account of the reorganisation of the Federal army under McClellan, and of the war material used by either party. This concludes the first volume.

The second opens with the Missouri campaign, mainly remarkable for the first appearance of Grant as a general in the half success of Belmont. Of still less consequence were the series of indecisive skirmishes in Kentucky which closed the military operations of 1861. In the meantime McClellan, having spent three months in organising the Army of the Potomac, had found his feeble attempts at an advance checked by the sharp defeat inflicted on his right wing at Bull's Bluff. The Count of Paris does not hesitate to criticise his old commander for the over-estimate of the number of his adversaries to which he ascribes his hesitation at this period. McClellan had 75,000 men disposable for an advance into Virginia, while Johnston could not have opposed him with more than 45,000.

The navy of the Union, as has been pointed out by Colonel Chesney, has rarely received credit for its share in bringing the war to a successful conclusion. Its condition on the breaking out of hostilities, the capture of Port Royal, and other minor events on the coast, serve, with an account of the Confederate privateers, the blockade runners, and the Trent affair, to fill the long chapter that concludes the third book.

The greater part of the fourth is taken up with the series of operations in the west which pushed back the Confederate line of defence to Memphis; and the most interest-

ing chapter of the present two volumes is undoubtedly that which recounts the bloody and indecisive two days' struggle at Shiloh and Pittsburgh Landing. Both in the story of the fight and his reflections on its effects the Count of Paris shows commendable impartiality. To the Confederate Generals, Sidney Johnston and Beauregard, he justly gives credit for the first recognition of the truth that the way to gain a solid victory is to attack and destroy the enemy's army, a lesson which was promptly taken to heart by the Federals. Before Shiloh both sides had limited their efforts to the attack and defence of numerous scattered positions, without any attempt to bring on a decisive action. Occasional errors in figures hardly, perhaps, amounting to misrepresentations, but always on the same side, are occasionally noticeable. At page 323 we are told that the Federal loss at Fort Donelson amounted to 1,500 men *hors de combat*, and the Confederate to 2,000. Two pages further on Grant's loss is stated at 2,041, and that of the Confederates at an equal figure. Again, it is hardly fair to include 4,500 Confederate cavalry in the attacking force at Shiloh, where from the nature of the ground cavalry was useless, while excluding the division of Grant's army, 7,000 strong, which lay at Crump's landing, only seven miles off, and actually arrived on the ground as well as a division of Buell's army before the close of the first day's fight.

Operations on the coasts during the first months of 1862 bring the volume to a close. Each is accompanied by admirably executed maps and plans of the sites of the various battles. Altogether, though there is much that is interesting and creditable in this first instalment of the Count of Paris' work, he cannot lay claim to be doing more than adding another to the Federal histories of the war.

O. B. ST. JOHN.

MAZDEISMUS REDIVIVUS.

Christianity and a Personal Devil. An Essay by Patrick Scott. (London: Basil Montague Pickering, 1874.)

THE continuous dismemberment of ancient orthodoxies in the present day offers at times strange phenomena, often of little importance in themselves, but so curious as to deserve attention from all who love to follow the fluctuations and capricious currents of religious opinion. While some vigorous minds, still under the charm and influence of the ancient dogmas, defend valiantly the whole edifice, although its walls are crumbling and green with age; others hold passionately to one particular point of the ancient belief, on which they take their stand, willing to abandon all the rest. One cares little about the Trinity, provided that the Atonement be preserved. Another talks like a Rationalist of the resurrection of the body, but sees no salvation for those who deny original sin; some entertain the hope of the final conversion and restoration of the damned, but forbid us to touch the supernatural inspiration of the Scriptures, for all, say they, is lost if you meddle with that.

This narrow field, in which the champions are constantly firing upon each other, is very

unfavourable to orthodoxies—we say orthodoxies, because they are many. In fact, such is the tendency of the age that it accepts eagerly all the concessions made to its rational exigencies, and listens without much interest to the arguments in favour of the particular doctrines which one after the other are brought forward as containing the very heart and marrow of religious faith. In this way all the principal points of the old Protestant orthodoxy have been defended, one by one, by special apologists against the assaults of criticism, without producing any sensible modification in the chances of the main battle in favour of the orthodox party.

It is impossible, generally speaking, to explain the motives which induce the advocates of some special points in the old orthodox religion to pronounce themselves in favour of one favourite dogma rather than another. The choice chiefly depends on individual subjective causes, such as would be called, in medical language, "the *idiosyncrasy* of the apologist." In other cases it often happens that, obliged to defend his favourite doctrine against arguments which were quite unknown to the old theologians, the advocate thinks it advisable to transform it and to introduce into it elements which would have made the old theologians start with horror; and as timid men when forced to face danger often surpass the bravest by their reckless daring, so some minds still bound in the chains of traditional doctrine allow themselves, while thinking that they are defending it, to take such hazardous leaps that they frighten even the most emancipated theologians.

We find a remarkable specimen of this double phenomenon in the book whose title we have placed at the head of this article. In the opinion of the author, Mr. Patrick Scott, the vital doctrine of Christianity is the recognition of a personal Devil. Beware of disputing this doctrine as against common sense, experience, and all healthy conceptions of God, of the world, and of humanity, or of simply ignoring it as indifferent. Mr. Patrick Scott clings, with every fibre in his being, to his dear personal Devil. Without the Devil there can be no more sanctification, no more internal peace, no assurance of salvation, no Bible, no Christianity, no anything. Pius IX. is not more infatuated with his infallibility, Dr. Cumming with the approach of the Millennium, a ritualistic clergyman with his candles and embroidered chasubles, a Catholic nun with the adoration of the Sacred Heart, or a Mormon with polygamy, than Mr. Patrick Scott with his personal Devil. It is his fixed idea, his hobby. I might almost say that he is in love with it, so valiant is he against all who tarnish the glory or diminish the greatness of his favourite.

But there is more to come. An idea which has not been proclaimed by any defender of his Infernal Majesty for centuries, and which will certainly shock all who still believe in his personal existence—for it is equally revolutionary, anti-biblical, and, we may add, anti-divine—a heresy against which all the anti-gnostic fathers fulminate their anathemas—this idea is accepted by Mr. Patrick Scott with cheerful alacrity and

without disguise. He owns that his faith in Satan would be vacillating if he continued to imagine him in conformity with the generally received opinion—that is to say, as a rebellious *created* being, turned out of Heaven as a punishment for his pride, plunged into the abyss with his accomplices, and able, in consequence of the Divine permission, to torment men with his malice throughout their lives. It seems to him that if we take this view, Satan would accuse the Deity of being Himself the author of evil, and consequently of gross injustice in punishing sins that He Himself had caused. According to Mr. Patrick Scott, Satan is an *uncreated* being, possessing great powers independently of the Divine will, and interfering with the world in order to corrupt and turn it aside from the purposes of the Supreme wisdom. The history of humanity, especially that of its moral and religious development, is above all others that of the struggle between two *uncreated* powers. The incarnation and the redemption derive their necessity from the conflict between these two great powers, and our only ground of confidence amidst the terrors which the thought of being ourselves the stake in such a terrible duel must inspire in us, is that there is good reason for believing that the power of God is in reality greater than that of Satan, and that in the long run the latter will be conquered. Mr. Patrick Scott cherishes, with a complacency which does honour to his charitable feelings, the hope that all the vassals, small and great, of the infernal power, whose fault chiefly consisted in having deserted the service of their legitimate sovereign to enrol themselves in the army of the Prince of Evil, will, in the end, experience the effects of the Divine mercy, and return to the sovereign whom they ought never to have denied. This book, therefore, which at first sight seemed written for the purpose of vindicating a much-contested orthodox doctrine, and of avenging the innumerable insults which it receives every day, gradually resolves itself into a nest of heresies.

There is a proverb which says that "Hell is paved with good intentions." I much fear that Mr. Patrick Scott's book may be one of these paving-stones. No doubt it is full of good intentions; but, as the honest writer considers the disbelief in a personal Devil as a more pernicious heresy than any other, and likely to increase the number of diabolical agents, it is much to be feared that his apology will consign many souls to perdition. If we must choose between the negation of a personal devil and the affirmation of an uncreated devil, our hesitation will not be long. For this theory is as contrary to the Bible as it is to reason; it is evidently the dualistic theory which asserts the power of God, the absolute Being, to be limited by another power originally and essentially independent of His own. We all know that the Bible is profoundly and rigorously monotheistic, and philosophy insists upon the Unity of the First Cause as its most incontrovertible postulate.

We will not follow Mr. Patrick Scott through all the details of his argument. We have mentioned the characteristic thesis,

and this is enough.* The ultimate result for us and all who like ourselves are revolted by the idea of a personal Devil, while maintaining firmly the belief in God who is the Author of all life, without whose will nothing exists, is that we have a perfect right to sustain that the traditional devil, the rebellious archangel, the great hunter of souls in the presence of the Eternal Being, is as inadmissible from the point of view of an enlightened religious faith as it is from that of philosophical reason. These reflections do not prevent our being somewhat startled at the sight of this earnest, thoroughly convinced man—a great believer in the authority of the Scriptures, and thoroughly orthodox in intention—who, in the hope of raising an impenetrable defence round his favourite dogma, can think of no better means than to adopt blindly a monstrous heresy. Without intending to exaggerate the importance of this phenomenon, it may be regarded as one of the signs of the times, for it is one

* As, however, Mr. Patrick Scott has taken as his starting-point the paper published by me, and translated into English under the title of *The Devil; his Origin, Greatness, and Decadence* (London: Williams and Norgate, 1871), I may be permitted to notice some of his refutations. He seems to have read this historical essay superficially. For instance, he attributes to me an interpretation of the First Epistle of St. Peter, chap. v. verse 8, which is by no means indefensible, but which is not mine, and belongs to the translator in his prefatory notes. In another place he charges me with saying that Jesus, when He spoke of the Devil, accommodated Himself to popular notions which He knew to be false. I never said anything of the kind, but simply that the doctrine of Jesus, in its principles and direct applications, tended to relegate the idea of Satan to the domain of symbols, and thus to deliver the religious conscience from the burden of the belief in a personal Devil. In another place I am accused of committing the enormity of asserting that the belief in a personal Devil diminishes the sense of individual responsibility. "That is," replies Mr. Patrick Scott (p. 99), "if a friend should tempt me to commit murder or any other crime, he will suffer for it and not I." I suppose, however, that in such a case a jury of just men would share the guilt between the tempter and myself. I have besides had the simplicity to think that, if one believes in the personal Devil, one must also believe in sorcery; and, as sorcery is now exploded, the belief in the Devil is likewise rejected as untrue. In my turn, I ask my adversary on what ground he denies the possibility of sorcery. However he may interpret the Bible, it admits the existence of sorcerers (Exodus xxii. 18; 1 Samuel xxviii. 7; Acts xii. 9, xiii. 8; Rev. xiii. 13-15, &c.); and in truth, if one believes in the personal existence of Satan and in his constant intervention in human affairs, there is not a single valid reason for denying that he may specially reveal himself to men who desire to serve him, and may bestow supernatural powers upon them; one may even assert that if he exists he can, and if he can, he will do so.

I may add that Mr. Patrick Scott has generally understood neither the premisses nor the tendency of my essay. A stranger evidently to biblical criticism, his notions on the dogmatic authority of the sacred books are very different from those with which I began to sketch the history of Satan, making use of the Scriptures just as one does of other ancient historical documents. Nor does he feel the force of the argument, which, in the name of the philosophy of history, one has a right to oppose to a dogma which one can trace from its source through its development to its decline, while showing the logical connexion which has led the human mind by degrees from the one to the other. These are the means by which one discovers whether a doctrine is still living and fruitful, or whether it has accomplished its term, is exhausted and at the point of death. After having long made the world tremble before him, Satan has nothing more to say for himself, but is gradually disappearing below the horizon.

among the many facts which attest the discomfiture of the orthodox party. It is no longer a dismemberment but a dissolution.

The strange thing is that Mr. Patrick Scott has never asked himself, when endeavouring to found this belief in the Devil, in what degree his dualism would interfere with the belief in God. For instance, how will he satisfy with such a thesis those minds which seek for their chief support and consolation in the almighty power of God the Father? It is evident that this hope which "shall not be confounded" rests not only on the love but on the omnipotence of Him on whom it is grounded. Perfect faith in God requires the conviction that no being, no power in Heaven or Earth, can escape from His supreme authority, that all existence, that of Satan himself, if he exists, flows from His absolute existence. If, on the contrary, I am to admit that the universe is the joint work and the theatre of two uncreate and hostile powers, you will in vain tell me that One is more powerful than the other, and that consequently that One will gain the final victory: I am by no means reassured by your assertion. I see that in truth the efforts of the spirit of evil have from the very beginning been crowned with splendid success, and that he has tormented the human race from its origin, and that in spite of the redemption his influence has scarcely diminished; I anxiously ask myself, therefore, what warrant there is for believing in the final triumph of the principle of good? Even the promises in the Bible cannot subdue my fears, for on this theory they emanate from the rival of Satan, and every general promises victory to his soldiers, without these promises preventing them from being beaten. Mr. Patrick Scott's serenity is not in the least disturbed by his own assertions; but when I examine his grounds for security, involuntarily I recollect the question addressed by M^{me}. de Luçay to her husband when he answered for the irreproachable conduct of M^{me}. de Maintenon, even when she was young and beautiful, the wife of the cripple Scarron, and intimately acquainted with Ninon de l'Enclos: "How is it then, Sir, that you are so sure of that?"

One black spot, however, disturbs the tranquillity of Mr. Patrick Scott: it is lest he should be accused of Manicheism, and he struggles to show that if like Mani he recognises two uncreate and antagonistic powers, there are radical differences between his doctrine and that of the Persian Magian. We will not dispute this point with the advocate of the uncreated Devil; that he is not a Manichean we are willing to concede, and we will give him his certificate to that effect. But with the same impartiality we declare to him that he is a downright Mazdeist, and that his pretended Christian theory is nothing but Mazdeism slightly tinged with Christianity. If he became a disciple of Zoroaster, he would have little to change in the essential features of his system. While he imagines that he is submitting with docility to the doctrines taught in the Bible, he has succeeded in inserting the Zend Avesta in our Scriptures. Let our readers be the judges. In Mazdeism, Ahura Mazda (Ormuzd) created the world and mankind, but Ahriman

(uncreate like himself) has corrupted the work of the benevolent Deity, seduced the first human couple under the form of a serpent, and never ceases disputing with Ormuzd the empire over the human soul and will. This is not, as in the Jewish and Christian traditions, a limited evil power, governed by an all-powerful will, which could at any time destroy it if he thought fit; but a power independent in its origin, and able to endanger the rival power. Mazdeism affirms, indeed, that in the long run the strength of Ormuzd will overpower that of Ahriman, that good will triumph over evil, that a great final purification will cleanse the world from all stain, and that Ahriman, seeing all his slaves torn from him, will submit himself to the dominion of his brother Ormuzd. I ask Mr. Scott what essential difference is there between his principles and those of Mazdeism? Mazdeism possessed its redemption, its Saviour, its last judgment, and all its morality consisted, like that of Mr. Scott, in this maxim, "Remain the faithful servant of Ormuzd, resist with all thy strength the seductions of Ahriman." The names alone are changed. Tertullian said that Satan was the "ape of God." Mr. Patrick Scott makes him His brother.

To sum up, this book will not add a single recruit to the belief in the Devil; but Protestantism may henceforth boast of numbering a Mazdeist in its ranks. The phenomenon in our day is so strange as to deserve a notice in the ACADEMY.

ALBERT RÉVILLE.

History of the Infirmary and Chapel of the Hospital and College of St. John the Evangelist at Cambridge. By C. C. Babington, M.A., F.R.S., F.S.A. (London: George Bell & Sons, 1874.)

IN the twelfth century, and some decades at least before the University era, there existed at Cambridge an institution known as the Hospital of St. John the Evangelist. It was at first nothing more than a small wooden edifice for the reception of a few sick and infirm persons, but towards the close of the century it was placed under the management of a body of Augustinian canons, and a stone building with an oratory was erected. This erection probably sufficed for the requirements of the canons, but towards the latter part of the following century an attempt was made by Bishop Balsham to render the foundation subservient to what was then quite a novel university conception, by introducing a body of secular scholars—that is, of students who were simply designed to recruit the ranks of the secular clergy. The new comers and the regulars at the Hospital quarrelled sadly, and the good bishop soon made up his mind that it would be better to remove the seculars to a separate foundation, and hence the commencement of the most ancient Cambridge college, that of St. Peter, with its rule borrowed from Merton College, Oxford. It was very probably in order to meet the increased demand for accommodation occasioned by the introduction of the seculars that a new chapel, a building distinct from the Hospital, was erected. But however this may

have been, it is certain that the old chapel of St. John's College, which has given place within the last few years to the present splendid structure, was originally an erection of the thirteenth century. Its earlier characteristics, it is true, had well-nigh disappeared in a series of alterations, especially those of 1514, when the Hospital had given place to a college; but when, a few years ago, the building was pulled down, these original features were brought to light. At the same time, also, a group of college rooms, familiarly known as "The Labyrinth," was removed, and these in turn disclosed a number of interesting details in what had formerly been the infirmary of the Hospital. Fortunately, before it was too late, the attention of Professor Cardale Babington and other highly competent investigators was directed to both buildings, and in the present volume the Professor has given us the results of their examination, together with a collection of photographs which preserve much that is interesting to the architect and the antiquarian. In the infirmary were discovered a series of early English lancet windows and a beautiful double *piscina*, since removed into the new chapel. In the chapel itself numerous features, principally belonging to the Early Decorated and Perpendicular styles, were exposed to view, which at the time when it was sought to adapt the building to college use had been materially altered, mostly, it would seem, for the worse. Of all these discoveries Professor Babington's volume supplies an exhaustive and interesting account, and a full description of the present new chapel gives completeness to the volume.

The new chapel, as is well known, is a gorgeous specimen of Early Decorated, the same style as that in which the old chapel was originally built, and in his introductory chapter Professor Babington endeavours to justify the seeming inconsistency involved in reverting to a style so long anterior to the age in which the college was founded. The most valid defence would perhaps be to suggest, that as there is good reason for supposing that the old chapel was originally built in order to meet the increased demands occasioned by the introduction of Bishop Balsham's secular scholars in 1280, and inasmuch as the college founded by Bishop Fisher in 1511 represented the ultimate triumph of the principle which his predecessor had sought to establish, there was a certain appropriateness in reverting to the style of the ancient structure. Professor Babington, however, goes much further than this, and argues that

"although the body existing under the present charter was founded by that charter on April 9, 1511, it is nevertheless as completely a continuation of the much older community which went by the name of the Hospital of St. John the Evangelist, as are our present municipal corporations of those which existed in the Middle Ages, for they have been several times dissolved and re-incorporated, yet their continuity is never disputed."

We much doubt whether the parallel he here institutes has any value; for while the ancient corporations when re-incorporated still professed to serve the same purposes as those for which they were first

instituted, in the case in question, when, in 1511, the Augustinian canons were compelled to make way for Bishop Fisher's scholars, the whole character and purpose of the institution was entirely changed. When, therefore, Professor Babington goes on to say that St. John's College was "a body endowed with the property and rights and burdened with most of the duties of its predecessor," he seems to write under some misapprehension with respect to the rule of the earlier foundation. The Augustinian canons, who took their rise about 1109, unlike the secular canons, were essentially a monastic body; so much so indeed that we find Penot, the historian of the order, in his *Historia Tripartita Ordinis Canoniorum Regularium* (I. 38, n. 4), asserting that it would be quite as correct to speak of them as monks. The houses of the order were subject to the rule of St. Augustine as prescribed by Innocent II. at the Lateran Council of 1139, and a comparison of this rule as given by Desnots in his *Canonicus Saecularis et Regularis* (a rule which must be carefully distinguished from that of the earlier canons contained in the *Codex of Miraeus*), with Bishop Fisher's statutes for St. John's of 1516, as edited by Professor Mayor, will show that there was the greatest dissimilarity. In fact, the college from the very first was an anti-monastic body; and almost from the time when Earl Harold founded his college at Waltham for secular canons—and not, as Mr. Freeman has so clearly pointed out in his *Norman Conquest*, for monks—there is to be discerned a struggle between the monasteries and friaries, on the one hand, and the secular clergy on the other, in connexion with the education of the times, which constitutes, perhaps, the most important and interesting feature in our early university history. Every college as it rose was a kind of challenge to the monastic foundations; a challenge first thrown out at the universities by the creation of Merton College at Oxford, with its famous *regula Mertonensis*—a rule as different from that of the regular canons as could well be. And just as the seculars and regulars at Cambridge in the thirteenth century found it impossible to get on together, so at Oxford in the fourteenth century we find them alternately expelling each other from Canterbury Hall. The dogged opposition with which Bishop Stanley endeavoured to frustrate the design of his stepmother, the Lady Margaret, after her death, in connexion with St. John's College, represents the monastic bigotry of his day in conflict with its enlightened liberalism as exemplified in men like Fisher, Shorton, Ashton, and Hornby, inspired by the genius of Erasmus. In arguing for a real continuity between the old Hospital and the new College, Professor Babington, indeed, seems scarcely aware how directly he is controverting Baker, the historian of the college, whom he frequently quotes:—

"And so," says this authority, "the old house, after much solicitation and much delay, after a long and tedious process at Rome, at Court, and at Ely . . . was at last dissolved and utterly extinguished, and falls a lasting monument to all future ages and to all charitable and religious foundations, not to neglect the rules or abuse the

institutions of their founders, lest they fall under the same fate."

But in fact it is no more correct to speak of St. John's College as a continuation of the Hospital, than to say that Jesus College was a continuation of the nunnery of St. Rhadegund. The relation of these two colleges to the communities which they displaced is totally different from that which Trinity College, for instance, bore to Michaelhouse, or even from that in which Christ's College stood to God's House, for in the latter case it is easy to discern a development of the original design, inasmuch as a foundation for students in the first branch of the *Trivium* was simply enlarged to one for the whole arts course of study.

While, therefore, gratefully acknowledging the service Professor Babington has rendered to St. John's in the care and ability with which he has illustrated an interesting chapter in its architectural history, we fear that the claim which he implicitly sets up on behalf of his college as the most ancient foundation in the university, is one which can scarcely be maintained.

J. BASS MULLINGER.

Tenures of Land and Customs of Manors, originally collected by Thomas Blount, and republished, with large Additions and Improvements, in 1784 and 1815. A New Edition, by W. Carew Hazlitt, of the Inner Temple, Barrister-at-Law. (London: Reeves & Turner, 1874.)

BLOUNT's *Jocular Tenures*, originally published in 1679, has long been the standard work of reference for all those who are desirous of knowing what were the old feudal services in consideration of which the kings granted the lands to their barons. Though the statute of Charles II. abolishing the incidents of feudal tenures has done away with many of the old services, yet the exception in that Act reserving the honorary tenure of grand and petit serjeanty keeps alive even to the present day various obligations, which, if the holders of the lands that owe them were suddenly called upon to perform them, would most likely create the greatest consternation, not only to the tenant, but also to the lord. If, for example, the present holders of the three yard lands at Aylesbury granted to William de Aylesbury "by the serjeanty of finding straw for the bed of our Lord the King, and to straw his chamber, and by paying three eels to our Lord the King when he should come to Aylesbury in winter, and also finding for the King when he should come to Aylesbury in summer, straw for his bed, and moreover grass or rushes to strew his chamber, and also paying two green geese,"

were called upon to do this, we do not know who would be the most astonished, the tenant who rendered the straw and eels, or the Queen to whom they were rendered.

Mr. Hazlitt has, as he tells us, made certain changes in this book, arranged the contents alphabetically, revised the notes, corrected the errors, and added some hundred new articles. We wish Mr. Hazlitt had gone a little further, and endeavoured to classify the contents of the book. As it is, freehold and copyhold tenures, grand serjeanty and petit serjeanty, customs and traditions, are

all mixed up together, without any attempt at arrangement. A book that would show as nearly as possible how far the custom of primogeniture prevails in England, how far Borough English extends, what are the different manorial customs, what are left of the feudal services, would be a most valuable addition to the literature of our Land Laws.

We have endeavoured to classify the tenures given by Mr. Hazlitt under the letter A, and we find, speaking roughly, nine cases of grand serjeanty, ten of petit serjeanty, five copyhold, besides several tenures, such as knight service and castle guard, which were abolished by the statute of Charles II. If this had been done throughout the book, its usefulness would have been much increased. It would also have been an improvement to the book if Mr. Hazlitt had informed us which of the services due at the coronation of the King were claimed and allowed at the coronation of George IV. We find in several cases notices of those that were claimed and allowed at the coronations of James II. and George III., but no mention is made of that of George IV. These services in grand serjeanty, to do some act for the King at his coronation, are far more numerous than is commonly supposed: the popular idea is limited to that of the champion Dymock, as Lord of the Manor of Scivelesby, in Lincolnshire, challenging, in the words of the herald's proclamation:—

"If any person of what degree soever, high or low, shall deny or gainsay our Sovereign Lord King of England, Scotland, France, and Ireland, Defender of the Faith, son and next heir to our Sovereign Lord the last King, deceased, to be right heir of the Imperial Crown of this realm of England, or that he ought not to enjoy the same, here is his Champion, who saith that he lieth and is a false traitor, being ready in person to combat with him, and in this quarrel will adventure his life against him on what day soever he shall be appointed."

But in addition to the Champion, there are various other landowners who claim to do certain acts at the coronation in respect of their lands. Thus the lord of the manor of Liston, in Essex, claims to make and place five wafers before the King as he sits at dinner on the day of his coronation, and to have the instruments of silver and other metals used as his fees. The Earl of Surrey claims as such to carry the second sword before the King. The Beauchamps, Earls of Warwick, claimed to bear the third sword before the King, and to be panterer at the coronation. Sir Hugh de Nevill held the Manor of Wethersfield, in Essex, by the service of setting the first dish at the King's right hand on the day of his coronation, and was to have the dish and towel for his fee. The lord of Winfrith, in Dorsetshire, holds by the service of giving water for the hands of the King on the day of his coronation, and is to have the bason and ewer for this service. The lord of the manor of Fingreth, in Essex, claims to be the Queen's Chamberlain on the day of the coronation, to have the Queen's bed and furniture, and the basins, &c., as his fee. The honour of Worksop was held by the tenure of finding the King a right hand glove at his coronation, and supporting the King's right arm on that day as long as he

should hold his sceptre in his hand. The manor of Wyndley, in Hertfordshire, was held by the service of being the King's cup-bearer, and at the coronation dinner carrying the King his first draught of drink in a silver-gilt cup, which was the lord's fee for his service. The Lord Mayor of London claims, with twelve of the citizens, to assist the chief butler in the butlership, to serve the King with wine after dinner, and to have the cup the King drinks out of as their fee.

This list might be multiplied to an indefinite extent. Many of the services here mentioned have been claimed, but not allowed, and it is extremely doubtful which of them are now in existence; but it would be interesting to ascertain what lands in England are still held by the obligation of doing personal service to the King at his coronation. One curious point in the ideas of our forefathers is well illustrated by the tenures mentioned in this book—namely, that it was considered an honour to do any personal service for the King, however menial. The manor of East Ham in Essex was held by the tenure of being caterer of the King in his kitchen; the manor of Finchfield by the service of turning the spit at the King's coronation; the manor of Bray, in Berkshire, by the service of serving our Lord the King with his boots (is this the origin of the Baron of Bradwardine's tenure, as narrated in *Waverley*?); the manor of Sherfield in Hampshire by being "*mariscallus de meretricibus*" (we give the original Latin not to shock our readers), and by the service of dismembering malefactors condemned, and of measuring the gallons and bushels in the King's household.

There is one other example given by Madox in his *Baronia Anglica*, not mentioned by Mr. Hazlitt, which to our mind would be the worst of all. John Baker held certain lands in Kent by the service of holding the King's head in the ship between Dover and Whitsand when he went over the sea there. Imagine the King's feelings if a tenant holding in grand serjeanty, armed at all points, on being called upon to do his service turned out to be a bad sailor!

The services in petit serjeanty and the copyhold customs are equally curious with those of grand serjeanty. In the last, the copyholds, we find customs that are relics of the old community of ownership of land at the time when individual property was the exception, not the rule. As we have stated, nothing would be more interesting or important than a classified list of English tenures. In this book Mr. Hazlitt had the opportunity of giving it us, and we regret exceedingly that he has not availed himself of it: he has only given us a revised edition of a standard work instead of a book that would have inseparably associated his name with the question of land tenure. This is still more noticeable from the fact that Mr. Hazlitt states that

"the general tenor and instruction of the book will be that our *ancient* landed gentry, in return for certain privileges and exemptions, acknowledged certain substantial obligations and duties; our *modern* landed gentry retain the privileges and exemptions, but the equivalents have fallen into desuetude. This constitutional anomaly has become

one of the questions of the day, and may at any moment start into a prominence only surprising to those who *won't* see."

Before bringing this charge against the modern landed gentry, it would have been as well if Mr. Hazlitt had told us what proportion of the substantial obligations and duties to which he refers have fallen into desuetude. We fancy, if he went into the matter carefully, he would find a far larger number of the honorary services as to the freeholds, and of the customary services as to the copyholds in existence, than he fancies; as to those that have become extinct, the Crown has been no loser. The incidents of feudal tenures were not abolished without ample compensation. The sum James I. asked in exchange for the surrender of these rights is greatly exceeded at the present day by almost every branch of the excise which in the reign of Charles II. Parliament granted in lieu of the substantial obligations to which Mr. Hazlitt refers.

J. W. WILLIS BUND.

A History of Advertising from the Earliest Times. By Henry Sampson. (London: Chatto & Windus, 1874.)

DR. JOHNSON and Mr. Puff were not of one mind with respect to advertising. They were agreed that it had risen to the dignity of a science; but while the former believed that it had in his day attained to perfection, the latter maintained that it could have been noway complete until the advertisers were taught by himself to inlay their phraseology with variegated chips of exotic metaphor. Standing at the distance of a century from these authorities, we see how far they were from understanding that, when they descried the portent, it was not yet even mewing its mighty youth, nor had begun to purge and unscale its sight at the fountain of heavenly radiance. But since their days the science has advanced so rapidly as to excite wonder that historians have hitherto thought it unworthy of notice. History has been so long talking of its dignity, and declaiming from its high cothurnus that it has ignored the truth that folly is an institution more lasting than the overgrowths of human nature which are its ordinary subjects; and that while governments, armies, churches, literatures, and systems of commerce are necessarily finite, error and stupidity are in their nature eternal. The gull's hornbook will never be out of print. That respectable capitalist M. Robert Macaire and his eminent friend M. de Saint-Bertrand will outlive judicial misfortunes and political persecutions. The Chevalier des Adrêts will, as of old, find the professions all before him where to choose; he will still set companies on foot with enormous advertisements, enormous placards, enormous promises, then realise the capital, pocket it, put the key in the door, and pass gaily through the Bankruptcy Court; still appear on 'Change, and cause the funds to fall by learning that the Queen of England has the whooping-cough, and that the cholera is at Paris: still negotiate bills of the Maison Bertrand, conduct matrimonial agencies, plead the causes of rogues, sell his facile pen, deal in prohibited wares: and will finally be drawn in his carriage by

a mob of enthusiastic admirers, receiving apotheosis for his political, literary and commercial integrity. Those who would write the story of puffery need not be moved thereto by indignation. The world loves to be told of its amiable weaknesses, and the place of the satirist is occupied by such genial chroniclers as Mr. Sampson or Cluvienus.

In the method of his book Mr. Sampson has taken a hint from the judge who, in recommending a wordy counsel to set his remarks in order, bade him not even despise alphabetical order. Mr. Sampson's arrangement is for a while chronological, but at last he wearies of this and abandons system altogether. Though professing to trace to their source both oral and documentary advertisements, he has scarcely succeeded in penetrating the mist which envelops the origin of most institutions. He barely names the heralds of the heroic ages, messengers of gods and men and dear to Zeus himself; and he dismisses as lightly the criers of Rome, a race in such demand that their despised profession became respectable, and its members found place in the cushioned seats of the Equites, and were preferred in marriage to the leaders of law and letters. He gives a table of rude inscriptions found on the walls of Pompeii, but being doubtless warned by the researches of Mr. Pickwick among less ancient monuments, he does not attempt to decipher the greater part of them; and it is, therefore, reasonable to infer, we may note in passing, that his strictures on the Pompeian schoolmaster who chalked on his garden-wall a false construction for which an English schoolboy would have been caned, are founded on a mistaken reading of the words. Passing in review the bellmen, wine-criers, and *sergents à verge* of the Middle Ages, we are brought to the period when the centre aisle of St. Paul's Cathedral was the market for cheapening ecclesiastics, and the place for affixing the advertisements of such persons as had a mind to serve in the nature of gentleman ushers, on the ground that they had little legs of purpose and a suit of their own; or of those who entertained the most gentlemanlike use of tobacco and were skilled in the tricks called the Cuban ebolition, euripus and whiff; or of others who were disconsolate for the loss of a little mayden childe of the age of thirty yeares and upwards. At last Houghton came. Houghton, it seems, is the father of modern advertising. He published a weekly paper in which he undertook personally to recommend his clients, or to set forth their needs as his own. At one time he wanted a complete young man that would wear livery and wait on a very valuable gentleman, but declined to be suited unless the young man could play on the flute. At another he demanded a genteel footman who could play on the violin; or a young man that could write a pretty good hand and go to market, who had had the small-pox, and could give security for his honesty. With Houghton the historical survey might end, but there are stray advertisements which by reason of their associations could fitly be placed in this category. In 1660 John Milton was modestly announcing the publication of a tractate on Free Commonwealths, while the King was

issuing a proclamation from Whitehall to recover a dog with a streak on its brest and tayl a little bobbed. In 1679 bills were posted for the apprehension of the men who assaulted John Dryden in Rose Street, Covent Garden. And in 1709 ladies were informed that if they had any particular stories of their acquaintance which they were willing privately to make public, they might send 'em by the penny post to Isaac Bickerstaff, Esq.

In the miscellaneous advertisements here collected the hand of the cynic and the humourist is sometimes visible. But he advertiseth best who loveth best all things both great and small, and who has a fund of fellow-feeling with burglars and thieves. Thus in 1798 a benevolent being presented his compliments to the gentlemen who had done him the honour of eating a couple of roasted chickens, drinking sundry tankards of ale, and three bottles of old Madeira at his house on a certain night, and after enumerating the tankards, table spoons and guineas to which they were welcome, merely asked them to restore a few loose papers which could be of no use to his friendly visitors. In the same spirit an American gentleman gave notice that if the person who took away his overcoat was influenced by the inclemency of the weather, the advertiser was satisfied: but if by commercial considerations, the advertiser was ready to negotiate for its return. How different from the malevolent disposition of the churl who wanted immediately, to enable him to leave his house in the plight and condition in which he found it, five hundred live rats, for which he would gladly pay 5*l.*, stipulating at the same time that the rats should be full-grown and no cripples. And how different, too, from the selfish ingenuity of the Ohio tradesman who undertook to supply Ministers of the Gospel with goods at cost price on the condition that they mentioned the fact to their congregations. But in brevity and grimness of humour all these must yield to the principal of Flushing Institute, who wrote shortly thus: "Dear Boys—Trouble begins September 15."

The advertisements relating to marriage, whether in the *ton* or city style, disclose many such curiosities as the application of a fair creature anxious to borrow money, who announced that the security might be very agreeable to a single gentleman of spirit. The registers purchased by Government in 1821 showed that certificates of marriage were often antedated to please the parents of the wedded couple, that persons were described as half-married because they said they were married enough, and that others were so described because they would pay no more than 3*s.* 6*d.* But none of the advertisements which we have quoted contain that largeness of promise which is the essence of the puff. "We do not live in an age of harmony," said Macaire aforementioned; "il faut du bruit, beaucoup de bruit." Here is a man undertaking to cure the maddest person in three months, a woman proclaiming herself the first and only person to have found out the nature of bugs, a surprising person who promises to change himself into a rattle, a dwarf no bigger than a tavern tobacco-pipe, a girl with a body of

different colours and admirable unusual growings-out: and here in the period of masquerades is Signor Rosario, who would teach the gentlefolk the behaviour proper for a devil, a courtesan, or any other character; and Ann Field, of Stoke Newington, well known for her ability in boxing in her own defence, who having been affronted by Mrs. Stokes, styled the English Championess, did fairly invite her to a trial of the best skill in boxing; and his sacred Majesty, King Charles II., who in 1664 declared it to be his royal will and purpose to continue the healing of his people for the evil during the month of May. Few of these could have understood the modesty of the makers of American Balsam, who advertised their wares with the motto, "No hair, no money."

These are fair samples of an industriously compiled book of quaint conceits. They are not remarkable for wit, nor do they show ingenuity of a high order; but they will doubtless afford reasonable amusement to the curious. That the collection would have been vastly improved by condensing the garrulous comments which accompany each advertisement, by omitting the diffuse circulars of betting-men, and supplying their room with extracts from other continental papers than recent numbers of the *Figaro*; and that the annals of quacks, jugglers, wizards, buffoons, lottery-office keepers, impostors, and empirics would have been embellished by reference to the distinguished French and Italian professors of puffery who were dead centuries before Mesmer and Cagliostro appeared, we are not disposed to deny. There is not a sound of the drums, flutes, fifes, hautbois, trumpets, and tambourines which dinned in the ears of the plumed cavaliers, farded ladies, soldiers with long rapiers, pages, lacqueys, dancers, marionnettes, pick-pockets, and beggars who formed the human tide surging through the alleys of the Foire St.-Germain, the cradle of modern advertisements. There is no mention of the deities who presided at the infant's birth. They were known to men as Barry, Orviétan, and Tabarin, and held their court on the Pont-Neuf at Paris. Here they established their pretentiously-ornamented stages, their violinists, clowns, and negro attendants, and hawked their ointments, balms, oils, extractions, quint-essences, distillations, and calcinations. Here the joyous Tabarin narrated the adventures of Captain Rodomont and the intrigues of the beautiful Isabelle, being dressed in roomy pantaloons, on his shoulders a riding-cloak, in his belt a wooden sword, round his neck a long gold chain, and on his head the fantastic hat which he kneaded like wax. Here assembled the tooth-drawers under the leadership of Thomas called the Great, who made his patient kneel on the ground, seized on his tooth, and raised man and tooth three times in the air with the strength, it is reported, of a bull. Here, beside the famous bronze horse, played those merry comedians of the street, Gaultier-Garguille, Gros-Guillaume, and Turlupin, rivalling the performances of the Hôtel de Bourgogne. Here the setting sun of ingenious charlatanism shed its last rays on the prologues, paradoxes, fancies, and pleasant imaginations of Jean Farine and Bruscambille. And of all these worthies an

account should be rendered by the writer who professes to compile a complete history of advertising.

WALTER MACLEANE.

CURRENT LITERATURE.

The Life of John Holland. By W. Hudson. (London: Longmans & Co.) This is rather a clumsy memorial of a man worth remembering; the compiler has been rather overwhelmed by the mass of materials put into his hands ready calendared. When a fact struck him as significant he put it down, however trivial; perhaps it was the best he could do, as he had no power of penetration and abstraction: when he thought anything irrelevant he has never managed to pass it over in silence. Still, when we have worked through the book we feel that we do know the man. Mr. Holland was the son of a maker of optical instruments, born at Sheffield Park in 1794; he lived till 1872. For a time he continued to help his father in his business, and gradually got literary work, beginning with the poet's corner of local papers, and after about twenty years of that, during the last seven of which he had filled James Montgomery's place as editor of the *Sheffield Iris*, he was made Curator of the collection of the Sheffield Philosophical and Literary Society. The post, which he held till his death, forty years after, made him feel independent, though latterly, when he was over seventy, some gentlemen of the neighbourhood subscribed to give him an annuity of 100*l.*, in case his infirmities should compel him to resign the appointment. Two of his volumes of verse reached a second edition; a manual of metallurgy which fills three volumes of Lardner's *Cabinet Cyclopaedia* is favourably spoken of; he wrote a good deal of local history, both topographical and personal, that was well received; and he enjoyed life thoroughly and thankfully, and was held in honour among his own people. The only drawbacks to his happiness were that he had a very scanty education; that the first lady whom he wished to marry married some one else; that her sister to whom he transferred his affections died; that a nephew to whom he was attached was drowned; and that Sheffield got a little tired of him at last, and forgot to ask him to the last Outler's Feast he lived to see. We cannot count it a misfortune that he survived Montgomery, since he lived to write his memoirs in seven octavo volumes, and the loss was replaced by the really touching correspondence with Miss Collings, a lady who translated the Psalms into verse and saw something in the sky, she could not get astronomers to agree with her what, about which she opened a correspondence with Sir John Herschel. Holland wrote a book about all translators of Psalms in Great Britain, and so got into a correspondence with Miss Collings that was kept up on the most friendly terms for many years, though they never met but once, when Holland was already old. He ascribed his happiness to his having had the resolution to give up all desire of wealth and distinction; it may be questioned also whether his want of education was an unmixed misfortune. He had real tunefulness and endless fluency as a versifier, and though his verses look careless, he tried several metres to see which would suit his subject best. But intensity of feeling is a gift rarely given to a diligent and healthy man, who leads a pious and uneventful life of hard work, and perfection of form is only to be attained by an instinctive fastidiousness which literary training would doubtless have given to a man of Mr. Holland's intelligence; while the price might very likely have been that he would have ceased to write at all what it delighted him to write, and what many read with an entirely innocent pleasure. It is to be hoped, though hardly expected, that Mr. Hudson's painstaking volume may be the occasion of thirty or forty pages which will live. If Mr. Arnold should ever desire to write a palinode in honour of "Provincialism," Mr. Holland would furnish him with a capital text.

Darkness and Dawn. A Russian Tale. By Annie Grant. Two volumes. (London: Hurst & Blackett.) The pictures of South Russian life drawn by the author of *Darkness and Dawn* are by no means unattractive, and a good deal of information may be gleaned from her pages with respect to the costumes of the peasantry, the conversational powers of the servants, and the characteristic features of the landscape in that part of Russia in which the scene of the story is laid. A note-book which was intended to supply the foundation for a book of travels has perhaps been turned to account for the purpose of furnishing a romance with "local colour." Moreover, the ladies who are brought upon the stage appear to have been, to some extent, sketched from life. But the heroes are a little unreal. The leading figure is a serf "with the head of an Alcibiades," whose marriage with the enthusiastic though strictly-educated heroine naturally places her in a position of discomfort and peril, from which nothing but the emancipation is capable of delivering her. The story is not so dramatic as *Oulita*, nor so forcible as *The White Slave*, but it is not devoid of interest, and it serves to point the moral that no young lady ought to marry a man, however handsome, without obtaining from him satisfactory information as to his social position.

THE Maid of Orleans. By G. H. Calvert. (New York: Putnam.) Perfectly tame, polished, and wooden: there is a monk (of Luther's order) who is in love with Jane, and the Bishop of Winchester and the Duke of Bedford plot her death, as if they did not honestly believe her to be a witch.

PAYNE'S Select Poetry for Children. (London: Lockwood & Co.) The eighteenth edition of this deservedly popular collection has been enlarged by well-chosen specimens from Tennyson and the Brownings, and other recent poets. Has Blake been found too childlike for real children? It is a pity that Mary Lamb's "Mock Hero" should be still assigned to Mrs. Leicester. Was the editor thinking of "Mrs. Leicester's School"?

The Retreat and other Poems. By P. Alford. (London: Simpkin, Marshall & Co.) "The Retreat" is a sort of metrical "Friends in Council," with all the humour and insight left out; the blank verse is related to the "Idylls of the King," as Hoole's *Tasso* to Pope's *Iliad*. The whole book is full of perfectly futile culture; almost the only fresh and genuine things are two little poems, "Nature and Duty" and "Duty and Nature," setting forth the shifting moods of a country parson; even these are commonplace.

Hymns and Sacred Lyrics. By Godfrey Thring. (London: H. S. King & Co.) Many of Mr. Thring's hymns have found some considerable acceptance in popular hymn-books. His models are for the most part the *Lyra Germanica* and the Ambrosian hymns: he is always clear, earnest and inoffensive, both in diction and metre, and, now and then, as in "St. Thomas" and "Questioning," we come upon stanzas which are almost poetry; but the real value of such religious verse is that it shows us the points at which traditional beliefs are still able to strengthen themselves by striking fresh roots in men's spontaneous feelings.

Penelope and other Poems. By Allison Hughes. (H. S. King & Co.) At present Allison Hughes is chiefly distinguished from scores of other cultivated writers of graceful and feeling verse by a predilection for the metrical effect of a long line, especially an anapaestic line followed by a shorter line in the same metre rhyming to it.

Mary Desmond and other Poems. By Nicholas Gannon. (Samuel Tinsley.) These poems have a "fatal fluency" about them. There is some poetical feeling, but it is so cumbered with a redundancy of words, that by the time it is pruned it is scarcely worth having. The first poem, "Mary Desmond," is a simple and pathetic Irish story of

the potato famine: had it been set in simple language, it could not have failed to touch us, but in many places it is wordy and stilted. There is some interesting Irish research in "Columba, the Dove of the Cell," but perhaps the best poems in the volume are "The Phookas' Revel," and "The Bridal of the Water King." Mr. Gannon does best when he keeps to Irish subjects.

The author of *Misplaced Love: a Tale of Love, Sin, Sorrow and Remorse* (Samuel Tinsley) hopes that the critic will accord to this work "sufficient merit to enable him to occupy a place amongst our minor singers." We do not know what our minor singers would say to such company, but we do not think they would like it. At any rate they would tell the author of *Misplaced Love* that minor singing does not consist in wrong spelling or the omission of every letter that makes a word inconveniently long, as—

"The father pity, sorely tried,
And pray to God that he
May've grace sufficiently supplied
In all this misery.

Poor thing! poor thing! said Lady Grey
Ther waiting maid that night,
Oh! ne'er again to see I pray
So very sad a sight."

What is the meaning of

"Dappled herds depasturing in the vale"?

and of a picture that "*beautifuller* grew." And is this sort of verse likely to win the coveted place?—

"Her father then with trembling hand
A-patting her did say
Entreatingly with kind command,
'Oh! speak not thus, I pray.'"

Or even this higher flight, which is as good as anything in the book, and says of Love:—

"As strong its power, as that which turns
The errant comet back;
As pure its fire as that which burns
Along that comet's track."

Brief Chronicles in Verse is a very unpretending collection of verses, chiefly political, by an elderly gentleman who thinks that the age of English poetry passed away with Pope, Byron, Scott, and Burns, and that this is the age of poetasters. What can criticism do, after such an appeal as this?—

"Even poetasters in the starry crowd
May by good-nature sometimes be allowed,
Who little theme in little verse indite,
And give to little folk a mild delight.
For them, the critic may his shaft suspend
And smilingly their little work commend;
Bid them rejoice in their own orbit small,
And stroke them smoothly ere to sleep they fall."

By all means let the author rejoice as much as he can in "his own orbit small;" he has good cause to do so, when he can produce such verse as the following, and bravely print it—

"Rome beheld with gloating gaze,
Gloating gaze—gloating gaze—
Chanting peans in its praise,
Death's ally, the mitrailleuse.
Worthy of the cause it propped,
Cause it propped—cause it propped—
His prey the Papal Tiger dropped
When Valour mocked the mitrailleuse."

But the author can do better than this when he leaves politics alone and writes about Dalmeney, Hurstmonceux, and "the Ballad Singer."

EDITOR.

NOTES AND NEWS.

THE new edition of Professor Bosworth's quarto Anglo-Saxon Dictionary will be an entirely new book, rewritten from beginning to end, and with full quotations and translations of passages. Under the names of authors, as of Caedmon—and places, like Brunanburg, the Dictionary will contain short accounts of the writer and his works, and of

the positions of the battle-places, &c. The whole of the work is ready for the press, and is printed as far as *ceorlisc*.

MESSRS. MACMILLAN will publish before very long some collected papers of the late Dr. Anstie as "Contributions to the Study of Nervous Disorders, Alcoholism, and Heredity." They will be edited by Dr. Thomas Buzzard, "with some account of the lamented writer."

WE understand that Mr. Pater is to continue his short aesthetic studies of Shakspeare's Plays in the *Fortnightly*, the present month's one on *Measure for Measure* being the first of a series that will some day make a book.

H. R. H. PRINCE LEOPOLD has announced to Mr. Furnivall his intention of presenting to the members of the New Shakspeare Society the Parallel Text edition of the two first quartos of *Romeo and Juliet* which Mr. P. A. Daniel has edited for the Society.

DR. C. M. INGLEBY has generously presented a copy of his *Still Lion*—which is an attempt to found a science of interpretation of Shakspeare's text—to every member of the New Shakspeare Society, on the committee of which he is.

ONE of the most remarkable additions of historical interest made to the British Museum last year was the original manuscript of the Memoirs of Sir John Reresby, last Governor of York, and "Parliament man" for that city during the reigns of Charles II. and James II. The printed version of these memoirs turns out on comparison to be a mere paraphrase of the original, the plain matter-of-fact English of the long-headed Yorkshire baronet not having suited the taste of his unknown first editor. Moreover, at least one-half of the most interesting matter was never printed at all. This includes, besides new historical points, a long and curious account of the Reresby family for many generations, and abundant details of Sir John's own early life, education, and private relations with great families of the day. We understand that a literal and complete edition of these memoirs has been undertaken by Mr. J. J. Cartwright, of the Public Record Office, and will be brought out early next year.

WE understand that Mr. E. B. Nicholson, Librarian to the London Institution, is preparing new editions of Mandeville and Gower. The former, which may be looked for in 1875, will be illustrated with copious notes; the phraseology will remain unaltered, but the spelling will be sufficiently modernised to render Mandeville acceptable to general readers. Gower will also be annotated—for the first time; the text will be wholly reconstructed from an extensive collation of MSS.; and, besides the "Confessio Amantis," the edition will include the "Praise of Peace," at least one inedited English poem attributed to Gower, and his extant French poems.

M. VICTOR BONNET, the well-known French economist and contributor to the *Revue des Deux Mondes*, is preparing a second edition, with considerable additions and changes, of his work, *Le Crédit et les Finances*. The new edition is expected to appear at the end of the year.

IN his preface to his edition of Milton's *Poetical Works*, just published, Professor Masson informs us that Colonel Chester has discovered the burial register of the young physician Charles Diodati, the hero of the "Epitaphium Damonis." He was buried at St. Anne's, Blackfriars, August 27, 1638.

WE hear from the Rev. W. S. Lach Szyrma, vicar of Newlyn St. Peter, Penzance, that a few truly Cornish words, and the Cornish numerals up to 20, still linger in the memories of a few of the old people of the labouring and lower middle-class in his parish. This parish is old St. Paul's, and in it is Mousehole, where lived Dolly Pentreath, according to tradition the last speaker of Cornish as her native language.

WE hear of a forthcoming treatise on the Language and Versification of a Contemporary and Rival of Shakspeare, Samuel Daniel. It is by a candidate for the degree of Doctor of Philosophy at Bonn. The more such books the better.

PROFESSOR DELIUS, during his holidays in Switzerland this summer, wrote a dissertation "On the Original Text of *King Lear*" for the next volume of the German Shakspeare Society. The Professor is now lecturing at Bonn on the History of English Literature five times a week, on Shakspeare's Life and Works twice a week, and on Dante's Life and Works twice a week.

PROFESSOR MASSON opened the session of the Edinburgh branch of the New Shakspeare Society on Thursday. The members of the Branch Society propose to study *As You Like It*, *King John*, and *Lear* this session, and to have readings, papers, notes and queries, &c.

MESSRS. LONGMANS announce for publication in November—Earl Russell's *Recollections and Suggestions of Public Life*; Mr. J. Gairdner's *Houses of Lancaster and York*; Mr. S. R. Gardiner's *History of England under the Duke of Buckingham and Charles the First*; Mr. Swinbourne's *Picture Logic*; *Christabelle: a Tale of Christmas*, by Aura; Mr. A. G. Butler's *Charles I.: a Tragedy*; A. K. H. B.'s *Landscapes, Churches, and Moralities*; Dr. Hartwig's *Aerial World*; the first part of Mr. J. Orchard Halliwell's *Illustrations of the Life of Shakespeare*; Mr. Proctor's *Transits of Venus*; and the second volume of *Hume's Essays*, edited by Messrs. Green and Grose.

PROFESSOR RUSKIN's next four lectures at Oxford will be on the School of Florence: Giotto, and his predecessors and successors. Mr. Ruskin's previous lectures have been on the Geology of the Alps, supporting the late Professor Forbes's view of a rending force producing cleavages, and against Professor Tyndall's of the gradual working of water and ice.

POEMS written in popular dialects can never be rendered successfully by translation into literary languages. They lose their flavour, their freshness, it may be, their quaintness, and one feels at once that they should never face the world in any but their native attire. Burns translated into classical French sounds absurd. Klaus Groth's Low German poems seem to evaporate under the hands of the translator, be he High German or English. In order to make them readable in England they should be translated into Scotch, or into any English dialect, although to do this successfully would probably require no less than a Burns. An experiment of this kind, and a successful one, has been made by a Swiss poet, August Corrodi, who, being a warm admirer of Burns, has translated some of his poems into exquisite Swiss German. Though the book was published four years ago, it has reached us but lately, the book-trade between London and Winterthur being evidently not of the briskest. We can recommend the little book to the admirers of Burns. Even without being intimately acquainted with Alemannic German, they will be amused to see, by comparing the original with the translation on opposite pages, how happily the homely Swiss dialect can be blended with the homely poetry of the Scotch ploughboy.

THE publication of the Report of the Commission upon the revenues of Oxford and Cambridge, coinciding as it did with the reassembling of their members, would appear to have already exercised a stimulating effect at the two Universities. Last week at the Cambridge Union Society a motion "That radical reform from without is undesirable for this University," was discussed for upwards of two hours, and ultimately carried by a narrow majority, the numbers being 98 to 73. At Oxford, if we are rightly informed, the Heads of Houses have already held a deliberative meeting, at the invitation of the Vice-Chancellor, and as a result of their deliberations have addressed a series of questions to the various colleges, of which the

following is the general purport:—Is your College disposed out of its endowments to subscribe money for augmenting the professoriate, and for general teaching purposes in the University? If so, what connexion would it desire to have established between itself and the professors whom it would support? Is your College disposed to subscribe towards other University purposes, such as for new schools, or for new buildings for the Bodleian Library? And finally, by what means could a common Board for the attainment of these objects be best formed?

ON October 29 was held, at the Institute of France, the annual meeting of the five Academies. The chair was taken by M. Bertrand, President of the Academy of Sciences, it being always given in rotation to the president of one of the five. M. Bertrand alluded to the illustrious members and foreign associates they had lost since last they assembled together: Elie de Beaumont, Guizot, Michelet, Beulé, Jules Janin, Gay, Quetelet, Dubois, Delarive, Agassiz, and Kaulbach. Papers were read "On the Disgrace and Fall of the Princesses des Ursins," by M. R. Saint-Hilaire; "On the Expressions of Light," by M. C. Blanc; "On Mirabeau and his Father," by M. de Loménie; and "A Poet at the Court of the Communi," by M. Miller. The report was also read of the commission appointed to adjudge the gold medal (value 60*l.*) for the Volney prize, to the best work on Comparative Philology. Five were sent in for competition. The commission did not consider any one of them worthy of the prize, but awarded gratuities by way of encouragement to two of the competitors, MM. Joret and J. Halévy.

HERR DÜNTZER's recent contribution to the already colossal mass of Goethe literature with which the German press has been inundated for nearly half a century, has not thrown any new light on the obscure relations of the poet to his friend Charlotte von Stein. Düntzer's work claims to give a life-portrait of Mme. von Stein, and it was understood that he had been allowed free access to a large mass of letters in the possession of the Goethe family.

PROFESSOR FRIEDRICH has consented to go from Munich to Bern in order to give a course of lectures on Church history during the coming winter semester in the High School, and to give his help in the creation of the Old Catholic faculty of Theology which has been decided upon by the Bernese government. After the close of the semester he will return to Munich, and Dr. Hirschwälder, who has lived for the last two years at Munich, will make Bern his residence, having accepted the call to the professorship of (Catholic) Moral and Pastoral Theology. The report spread abroad that Professor Friedrich had accepted the appointment, but it seems that he is determined not to leave Munich.

PROFESSOR HUXLEY's discussion of "The Hypothesis that Animals are Automata and its History" in the *Fortnightly Review* is, of course, somewhat fuller than the published reports of his lecture. It opens with a rather pointed suggestion that if the importance of Descartes' contributions to scientific psychology have been overlooked during the last century, the responsibility for the fact rests with those who might have profited more by his suggestions if they had not been so forgetful of the obligations under which they already lay. On the problem itself Professor Huxley appears to hold what would be considered the common-sense view, that most of the movements and affections of animals are conscious in the same way as, though perhaps in a less degree, than those of men, but that they have no independent consciousness of their mental states as such; at the same time he aims at defending Descartes for the paradoxical extreme to which his view was carried by insisting on the impossibility of attaining to anything more than a strong working probability on the other side. Mr. Grant

Duff's "Answer to Cassandra" is most full and argumentative in regard to the "religious rock," in the course of which he quotes a few lines written by Strauss on his deathbed which will be new to some readers:—

"Dem ich dieses sage
Weiss ich klage nicht,
Der ich dieses klage
Weiss ich zage nicht.
Nun heisst's bald verglimmen
Wie ein Licht verglimmt.
In die Luft verschimmen
Wie ein Ton verschimmt.
Möge schwach wie immer,
Aber hell und rein,
Dieser letzte Schimmer
Dieser Ton nur sein."

The first part of the editor's discussion of Mr. Mill's *Essays on Religion* is mainly taken up with an analysis of that on Nature, regretting that Mr. Mill had not dealt with the "Nature of science" as well as with the Nature of theologians, and fearing that some of the positions which he has granted "are not at all unlikely to be the springs of a new and mischievous reaction towards supernaturalism." All the remaining articles are interesting on their different subjects, though Mr. Stanton does not succeed in putting the objections to Mr. Thornton's theory of the "wages-fund" very conclusively. On the other hand, he puts in a new and suggestive light the excuse to be made for miners or other operatives who avowedly combine to restrict the supply of the commodities they produce, in order to arrest the fall of prices consequent upon a glut in the market—always the result of the speculative over-production of the capitalist class.

THE *Contemporary* opens with a very interesting article (to be continued) by Professor Tyndall, "On the Atmosphere in relation to Fog-Signalling," being an account of experiments made off the South Foreland in the summer of 1873, to test the power of sound as compared with lights for coast signals. The first result was to show that the opinion which has prevailed since Dr. Derham's paper in the *Philosophical Transactions* for 1708, as to the effect of fog in deadening sound, is unfounded, and that while certain states of the atmosphere are more favourable than others to the transmission of particular sounds, the range of all alike varies—to a surprising extent—but in a manner which repeated experiments show to have nothing to do with the optical clearness of the atmosphere at the time. On different days the same sounds were sometimes audible to a distance of 13½ miles, sometimes inaudible at a distance of three. Humboldt's observations at the Falls of the Orinoco suggested at last an explanation which future experiments appeared fully to confirm. The obstacle to the passage of the sound is the non-homogeneous state of the atmosphere produced by invisible clouds or streams of vapour rising irregularly from the surface of the water under evaporation, the sound being deadened or wasted by the reflections which it endures at the limiting surfaces of the rarer and denser air. The most interesting verification of the hypothesis was afforded by the fact that listeners in front of the aerial clouds which intercepted the sound received back from its surface echoes of unmistakable clearness and intensity. The author concludes that the rolling of thunder may probably be ascribed to these air-echoes, instead of to cloud-echoes, as has been done hitherto. We should have been glad of some explanation of the fact that "the day of greatest acoustic transparency" was also the day of longest echoes, because the hypothesis as first stated would seem to point to the opposite result.

Mr. Arnold explains that all verbs denoting existence are derived from roots which mean to breathe or to grow; that consequently "Cogito ergo sum" must be translated "I think, therefore I breathe," which is too inconclusive in itself to be the founda-

tion of a system of metaphysical theism. Lord Lytton points out that the *bourgeois* Monarchy of 1830 failed because the *bourgeoisie* did not uphold the ideas of their order, as is shown by the subversive tone of all their favourite writers but Scribe. Julian Hawthorne has studied the "Environments of Dresden" sufficiently to find materials for much ingenious vituperation.

In the November number of the *Penn Monthly*, a Philadelphia periodical, there is a clear, perhaps a trustworthy, account of the Indian Question in the United States, based upon a report of Mr. Walker, the late head of the Indian Bureau. Apparently, there are 64,000 Indians who are always on the brink of hostilities, and the best and cheapest plan is to bribe them to be quiet, and let them die out. Of the 236,000 who are more or less amenable to authority, those who are already established on the "Indian territory" cause no anxiety; some are doing well, and the rest are not much in the way, but there are comparatively large tribes, like the Sioux, whose present reserves do not enable them to live by the chase, and are in the way of colonisation, so that they cannot be confined to their reserves, nor the whites excluded from them, while it would be a dangerous experiment to remove them to the Indian territory: the writer's conclusion is that they, too, must be fed and left to perish.

In the *Cornhill*, J. D. gives an account of the Warton brothers, the worthy but grotesque precursors of Romanticism, with a quotation from the younger, which is certainly an anticipation of Scott. F. S. T., under the title "Feudal China," gives a series of interesting excerpts from the Ch'un Ts'ew, ascribed to Confucius, with the supplementary annotations of Tao, which contain the annals of China from B.C. 721–463. Here is a specimen:—

"Three gallant warriors drove up to the camp of Tsin; the archer shot an arrow into the camp, the spearman entered, slew his man, and cut off his ear as a trophy, carried another bodily away, while the charioteer coolly dusted his horses and arranged the harness. The soldiers of Tsin could not stand this insolence, and their chariots were quickly in pursuit in two divisions. Yoh Peh, the archer, kept them in check by shooting horses and drivers right and left, until he had but one arrow left. At that moment a stag bounded up from the forest, and crossed right before his chariot. Yoh Peh shot the animal with his last arrow, and the spearman, Sheh Shuh, descended from the chariot, took up the venison, and politely offered it to the foremost pursuer, with the remark, 'It is out of season, but I venture to present this to feast your followers.' Pao'u Kwei, of Tsin, was struck by the cool gallantry of the deed, and stopped the pursuit; so the chariot returned in safety."

The article on "Don Quixote" is shrewd, but fragmentary, and shows, we might even say displays, more knowledge than it imparts.

In the *Gentleman's Magazine* S. R. Townshend Mayer gives an interesting series of personal recollections and other memorials of Barry Cornwall, principally referring to his pathetic and forlorn old age. The author of "Authors at Work" has a very well-arranged though not perfectly accurate selection of anecdotes on the *£ s. d.* of literature, bringing out very clearly that the system of patronage disguised or undisguised, which was inaugurated by Montague and died with him, was much better for authors than dependence on the London public, probably even better than their present dependence on a cosmopolitan public.

In *Macmillan*, A. S. Stapleton takes advantage of the Comte de Jarnac's article on Peel in the *Revue des Deux Mondes* to restate the grounds upon which strict and intelligent Tories will always condemn his memory: they are summed up in three words of Macaulay's, "Caution without foresight." There is an interesting anecdote of a portrait of Wellington in Peel's collection. Originally Lawrence had intended to paint him watch in hand waiting for the Prussians; but Wellington insisted on the watch being changed

into a telescope: he was only looking for them. The Dean of Westminster contributes a "Sacramental Hymn," fervent, sonorous, and not too ingeniously unsectarian. The Viscountess Strangford edits a translation of Brugsch's version of the most suggestive fairy tale of the Two Brothers. The Rev. John Earle discourses on an unnamed habit of language—using two forms where one would do—points out that it would tend to clearness in English if this habit were indulged in a particular class of genitive, so that we could say a "description of Carlyle's" for a description of which Carlyle is the author—and gives copious illustrations of the confusion caused by the purism which rejects such forms. Captain Burton commences a series of geological notes on Rome.

In *Fraser* Richard Jefferies has a very instructive and tantalising article on the labourer's daily life: all the details are obviously trustworthy within the author's observation—about how farmers sink into labourers, and how labourers live in cottages which are for the most part encroachments on the highways—but we are not told to which part of the country these observations imply. In the same number we are informed that the article in the July number entitled A "Professor Extraordinary," erroneously ascribed by the *New York Semi-Weekly Tribune* to Bayard Taylor, is by a lady with a right to the initials B. T.

In *Blackwood* we have a description of the rarely traversed passes which lead over the Himalaya to Thibet, under the title of "The Valley of the Shadow of Death;" and a splendid metrical parody of Professor Tyndall's Address at the British Association, and a less damaging attack on modern scientific materialism in prose.

NOTES OF TRAVEL.

It is perhaps not generally known that the Russian and German governments have selected Tehran and Isfahan respectively as stations for observing the approaching Transit of Venus. The extraordinary purity of the atmosphere in Central Asia, in addition to political reasons in the case of Russia, has doubtless had much to do with the choice. But the main advantage possessed by the two cities we have named, is that English energy and capital, guided by the Government of India, have placed them in direct telegraphic communication with the observatories of Berlin and St. Petersburg. This, we need not add, will enable the astronomers to fix the longitudes of their observation stations with a correctness unattainable by any other means. So perfectly indeed can meridional distances be measured by the exchange of time-signals over the wire, that the *savants* employed by the American Government on the Coast Survey of the United States fixed the initial points of their topographical work by this means in preference to ordinary triangulation in a low-lying and densely wooded country.

It is difficult to understand why the scientific advisers of Her Majesty's Government should have omitted to take advantage of the Anglo-Indian Telegraph in selecting places of observation for the Transit, more especially as the scientific value of a chain of longitudes by telegraph between England and India has been more than once unsuccessfully urged on the Government of India by Colonel Walker, Superintendent of the Great Trigonometrical Survey. Fortunately, however, for the credit of English science, the officers of Engineers engaged on the construction of the Persian telegraph have not left to foreigners the task of proving the inaccuracy or the contrary of the longitude assumed as the basis of the Indian Survey. In 1870–71, Captains St. John and Pierson, with the co-operation of Captain Stiffe at Karachi, and Colonel Walker in London, completed a series of observations which showed a maximum error in the assumed longitude of the Madras observatory of twenty-four seconds of

arc, or less than half a mile. This satisfactory result formed the subject of a paper submitted by Colonel Walker to, if we remember rightly, the Royal Society.

But though individual exertion has in this case stopped a gap, we are about to see a blank in a proximate field filled up by a government whose interest in the matter can be nothing to that of our own. We learn from the current number of the *Geographical Review* and from other sources, that the Berlin Academy, aided by a handsome grant from the Prussian Treasury, is sending out a geographical and archaeological expedition to supplement the labours of their Transit party at Isfahan. Dr. Andreas, who will be in charge, expects to spend about three years in exploring Southern and South-western Persia.

It is no secret that the "Bureau Topographique" of Tiflis has been engaged for some years in the preparation of a large-scale map of the Shah's dominions; nor that Major St. John, of our own Royal Engineers, has been occupied for the last eighteen months in the compilation of a similar work for the India Office. Though much valuable information has been disinterred from the archives of both our own and the Russian Foreign Offices, we believe that the result in both countries has been to show that not a fourth of Persia has been surveyed at all, and at least half its extent is absolutely unexplored, the best known parts being those bordering on Russia, the least known those lying in the vicinity of the Persian Gulf, which sea has been to all intents and purposes a British lake for the last fifty years. Yet we know little more of the geography of the interior for 150 miles from the sea, except in the neighbourhood of the main line of communication, than we did in the days of Sir John Malcolm's embassies. It would be difficult to calculate how many millions we have spent, and spent well, in protecting English and Indian commercial interests by sea and on the coasts of Persia; but it can be safely asserted that we have not expended a single shilling in obtaining accurate information of the interior, which but for the journeys of a French botanist, "Aucher Eloy," would be little better known than the heart of Africa. Dr. Andreas has virgin ground to break, and we wish him every success.

M. LE COMTE MARESCALCHI has communicated to the Paris Geographical Society details of the recent deaths of Captains Fau and Moreau, who were attached to the French mission to Burma in the capacity of explorers, and who had intended to devote a year to visiting the lesser known parts of the country. It appears that the two officers while at Mone succumbed successively to jungle fever, which is very prevalent in these parts. The King of Burma had shown them great kindness and encouragement, and His Majesty was much grieved at the event. He has since ordered exceptional funeral honours to be paid, and a memorial to be erected: the corpses being destined for removal to France, through the agency of the French Consul at Rangún. Count Marescalchi announces that the Government of British Burma is preparing to send an expedition into Yunnan, and that a French missionary will be attached thereto. This probably means that the authorities are beginning to take active measures to survey the remaining portion of Captain Sprye's route into South-western China, permission for that step, so long urged by its supporters, having been recently accorded by Lord Salisbury. Our readers must not, however, forget that Baron von Richtshofen, the President of the Berlin Geographical Society, has emphatically pronounced against the feasibility of the Sprye project, and has adduced several weighty arguments in support of his views. Time alone can prove which of these two authorities is in the right.

THE *Globe* devotes space to a detailed consideration of the project for joining the Black Sea and the Sea of Azov by means of a railway at Ak-

manai to Theodosia, across the Isthmus of Perekop. This step, the same journal adds, is becoming really urgent on account of the great increase of export trade from the ports in the Sea of Azov.

A SERIES of letters signed "A. S. Kourbsky" has appeared in recent numbers of the *Messenger de l'Europe*, and from these communications, which profess to give information respecting the labour market of the United States, it appears that Russians play no insignificant part in the Far West. Those in the Indian territory, though amounting in number to only a few hundreds, are specially in request as *vacheros*, and bear a most excellent character for steadiness and for their kind treatment of the Indians, with whom they appear to sympathise. This is all the more astonishing when we consider their origin. M. Kourbsky informs us that the majority of these Russians are escaped convicts, who have fled from Eastern Siberia, and though unprovided with money and weapons, have managed to reach the Arctic coast or Behring's Straits, where they have been picked up by American whalers. Such a journey could only have been achieved by men of bodily strength and energetic temperament. On their arrival in their new home, they fortunately see the advantages of an honest life, and almost all seek employment as drivers of waggon caravans, in which capacity they have acquired quite a reputation. The Pacific Railroad has done much, however, to spoil their trade.

WE take from the *Journal de St. Pétersbourg* the following important intelligence. Fifteen years ago, Buys-Ballot in Holland, Fitzroy in England, and Le Verrier in France, introduced a system of storm-warnings, based on the then existing knowledge of meteorology, eked out with the help of the telegraph. The practical importance of this aid to navigation was duly appreciated by the sailors of those countries, and Mr. Scott, the director of the London Meteorological Office, has just given a further remarkable proof of its utility by a calculation that eighty per cent. of the storms foretold within the last few years have actually occurred. Russia and Germany, however, were slow to follow in the same course. The first director of the Central Physical Observatory, M. Kupffer, endeavoured to organise such a system, and he also obtained the consent of the Ministers of Education and of the Navy, but his early death prevented the fulfilment of the scheme. In 1871 a proposal was made to increase the Observatory budget by making provision for telegraphic weather announcements, but the item was disallowed. A general conviction was, however, gaining ground of the practical as well as scientific utility of storm warnings based upon established meteorological laws, and the International Congress at Vienna in 1873 gave the final impulse to the half-matured scheme. Towards the close of 1872 the Education Department (which has control over the telegraphs) and the Marine Department had arranged for the gratuitous transmission of telegraphic weather news and the publication of daily weather bulletins. This has enabled the Observatory authorities to undertake the duty of issuing storm warnings. The harbour-masters at Cronstadt and Revel have now arranged to erect storm signals, and a mast has been set up on the bank of the Neva at Vassiliostroff, where, in addition to the cylinder and cone apparatus, similar to our own, a bulletin is affixed on the approach of a storm. A like bulletin is also posted at the Bourse, and an explanation of the various signals (reproduced in *extenso* in the *Journal de St. Pétersbourg*) is to be found at each storm signal station, in ten different languages.

THE monument to the late Professor Agassiz is to take the appropriate form of a grand block of granite extracted from the lower glacier of the Aar in Switzerland, near the spot where the great geologist had recently pursued his scientific explorations in company with Desor and Vogt.

SELECTED BOOKS.

CORRESPONDENCE.

THE SHIEL-NA-GIG.

Ventnor: October 26.

In the Report of the Archaeological Association of Ireland in the *ACADEMY* of the 24th, the Shiel-na-gig exhibited by the Rev. J. Graves is there mentioned as a Priapic figure. This is a most inaccurate term, as the Shiel-na-gig is that of a female, while the Priapic figure is that of a male. They were for different purposes. The Priapic figure was for the purpose of warding off the evil eye; while the Shiel-na-gig was for driving away evil spirits. These Shiel-na-gigs are frequently found as protecting charms against evil spirits over the doors of old buildings and old churches in different parts of Ireland. One occurs at Binstead, near Ryde, over an old doorway of Norman date.

The Priapic figures were of Pagan origin, while the Shiel-na-gigs are evidently of a Christian period.

HODDER M. WESTROPP.

MR. HOVENDEN'S TRANSLATION OF THE ODES OF HORACE.

Hampstead: Nov. 2, 1874.

Mr. Hovenden cannot, I think, be serious in supposing that I could have suggested as an improvement in his translation of III. 30. 10, a word which has no meaning. "Ill-natur'd" is an obvious misprint; too obvious, I should have supposed, not to be at once perceptible to any careful reader; and certainly not destroying the general effect of the whole.

My objection was to the combination "rough, ill-water'd," which struck me as infelicitous, and at the same time capable of easy alteration.

R. ELLIS.

HOTTEN'S "ORIGINAL LISTS."

November 2, 1874.

As Messrs. Chatto and Windus, in their letter quoted by you last week, make a statement impeaching my veracity, I must ask your permission to reply.

In direct contradiction of what I had said in my former article, they declare that "Mr. Hotten's book contains over seventy pages more matter relating to New England than Mr. Drake's." I have only to say that this assertion is entirely untrue, and to defy those gentlemen to point out seventy, or even *seven* such pages. There are not quite four pages (283-6), which would make about one and a half of Mr. Drake's book, which Mr. Drake did not print, simply because the original was unknown at the time of his search. It has turned up since, and was printed in full in the *New England Historic-Genalogical Register* for 1871 (vol. xxv. pp. 13-15), and is therefore not new to Americans. I have again gone carefully over both volumes, page by page, and have no hesitation in affirming that there is not another New England List in Mr. Hotten's book that is not included in Mr. Drake's. So much on that head.

I am indebted to Mr. Sainsbury's letter in your last week's issue for the knowledge that Mr. A. T. Watson, of the Public Record Office, is responsible for the orthography of the volume. If the publishers had exercised a wise discretion they would have stated this fact, either on the title-page or in the preface, when I, and others who know that gentleman, would have unhesitatingly accepted his version. But they chose to give the sole credit to Mr. Hotten, whom very few respectable antiquaries, I suspect, would be willing to accept as an authority on any subject.

Mr. Sainsbury's comments upon the manner in which the volume is edited, the entire absence of references, &c., meet with my hearty concurrence, and would have been made by me, if I had not desired to let the publishers down as softly as possible. As they have not been satisfied with the rather extravagant praise which I bestowed upon the volume *per se*, but have chosen rather to cast an imputation upon my truthfulness, I will now say what I purposely avoided saying before, viz., that Mr. John Camden Hotten himself told me personally that he only designed the volume for a magnificent advertisement of his so-called "Heraldic College," to which he thus intended and expected to attract the entire American custom.

There can be no secret about the history of the book. It was evidently found, after reprinting Mr. Drake's volume, that, notwithstanding the ingenious device of displaying all the names in capital letters, it was not large enough to justify the high price demanded of American subscribers, and so it was eked out by what, so far as Americans are concerned, may be denominated as rubbish, which they will not thank the publishers for shooting upon their premises. If, however, the services of a capable editor—such a one, for instance, as Mr. Sainsbury—had been secured, almost an equal amount of similar lists, hitherto unpublished, might have been added to those printed by Mr. Drake, and notably among them, as Mr. Sainsbury has pointedly remarked, the very ones for which the editor, whoever he is, so piteously appeals in his preface.

JOSEPH LEMUEL CHESTER.

DR. WEYMOUTH ON EARLY ENGLISH PRONUNCIATION.

Maida Vale: Nov. 2, 1874.

As I am reviewing Dr. Weymouth, and not *vice versa*, I think I am entitled to the last word, if he will let me.

His protest is nothing but a louder and more intemperate reiteration of the statements (I cannot call them arguments) in his book. I do not propose to repeat my review *in extenso*, but wish merely to call attention to the more important misconceptions in his letter.

Dr. Weymouth complains that I have not quoted that part of the title of his book which says it is "In Opposition to the Views maintained by Mr. A. J. Ellis, &c." I have distinctly stated in the body of the review, that it is "a polemic against Mr. Ellis," which, I think, comes to much the same thing.

Nor do I see what this has to do with the question whether Dr. Weymouth approached the subject with an *à priori* theory or not. What I implied was that Dr. Weymouth formed a theory on English pronunciation *before* examining the evidence given in Mr. Ellis's book. If he can prove that he had made an independent examination of this evidence—including the tracts of Salesbury, which were unknown to Mr. Ellis himself when he began his investigations—I will withdraw my statement.

Dr. Weymouth's next grievance is that I differ from him in not considering Mr. Ellis's non-separation of the two *e*'s and *o*'s in Chaucer as "fatal for his whole theory." I have given my reasons as fully as is possible in a review. It must also be borne in mind that it is by no means proved that the two *e*'s and *o*'s were distinguished by Chaucer. In my review I took Dr. Weymouth's assertion about the separation of such words as *do* and *go* in Chaucer's rhymes entirely on trust, not having had time to examine the question myself, but I confess I should like to see the impartial statement of some cooler-headed investigator than Dr. Weymouth.

I think it will be agreed that, while avoiding the discussion of mere details, I have not shirked any of the main questions involved in Dr. Weymouth's theories. Yet he complains that I have expended my strength chiefly in remarks on the "tendency theory." Here Dr. Weymouth becomes quite unintelligible. He first abuses the "tendency theory," and then states distinctly that he believes in it himself! These are his words: "I too believe (as I have implicitly stated) in change in spoken language, and change no doubt according to certain laws as yet imperfectly understood." This is an exact definition of the theory in question, which Mr. Ellis and myself are accused of discussing "with glib facility."

But the main question is, according to Dr. Weymouth, one of rapidity of change. He thinks that language changes much more slowly than is commonly supposed, and seems to deny that changes can take place in a single generation. Here, again, he becomes unintelligible. It is clear that changes must begin somewhere, that is, in the mouth of some individual or number of individuals. To talk of a change extending over "thousands of years" would only be intelligible in the case of a nation of Methuselahs. Dr. Weymouth then denies that it is possible to recognise nascent pronunciations. Yet, when we find a certain pronunciation existing only sporadically in the mouths of the uneducated and of children, and only just making its way among educated adults, it seems reasonable to suppose that such a pronunciation is not so old as those which are spread through the whole body of the people. It is quite impossible to draw any general deductions as to rapidity of change in the face of the wide difference in various languages: the question is one of evidence for each language, not of *à priori* assumption.

As to the "unfortunate schoolboys," I confess that Dr. Weymouth's general arrogance and pretentiousness in philological discussion tempted me into a "chaffy" style, which I should otherwise have suppressed. The tone adopted by Dr. Weymouth, not only towards Mr. Ellis and, on a former occasion, Dr. Morris, but also towards the Philological Society generally, is certainly as little distinguished by "singular good taste" as any casual remarks I may have made.

HENRY SWEET.

25 Argyll Road, Kensington, W.: October 31, 1874.

It was my intention not to make any allusion to Dr. Weymouth's tract, which purports to be "in

opposition to the views maintained" by me in my own book, bearing the same short title, until I had time in proper course to examine the arguments of Dr. Weymouth. I have therefore abstained from even reading it. I knew the gist from having heard it read as a paper at the Philological Society, and from some replies which Dr. Weymouth kindly sent to my enquiries last year, and I had eighteen months ago commenced enquiries into the rhymes of *e* and *o* in Robert of Brunne, which, so far as they went, served only to show that if there were two sounds of each, the difference was not considered distinct enough to be attended to in rhyme. This, of course, does not prove that close and open sounds were not distinguished, because they are now broadly and regularly distinguished in Italian speech without influencing Italian rhyme. Grimm's German theory in respect to modern German practice is considered in pp. 1318-21 of the forthcoming part of my book. My own dialectal investigations, and Winkler's great Dialecticon of Low German dialects (of which I shall give an abstract), may possibly shed more light on this extremely delicate and difficult subject. It will be seen, I think, that the distinctions are local and variable, and not easy to maintain, being subject dialectally to curious disturbances from "vowel fractures," which are apt to change the open (Italian) *e*, *o*, into (Italian) *i*, *u*, and the close (Italian) *e*, *o*, into (Italian) *ei*, *ou*, which are again apt to become open (Italian) *e*, *o*.

I should not have troubled you with these remarks had not Dr. Weymouth, in his last letter to the ACADEMY, said that "Mr. Ellis, misled by the orthography, confounds the two classes of *e* words, and confounds the two classes of *o* words, 'fatally for his whole theory,' as I [Dr. Weymouth] contend." The utmost that can really be said is, that I made no theoretical distinction in Chaucer's pronunciation where I found no practical distinction in his rhymes. It is my intention to re-examine the whole of Chaucer's rhymes to see whether I have been mistaken, after the rhyming indices of the Chaucer Society have been prepared. I have so examined all the rhymes in Robert of Brunne's Chronicle, as edited (but not yet published) by Mr. Furnivall, from the rhyme lists which he lent me in manuscript compared with the lines cited; and, as already intimated, I find no distinctions there, that can be relied upon, between the sounds in these pairs. But I dwell principally on the words "fatally for Mr. Ellis's whole theory." I have no theory. I am purely an investigator. When from a number of carefully collected facts, which (thanks to the three Societies that have undertaken the publication of my book) I have been able to lay in precise citations and references before scholars, I have drawn certain conclusions, often very guardedly expressed, they merely represent the best and simplest hypothesis that I had been able to form as the expression of the *whole* of those facts. Should fresh facts come to light, they would have to be considered, and might very possibly lead me to modify that hypothesis. Considering that I have been so many years engaged on my work, and the extremely difficult and complex nature of my subject, I am rather astonished to find that there is so little which appears to be "shaky" in what I have done, and that my general conclusions meet with so much approval even when opposed to opinions previously held. Of course numerous little differences of opinion arise, but they are generally based on the facts I have myself collected, so that it would not detract from the value of my book if all those opinions (when not self-destructive) were adopted by my readers. My "theory," if I can be said to have one at all, has been that a writer upon antiquarian or philological subjects requiring extensive collections to enable anyone to form an opinion upon them, should make those collections as accurate and accessible as possible, and consider his own conclusions as accessory. I do not think that, even if

Dr. Weymouth's results were correct, they would be "fatal" either to this "theory" or the mode in which I have endeavoured to carry it into effect.

With regard to Dr. Weymouth's own *à priori* theory, I may quote the following from a footnote to page 255 of my own book: "While this sheet was passing through the press I received the following: 'As to O. E. and A. S. pronunciation, my scheme is *i* = *i* of *shine*, *é* = *ee* of *feet*, *a* = *a* of *father*, *â* = *o* of *bone*, *æ* = *a* of *fate*, *û* = *ou* of *house*, &c.,' a scheme utterly irreconcilable with the direct evidence of the last chapter." As this had reached me only as a private letter, addressed to a third party, I suppressed the writer's name. After Dr. Weymouth's book I think it no breach of confidence to say that the above scheme was in his handwriting. Now this was printed in 1868, and published in February, 1869, before Dr. Weymouth had read his paper to the Philological Society (June 17, 1870), and I believe before he had examined Chaucer's rhymes. This apparently justifies the assumption that Dr. Weymouth investigated to establish a foregone theory, not to discover an as yet unknown fact. As for my own conclusions, they were in general quite opposed to my previous opinions.

It is not my intention to discuss any of the very numerous opinions which have been expressed concerning the conclusions in my book so far as they go. Such a discussion would be quite premature. In the first place, my book, long as it is, is only about half published. The parts to be published this year and next will contain a vast amount of information on received and dialectal usages, either entirely new, or practically inaccessible, and I believe of great importance to the general investigation. And then, after a necessary rest of a couple of years, I hope, if life and strength remain, to go carefully over the whole work once more, to reconsider old conclusions under newly-acquired light, especially under the light of criticism, and the subsidiary investigations of Dr. Murray, Mr. Sweet, Professor Payne, the late Professor Hadley, and others, not forgetting Dr. Weymouth himself, and to make new researches if necessary to clear up points still doubtful, for publication in the concluding part of my work. This done, I shall be relieved from any further controversy, because I shall have done my best to put the matter "squarely" before students and scholars.

ALEXANDER J. ELLIS.

[We must decline to insert any further correspondence on this subject.—EDITOR.]

M. S. COMNOS AND TROY.

Athens: October 8, 1874.

Since my discoveries at Hissarlik have become known, I have been continually libelled by a set of men, each of whom pretends himself to have discovered the Homeric Ilium, at the head of a scientific commission sent out for the purpose by some government or other. They can never pardon me, a former merchant, a self-taught scholar, for having solved by gigantic excavations, at a cost of 250,000 francs, the great question, *Ubi Troia fuit*, and while the one calls me a crazy man fit for a lunatic asylum, the other does not scruple to impugn my character and to proclaim me publicly a forger, an impostor, a charlatan! Until now I saw these libels only in papers of a very inferior rank, and I therefore answered them merely by silent contempt. But now a libel of this sort, entitled "Ilium and Mykene," and signed by S. Comnos, of Athens, has found its way to the columns of the *Athenæum* of August 8, and my high esteem for this celebrated paper forces me to repel the author's vile calumnies.

Comnos insinuates that my Trojan antiquities are forgeries, for he compares them with the forged manuscripts of the notorious impostor Simonides. But for their genuineness we have no less an authority than that of Mr. C. T. Newton, the director of the British Museum, who, as he him-

self acknowledges, came here in December last for the express purpose of examining my collection, and I refer the reader to his article on the subject in the *ACADEMY* of February 14, and to the long and universally admired speech he delivered at the end of April, before the London Society of Antiquaries, the substance of which was published in the *ACADEMY*. In both the article and the speech Mr. Newton proclaims my Trojan collection, the pottery as well as the weapons and the treasure, to be *Prehellenic*, and to belong to that remote antiquity which we, vaguely groping in the twilight of an uncertain past, call *Prehistoric*. The libeller further accuses me of fraud by insinuating that I bought up the pottery in different places and represented it as being discovered by me at Hissarlik. No man who has the slightest knowledge of archaeology would have made this accusation, for all the thousands of Trojan vases have invariably been made by hand, without the potter's wheel; they have besides the red, black, green, or brown clay not painted, but wrought by hand-polishing to a lustrous surface, and are, in many instances, ornamented with incised patterns. Such vases have never been found yet either in Asia or in Greece, and none of the public or private collections in Athens contain a single one of them. Mr. Newton mentions one such vase in the Cypriote collection in the British Museum. But since this pottery is so exceedingly rare that the British Museum possesses only one specimen of it, how then, in the name of common sense, would it have been possible for me to buy up thousands of them in different places? Mr. Newton adds that the Trojan pottery has a strong family likeness in fabric and shapes to that pottery found under the lava at Albano, which is reputed to be the most ancient pottery of Italy, and of which the British Museum possesses several examples. He further states that the Trojan battle-axes, spear-heads, and other implements resemble those found in the most ancient tombs in Cyprus.

False is further my libeller's statement that I have found no inscriptions at Troy. Professor Th. Gomperz of Vienna has succeeded in deciphering many of my Trojan inscriptions, all of which prove to be in pure Greek, but in most ancient Cypriote characters. I refer the reader to Professor Max Müller's much admired article on the subject in the *ACADEMY* of June 6 last, in which he gives both the Trojan letters and the Cyprian varieties, which seem to correspond to them.

False is my libeller's statement that M. Eugène Piot, of Paris, a man to whose archaeological knowledge I give the highest credit, told him that the Trojan treasure dates from the sixth century after Christ, for that excellent gentleman, who was brought to me by Mr. Newton, proclaimed in his presence the treasure *Prehellenic* and *Pre-homeric*. Also Mr. Newton, in referring in his article of February 14 to the opinion of several other experienced archaeologists who saw the treasure, certainly includes M. Piot, in whose testimony he puts the greatest reliance. The truth that I found the treasure at a depth of 8½ mètres or 28¼ feet below the surface on the huge Trojan wall, and 5 feet below a prehistoric wall 20 feet high, has been amply confirmed by the two other treasures which have been discovered by me in the same depth, but which were stolen by my labourers and pounced upon by the Ottoman authorities, as announced in the *Levant Herald* of January 7, 1874.

As I have proved in my book, *Trojan Antiquities*, which Mr. John Murray is now publishing in an English dress, with engravings, the Ilium of the Greek colony was destroyed and abandoned under the reign of Constantius II. (335-361 A.C.), and the site has been lying waste ever since. The oldest archaic pottery is not found there beyond a depth of 2 mètres, or 6½ feet, and below this one finds solely prehistoric remains. At a depth of 4 mètres or 13¼ feet to 7 mètres or 23¼ feet are the skeleton-houses of a prehistoric city, which may be dug up like Pompeii; and just below this,

at a depth of from 7 to 10 mètres (23¼ to 33¼ feet) below the surface, are the skeleton-houses of an older and much richer city, which may be dug up perfectly in the same manner. Below this, at a depth of 10 to 16 mètres (33¼ to 53¼ feet) below the surface, are the ruins of a far more ancient city, of which, however, but a few walls are preserved.

If, as my libeller says, the treasure is of the sixth century after Christ, he who concealed it 28 or 30 feet below the surface, must have pierced the foundations of the Greek houses, and the walls or foundations of a number of prehistoric houses. But since the walls and foundations were undisturbed, no such concealment can have taken place. Against it speaks also the complete family likeness of the treasure with all the small golden ornaments which I found at a great depth in many different places. So, for instance, the gold ornaments I found with the skeleton of a woman at 13 mètres, or 43¼ feet, and a whole bundle of silver and electrum earrings and one golden earring I found at 9½ mètres, or 31¼ feet. In order to understand well what these depths mean, I remark that the height of a good house of two storeys is only 8 mètres, or 26½ feet.

False is further my libeller's statement that the Trojan gold rings are like the espousal rings used to this day in various parts of the East, for all the Trojan rings and earrings invariably consist of two, three, four, five, or six serpents, horizontally joined together, and this form is neither in use now, nor has it ever been found.

I think that I have proved in my book that Aristotle (*Hist. An.* ix. 40) is wrong in supposing that the Homeric *ἄμφω ἀμφότερον* was shaped like the cell of a bee, and that it is in Homer always synonymous with *ἄλειον ἀμφότερον* (see *Odyssey*, xxii. 9-10 and 86; also iii. 41, 46, 50, and 63), and simply means a goblet with two enormous handles.

I identify with the Homeric Ilium the city second in succession from the virgin soil, because only in that city were used the great tower, the great circuit-wall, the great double gate, and the ancient palace of the chief or king, whom I call Priam because he is called so by the tradition of which Homer is the echo; but as soon as it is proved that Homer and the tradition were wrong, and that Troy's last king was called "Smith," I shall at once call him so. This city having been destroyed by a fearful catastrophe, of which every stone, every potsherd, nay every gold bead shows unmistakable evidence, and the tower, the gate, and the walls having been buried six to ten feet deep by the red ashes and calcined stones, another prehistoric nation built a city right upon the latter, and, by the fact that they constructed the new chief's palace on the ruins which covered the old palace, and partly on the ashes which covered the double gate to a height of ten feet, it appears that they were unconscious of the monuments buried below their feet. Of the truth of my statement every visitor can convince himself at once with his own eyes, for I have broken away only so much of the new palace as was required to bring the whole double gate to light. If the premises and the objects discovered by me are carefully examined by a commission of archaeologists and geologists, it will no doubt be settled that the great catastrophe of the old city, in which alone the gate, the tower, the wall and the palace can have been used, must have taken place not later than 2000 B.C., while Homer cannot have lived earlier than 900 B.C., or 1,100 years after Ilium's tragic fate, which must have been sung by numerous rhapsodists before it was sung by him. If his poems alone have survived, it is because they were the most perfect and sublime. If Homer ever visited Ilium's sacred site, he cannot have seen any remains there, for the new city had ages ago been destroyed; another nation had built on its ruins their town, apparently of wood, which having disappeared in its turn, the place had been lying deserted for centuries, for only in

this way can it be explained why the objects found even in the highest prehistoric stratum, and just below the ruins of the Greek colony, show a remote antiquity, as compared with those described by the poet. He could only describe what he saw, and since the palaces at his time were built of wrought stone (*ξερτοία λίθοιο*), he of course gives this architecture to Priam's mansion.

Those who dispute with Hissarlik the honour of being the site of Troy must first be asked whether they believe that the Homeric Ilion really existed, or was merely an imaginary city of the poet, as the City of the Birds was an imaginary city of Aristophanes. If the latter is the case, then I have nothing to say; but in the former case I trust that my long article "M. Vivien de St. Martin et l'Ilion Homérique," which will have appeared this week in the *Journal Officiel*, and the *Temps* or the *Liberté*, and which will no doubt be reproduced by the English press, must and will for ever settle the great question *Ubi Troia fuit* in favour of Hissarlik.

The history of the site of Hissarlik, which his Excellency Safvet Pasha bought, precisely because I told him that I had bought it and solicited a "firman" to excavate it, is minutely told in the preface of my book, pages lii. to lv., and my correspondence with Mr. Vyne MacVeagh, then our United States Ambassador at Constantinople, proves that I have stated the truth. At his suggestion I signed the agreement to give up one-half of what I might discover, and a like agreement has been signed by hundreds of Englishmen, Frenchmen, Germans, and Americans who got "firmans" for archaeological researches in Turkey. None of them has ever thought of fulfilling this convention, while by the eleven cases of Trojan antiquities I have sent to the Imperial Museum I have become the sole benefactor it has ever had. I should have continued to send antiquities to the Museum, had it not been that my right to export my half of them was set aside by a Ministerial decree at the end of March, 1872. The Ottoman Government having thus arbitrarily infringed our agreement, I have thenceforward considered myself at full liberty to keep everything to myself; and if in so doing I have committed an injustice, I have the consolation of thinking that I have done this injustice in common with all the great English, French, German, and American archaeologists who ever made archaeological researches in Turkey; and that as long as this planet is inhabited by men, the whole scientific world will praise my memory for having committed this injustice, because the Trojan collection, and particularly the treasure, *cannot* be divided without being spoiled, and without being altogether ruined and rendered valueless. None of those who made excavations in Turkey has ever thought of offering an indemnity for having taken "the lion's share," whilst on my return from Troy my first care has been to offer an ample indemnity by proposing to the learned and indefatigable director of the Museum, M. Dethier, to continue the excavations for four months more at my expense, with 150 labourers, for the exclusive benefit of the Museum, whose delegates would have to superintend themselves the works, and to receive direct from my labourers whatever might be found.

My proposals have not been accepted, but I can do no more. Had I brought the Trojan antiquities to any other country, they would have been perfectly safe, for no tribunal in the world is competent to judge between two foreigners on the merits of a contract made in a foreign country. Besides, it has never happened yet that Turkey has claimed in England, France, Germany, or America anything from those who forgot the division of the antiquities they have found. Greece being small and powerless, there was danger in bringing my antiquities here. But my great love for Greece and the Greek people, of which my dear wife is a daughter, induced me

to bring them to Athens, for I had no doubt but the Greek Government would joyfully give to the discoverer of the Homeric Ilion the privilege to excavate in Greece wherever he pleased, provided he would put both the Trojan antiquities and all he might find here in a Museum to be built at his expense, and which would become national property at his death.

False is my libeller's assertion that, in consideration of a museum and my Trojan collection, I merely asked for the permission to excavate Mykene. The truth is that in June, 1873, I solicited from Parliament, in consideration of these advantages, the right to excavate both Mykene and Olympia. Parliament joyfully accepted my proposal, and voted thanks to me; but Government never made the convention with me, and later on made over Olympia to Germany.

False is, further, my libeller's statement that I have announced here in the *Greek newspapers* that, in order to save the treasure, I had been obliged to make the Turkish watchmen drunk. I ask the civilised world whether anything more odious can be imagined than to see a Greek invent such vile calumnies, solely for the purpose of injuring his own country's benefactor in his contest with the Ottoman Government?

False is, further, my libeller's assertion that I have been making clandestine excavations at Mykene, or that I have been stopped there by the local authorities from disinterring the treasure of Agamemnon. In January last I solicited the permission to excavate Mykene, but neither promised to build a museum nor to give up any part of my Trojan collection, and, in the presence of the government watchman, Costi, I merely sounded the ground in thirty-four places, in order to ascertain the extent of the work, the machinery required, and the time to be employed. Whatever small objects turned up in these soundings I at once sent to the museum of the Varvakeion here, together with a great many other antiquities I had purchased, among which was a wonderful hollow tile, $3\frac{1}{2}$ feet long and $1\frac{1}{16}$ broad, bearing two inscriptions of the fifth century B.C. Already in March I obtained the ministerial permission to excavate the Acropolis of Mykene, but the Ottoman Government having begun the lawsuit against me, I was detained here.

All the museums in the world wish to possess my Trojan collection, but I shall never use science as a tool to acquire wealth. I may make a gift of the collection, but I shall never think of selling it. I am not at all responsible for what the newspapers may have written or may write on the subject.

It is true, as my libeller states, that after the decisions of the Court of Appeal of May 23 and June 4, I promised to the Greek nation to bequeath them the Trojan collection; and the statement of the *Journal des Débats* of June 11-23 contains nothing to invalidate this, for there it is distinctly stated that in a moment of great danger, and weeks before the Court of Appeal had pronounced itself, I had offered to present the collection to the *Musée du Louvre*, provided it was received at once, and provided it would put an end to the Turkish lawsuit. It further states that no answer having been received, and the danger of the court ordering the sequestration becoming hourly greater, the collection had on a sudden mysteriously disappeared, and that consequently my offer was regarded as null and void.

Thus, I repeat once more, the *Journal des Débats* of June 23 proves that the present was offered to France in a moment of great danger, before the Court had decided; while, as my libeller himself acknowledges, the offer to Greece was made after the sentence of the Court, and thus at a time when the offer to France had long since become null and void.

Afterwards I solicited from Government the permission to demolish the great Venetian tower in the Acropolis, and this permission was granted to me at once with enthusiasm by H.E. M.

Valassopoulos, the Minister of Public Instruction. I therefore made an agreement with M. Martinelli to take it down for 13,000 drachms, or 465*l.*, and the work was just beginning when my enemies succeeded by their odious calumnies in inducing H.M. the most excellent King of Greece to revoke the permission, and to order the learned minister Valassopoulos to cancel not only the permission for the demolition of the tower, but also the permission to excavate Mykene, and never to allow me to do any work of public utility in Greece. The minister of course obeyed, but since H.M. the King seems to have no objection to the demolition of the tower, and only wishes that I should not do the work, and since, moreover, I do not wish that the Greek people should suffer from my libellers, I have at once paid the 13,000 drachms, or 465*l.*, to the learned directors of the Greek Archaeological Society, who thanked me for this gift in their letter of July 4-16, and promised to employ the money as soon as practicable for the demolition of the tower. But I am now going to give them permission to employ the money for the excavation of Mykene, in case, contrary to all expectation, H.M. might wish to preserve the tower. I have further begged them to excavate at my expense both the Treasury of Minyas at Orchomenos, and the Hermes Grotto at Pylos. But when I, as a foreigner, make here from mere love for science and for Greece such large sacrifices, I ask my libeller what sacrifices he has made from pure love for science, and whether he has rendered to archaeology any other service than his well-known clandestine expeditions for the smuggling of Greek antiquities from Athens to Constantinople? The assistance he contrives to render to Turkey in the Athenian tribunals by the foul and odious calumnies he heaps on my head, can of course have no other intent than to insinuate himself with Turkey, and to increase the profits of the abominable trade he carries on to the prejudice of his poor country, of which he is the greatest enemy.

The mode of treatment I experience here from Government forces me, of course, to leave Greece for ever, and disengages me at the same time from my promise to give to the country a museum and my collection.

I conclude by asking the civilised world to decide between me and my libeller Cimonos.

DR. HENRY SCHLIEMANN.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Nov. 7.	3 p.m.	Physical: Papers by Professors Foster and Guthrie, and Mr. G. F. Rodwell.
		" Bilow's Second Recital (St. James's Hall).
		" Crystal Palace: Mendelssohn's 95th Psalm, &c.
	8 p.m.	Royal Albert Hall Concerts: Opening Night.
		" First night of <i>Streethearts</i> at the Prince of Wales's Theatre.
MONDAY, Nov. 9.	8 p.m.	First Monday Popular Concert, St. James's Hall (Bilow, Sainton, Patti).
TUESDAY, Nov. 10.	8 p.m.	Civil Engineers: Mr. A. R. Binnie on "The Nagpur Water-works."
		Anthropological Institute.
	8.30 p.m.	Geographical: Lieut. Julius Payer on "The Discovery of New Arctic Lands by the Austro-Hungarian Expedition, 1872-4."
WEDNESDAY, Nov. 11.	1 p.m.	Sale at Christy's of a Collection of Old English Porcelain.
THURSDAY, Nov. 12.	7.30 p.m.	Historical: Mr. G. Harris on "Domestic Every-day Life, Manners, and Customs in the Ancient World. IV. Religious Rites, Ceremonies, and Superstitions."
	8 p.m.	Mathematical.
FRIDAY, Nov. 13.	8 p.m.	New Shakspeare Society: Professor J. K. Ingram on "The Weak Endings of Shakspeare, in relation to the Chronology of his Plays," Mr. T. Mallison and Professor Seeley, on "Hamlet's Inserted Speech of 'a dozen or sixteen lines.'"

SCIENCE.

The Correlation of Physical Forces. Sixth Edition, with other Contributions to Science. By the Hon. Sir W. R. Grove, M.A., F.R.S., One of the Judges of the Court of Common Pleas. (London: Longmans & Co., 1874.)

So long ago as the year 1843 the subject-matter of the essay on the Correlation of Physical Forces was discussed and developed in a course of lectures delivered at the London Institution. Since that time the essay has passed through six editions, and it now appears with considerable additions, necessitated by the progress of science during the last thirty years. Even if those portions of it which treat of experimental results and the mode of interpretation which should be applied to them were to become obsolete, the essay would always remain a standard guide to the student of science, on account of the closeness and clearness of the reasoning, the perfection of the logical treatment of the subjects discussed, and the judicial impartiality which is always displayed in deciding between rival theories or conflicting hypotheses. The object of the essay is to prove that the so-called Physical Forces, Light, Heat, Magnetism, Electricity, Chemical Affinity, and Motion, are very closely related, and that each one is capable either directly or indirectly of producing the remaining five. The author has further endeavoured to do away with all hypotheses of subtle entities, ethers, positive and negative fluids, and to show that the forces of Nature are in reality modes or affections of matter, presumably various kinds of motion. Since this essay first appeared, *heat* has been fully admitted to be a mode of motion. It was once believed to be a subtle kind of matter capable of penetrating the densest bodies, and by such penetration of effecting various changes; but since the exact determination of the relationship between heat and mechanical work, this idea has been abandoned throughout the scientific world; and we may surely predict that before long electricity and magnetism will likewise be proved to be modes of motion, instead of being regarded as latent kinds of matter:—

"The hypothesis of latent matter is, I venture with diffidence to think, a dangerous one—it is something like the old principle of phlogiston: it is not tangible, visible, audible; it is, in fact, a mere subtle mental conception, and ought, I submit, only to be received on the ground of absolute necessity, the more so as these subtleties are apt to be carried on to other natural phenomena, and so they add to the hypothetical scaffolding which is seldom requisite, and should be sparingly used, even in the early stages of discovery."

In reviewing the nature of the various affections of matter called forces, Sir W. Grove very justly remarks that it becomes a difficult matter to determine what constitutes a distinctive force; radiant heat and light are to a great extent differentiated by the manner in which they affect our senses; we should no doubt regard them very differently if they were viewed in accordance with the manner in which they affect matter external to ourselves. A trivial event in the history of a force has sometimes conferred a name upon it: thus *electricity* takes its

name from the substance in which it was first observed, *magnetism* from the district in which the magnet was first found. Some forces have several names, such as voltaic electricity, galvanism, dynamic electricity, current electricity, kinetic electricity. *Chemical affinity* is certainly an inappropriate and ill-chosen word, and *chemical attraction* is not much better.

It is by no means difficult to show that any one of the physical forces can produce any other—that motion becomes electricity, for instance, in an ordinary plate machine; or that heat is converted into motion in a steam-engine; but more than this, it appears that in many instances, where one force is produced, the others are also evoked:—

"Thus, when a substance such as sulphuret of antimony is electrified, at the instant of electrification it becomes *magnetic* in directions at right angles to the lines of electric force; at the same time it becomes *heated* to an extent greater or less according to the intensity of the electric force. If this intensity be exalted to a certain point, the sulphuret becomes luminous, or *light* is produced; it expands, consequently *motion* is produced; and it is decomposed, therefore *chemical action* is produced."

The essay is followed by a discourse "On Continuity," delivered in 1866 in Nottingham, when Sir W. Grove was President of the British Association for the Advancement of Science. It is quite a model of what a president's address should be. Clear, comprehensive, logical, and suggestive, it gives an account of the more recent developments in the physical sciences, and it is interlarded with pregnant remarks, such as the following:—

"It is much more easy to invent a *Deus ex machina* than to trace out the influence of slow continuous change: the love of the marvellous is so much more attractive than the patient investigation of truth, that we find it to have prevailed almost universally in the early stages of sciences."

And again:—

"My own impression is that the philosophy of the future, not merely as applied to physical forces and the science of organisms, but to the history of the human race, its habits, laws, languages, and possibly thoughts themselves, will be mainly based on the doctrine of continuity, and that instead of enquiries as to *why* a thing is in the sense of ascertaining its ultimate causation, the research will be into the question *how* did it become what it is? By what steps of change, by what mode of force did the substance, the phenomenon, the organism, the habit, or the event arise?"

The remainder of the work—about one-half—contains Sir W. Grove's practical contributions to science, his experimental work, and investigations. First, and of the first importance, comes the nitric acid battery devised in 1839, and commonly known as "Grove's battery," the most powerful form of voltaic battery known. Such a battery, possessing about four square feet of platinum foil, will liberate about 110 cubic inches of the mixed gases from water in *one minute*, and will heat a strip of platinum a foot long by an inch broad to whiteness. The gas battery was devised in 1843, and described before the Royal Society; it is not often seen nowadays, but the principle is most ingenious. Another important paper is on the "Decomposition of Water by Heat," communicated to the Royal Society in 1846.

Sir W. Grove found that platinum heated to whiteness will decompose water into its constituent elements, an effect previously believed to be impossible through the agency of heat alone. These researches from beginning to end teem with suggestions which we commend to all students of science. The papers on "Electrolysis across Glass," and "On some Effects of Heat on Fluids," may specially be indicated as containing the germs of a dozen researches. The work from beginning to end cannot be too highly commended both for its matter and style. Sir W. Grove is a well-read man in regard to other things than experimental philosophy, and he often gives us the benefit of this reading, and always gives evidence of an accurate habit of thought.

G. F. RODWELL.

WOLF-CHILDREN.

WOLF-CHILDREN are like sea-serpents. Though scotched and killed, they turn up again and again, each time in fuller vigour and supported by more powerful witnesses. I take no interest in sea-serpents, but the question whether children have ever been suckled, reared, and educated by wolves is one of considerable importance in the treatment of ancient myths. There are, of course, many elements in mythology which are purely miraculous, such as the birth of Achilles, as well as of Helen, and no comparative mythologist would trouble students of natural history with questions on the physical possibility of such events. But there are other ancient stories which, though incredible to us, are in themselves not impossible. Here it is absolutely necessary that the question of their physical possibility should be settled first, before we can place them in the category of the miraculous, and apply to them the proper tests for discovering mythical ingredients. Whether children, carried off by wolves, could be suckled and kept alive in a den for any length of time, is surely a question which students of natural history and even practical sportsmen might settle for us once for all, while the documentary evidence in favour of the existence of such wolf-children might exercise the ingenuity of some of our cleverest lawyers. When they have done their work, and not till then, the work of the comparative mythologist will begin. I therefore proceed to put together some of the best authenticated cases of wolf-children, without, however, presuming myself to pronounce any opinion, either adverse or favourable.

The *Journal of the Asiatic Society of Bengal*, one of the most useful publications of the kind (it was founded in 1832, as a continuation of the *Asiatic Researches*, 1788-1832), has lately taken up this subject again. In the *Proceedings* for June, 1873, there is a curious article, "Notes on Children found living with Wolves in the North-Western Provinces and Oudh, by V. Ball, Esq., B.A., Geological Survey of India." The author, after some prefatory remarks, gives the following extract from a letter received from the Rev. Mr. Erhardt, Superintendent of the Orphanage at Secundra, in reply to his request for information regarding a boy in that Institution, who was alleged to have been found living with wolves.

"We have had two such boys here, but I fancy you refer to the one who was brought to us on March 5, 1872. He was found by Hindus, who had gone hunting wolves in the neighbourhood of Mynpuri. Had been burnt out of the den, and was brought here with the scars and wounds still on him. In his habits he was a perfect wild animal in every point of view. He drank like a dog, and liked a bone and raw meat better than anything else. He would never remain with the other boys, but hide away in any dark corner. Clothes he never would wear, but tore them up into fine shreds. He was only a few months among us, as he got fever and gave up eating. We kept him for a time by artificial means, but eventually he died.

"The other boy found among wolves is about thirteen or fourteen years old, and has been here almost six. *He has learnt to make sounds, speak he cannot; but he freely expresses his anger and joy; work he will at times, a little, but he likes eating better.* His civilisation has progressed so far that he likes raw meat less, though he still will pick up bones and sharpen his teeth on them.

"Neither of the above are new cases, however. At the Lucknow madhouse there was an elderly fellow only four years ago, and may be alive now, who had been dug out of a wolves' den by a European doctor—when, I forget, but it must be a good number of years ago.

"The facility with which they get along on four feet [hands and feet] is surprising. Before they eat or taste food they smell it, and when they don't like the smell, they throw it away."

"Mr. Ball then quotes the well-known story [vide *Ann. and Mag. Nat. Hist.*, 1851, p. 163] of the capture of one these wolf-reared children on the banks of the Gumpiti, who was afterwards taken to Lucknow, and who is in all probability the 'elderly fellow in the Lucknow madhouse,' referred to in Mr. Erhardt's letter.

"The writer then draws attention to a remarkable feature in all the stories, viz.: that the wolves are invariably alleged to have communicated much of their natural ferocity, and notably untameable disposition to their foster-children, and attempts to account for their somewhat unwholf-like treatment of them.

"The author, in conclusion, states that his object in putting forward this account is to bring about a thorough investigation of a subject which, if these stories of wolf-reared children could be substantiated, must prove of considerable physiological interest and importance.

"Mr. Blanford said he could not think the evidence adduced by any means satisfactory, and he would be glad could any one, endowed with some amount of judicial scepticism, visit the Secundra Orphanage and ascertain, as far as possible, on what kind of testimony these accounts of wolf-children really rested. He did not, of course, question that the Superintendent of the Secundra Orphanage wrote in good faith that which he really believed.

"After some further discussion it was agreed, on the motion of the President, that the Secretary should write to the Superintendents of the Secundra Orphanage and the Lucknow Lunatic Asylum, so as to obtain, if possible, further information on the subject."

In the Proceedings for August, 1873, the following letter was read from the Rev. Mr. Erhardt, in reply to a letter of the secretary, asking for further information as to the fact of the finding of certain children in the company of wolves. Mr. Erhardt gave no new facts, but stated his very strong belief of one of the children referred to having been burnt out of a wolves' den, such belief being founded on the extremely animal-like and filthy propensities of the child when brought to the asylum, the recent burns on his person, and the testimony of the persons who brought him.

This evidence might probably be set aside, if it stood by itself. But it must be recollected that stories of the same kind, and supported by much more business-like witnesses, have appeared in Indian papers during the last fifty years. The most important witness is the late Colonel Sleeman, a man of unimpeachable character, one of those truly great men whose names are less known than their works. He was Commissioner for putting down Thuggee, and probably knew more of the real life and character of the people of India than any Indian officer. His *Rambles* are still one of the most useful and delightful books, and have been quoted on this very subject of Wolf-children by Grote in his *History of Greece*. He was afterwards Commissioner for Oude, and it is from his book, *Journey through the Kingdom of Oude*, 1858 (vol. i, p. 208), that the following statements are taken. According to Colonel Sleeman, the number of the little victims carried off by wolves to be devoured is so great in some parts of India, that people make a living by collecting from the dens of wild animals the gold ornaments with which children in India are always decked out by their parents. It is said even that the

people are unwilling to take part in any wholesale destruction of wolves, for fear of losing their livelihood.

From a number of cases, more or less fully attested, of wolves taking compassion on a child, and bringing it up together with their own cubs, I select the following:—

"A trooper, sent by the native governor of Chandour to demand payment of some revenue, was passing along the bank of the river about noon, when he saw a large female wolf leave her den, followed by three whelps and a little boy. The boy went on all fours, and when the trooper tried to catch him, he ran as fast as the whelps, and kept up with the old one. They all entered the den, but were dug out by the people with pickaxes, and the boy was secured. He struggled hard to rush into every hole or den they came near. He became alarmed when he saw a grown up person, but tried to fly at children and bite them. He rejected cooked meat with disgust, but delighted in raw flesh and bones, putting them on the ground under his paws, like a dog. *They tried to make him speak, but could get nothing from him but an angry growl or snarl.*"

So far, the evidence rests on native witnesses, and might be considered as more or less doubtful. But the boy, after having spent a short time with the Rajah of Harunpoor was afterwards forwarded to Captain Nicholets, the European officer commanding the First Regiment of Oude Local Infantry at Sultanpoor. Captain Nicholets made him over to the charge of his servants, and their accounts completely confirm what was stated before. The wolf-child would devour anything, but preferred raw meat. He once ate half a lamb without any effort. He never kept on any kind of clothing, and a quilt stuffed with cotton, given to him in the cold weather, was torn by him and partly swallowed.

In a letter, dated the 17th and 19th of September, 1850, Captain Nicholets informed Colonel Sleeman that the boy had died in the latter end of August. He had never been known to laugh or smile. He formed no attachment, and seemed to understand little of what was said to him. He was about nine years old when found, and lived about three years afterwards. He would run on all fours, but occasionally he walked uprightly. *He never spoke; but when he was hungry, he pointed to his mouth.* Only within a few minutes before his death, the servants relate that he put his hands to his head, and said "it ached," and asked for water: he drank it, and died.

Another instance is related by Colonel Sleeman as having happened at Chupra. In March, 1843, a man and his wife went out to cut their crop of wheat. The woman was leading her boy, who had lately recovered from a severe scald on the left knee. While his parents were engaged, the child was carried off by a wolf. In 1849 a wolf with three cubs was seen about ten miles from Chupra, followed by a boy. The boy after a fierce resistance was caught, and was recognised by the poor cultivator's widow by the mark of a scald on the left knee, and three marks of the teeth of an animal on each side of his back. He would eat nothing but raw flesh, and could never be brought to speak. *He used to mutter something, but never articulated any word distinctly.* The front of his knees and elbows had become hardened from going on all fours with the wolves. In November 1850 Captain Nicholets ordered this boy to be sent to Colonel Sleeman, but he got alarmed and ran to a jungle. The evidence therefore of this case rests, to a certain extent, on native authority, and should be accepted with that reservation.

The same applies to a third case, vouched for by the Rajah of Hasunpoor, which adds, however, nothing essential, except that the boy, as seen by him in 1843, had actually short hair all over his body, which disappeared when he took to eating salt. He could walk on his legs, but *he could not speak. He could be made to understand signs very well, but would utter sounds like wild animals.*

Another, a fourth case, however, is vouched for again by European witnesses. Colonel Gray, who

commanded the First Oude Local Infantry at Sultanpoor, and Mrs. Gray, and all the officers of the place, saw a boy who in 1843 had been caught while trotting along upon all fours by the side of a wolf. *He could never be made to speak, and at last ran away into the jungle.*

A fifth case rests on the evidence of a respectable landholder of Bankeepoor, in the estate of Hasunpoor (called Zoolfukar Khan). Here too the boy, who had been six years old when carried off, who was ten when rescued, *could not be brought to speak, though it was easy to communicate with him by signs.*

One other statement of a wolf-boy is given by Colonel Sleeman, but as it rests on native evidence only, I will only add that this boy also, when caught, walked on all fours, ate raw meat, and smelt like a wolf. He was treated kindly, but though he learnt to behave better and walk uprightly, *he never could understand or utter a word, though he seemed to understand signs.* One witness states that he uttered the name of a little girl that had been kind to him (Aboodeea), and that he showed some kind of attachment to her; but this sentimental trait is not confirmed by other witnesses.

There are other cases, but those which I have selected are to my mind the best attested. They all share one feature in common, which is of importance to the student of language more even than to the student of mythology, viz., the speechlessness of these wolf-children. It was this fact, more than the bearing of these stories on a problem of mythology, which first made me collect the evidence here produced. For as we are no longer sufficiently wolfish to try the experiment which is said to have been tried by a King of Egypt, by Frederic II., James IV., and one of the Mogul Emperors of India (*Lectures on the Science of Language*, 7th ed. vol. i. p. 394), viz., to keep babies in solitary confinement in order to find out what language, if any, they would speak, these cases of children reared by wolves afford the only experimental test for determining whether language is an hereditary instinct or not. Two things have to be decided, and I suppose can be decided by competent judges:—

1. Are these stories physically possible? Will wolves, when they have ceased to suckle, and after they have driven away their own cubs, allow a human cub to remain with them?

2. Are the stories attested by witnesses who were capable of sifting evidence? The further question, whether English gentlemen and officers would wilfully have perverted the truth, need surely not be asked—certainly not in the case of Colonel Sleeman.

The fact that in the mythologies and traditions of people widely separated from each other, and apparently unconnected by language or religion, we meet with stories of children suckled by wolves, should be kept entirely out of sight for the present, for it would only serve to confuse the question before us. Let it first be settled whether the cases adduced are sufficiently attested; secondly, whether they are physically possible, and we shall then be better prepared to say whether there are real and historical elements in the story of Romulus and Remus, and other gods and heroes of antiquity, or whether such stories must be looked upon as simply miraculous, and treated in the same manner as all other mythological deposits, whether of ancient or modern growth.

MAX MÜLLER.

The Universities Commission Report.—Vol. I. (Second Notice.)

THE abstracts of the returns of the individual Colleges printed in this volume have been compiled by or under the direction of the Commissioners themselves, being of course based upon the answers which the college officers have given to the minute and searching series of questions which the Commissioners addressed to them.

These abstracts are sufficiently full and explicit to satisfy all general enquirers, especially as they are occasionally illustrated by the instructive comments of the Commissioners; but perhaps critical economists among the undergraduates would be better pleased to discover the particular items of expenditure out of the internal income to which they themselves so largely contribute. It is this part of the report that must be referred to for explanation in detail of the large totals contained in the synoptical tables, and also for much curious information upon the different dispositions of their revenues adopted by the several colleges.

Independently of their corporate incomes, the surplus of which is usually treated as divisible among the fellows, the majority of the colleges both at Oxford and Cambridge hold considerable amounts of trust funds, the totals of which in the former University reach 35,000*l.* a year, and in the latter 25,000*l.* The expenditure, of course, of these funds is in most cases limited to specific purposes, which represent those objects which benefactors, later in date than the original founders, have thought most deserving of endowment. It is, therefore, noticeable that at both Universities scholarships and the augmentation of benefices form considerably the two largest items in this expenditure. In almost all cases these trusts are primarily for the benefit of the colleges, who are themselves the trustees: the Sheepshanks fund at Trinity College, Cambridge, which is devoted to an astronomical observatory, being almost the solitary example of a trust vested in a college and used in furtherance of general University interests. This circumstance, however, that the colleges are, in legal parlance, both trustees and *cestui que* trusts, renders it the more necessary that the expenditure under this head should be jealously scrutinised. The Commissioners have not failed to observe that a considerable laxity prevails in the management of these trust funds, which would not pass uncensured in a Court of Equity. They state in their general report that

"we find some cases where the expenditure is included in the general expenditure of the college; and there are instances in which balances of trust accounts receiving no interest appear to be unnecessarily large. It is only in some few cases that a correctly drawn balance-sheet, including all the accounts both corporate and trust, and showing their respective balances, has been sent to us, or, indeed, appears to be made."

Corpus Christi College, Cambridge, presents a signal example of this lax management, for with an income of 800*l.* from trust funds, the corresponding expenditure has been altogether withheld from the Commissioners, who further observe that in several other particulars their enquiries have been imperfectly answered by this college. It is noticed, too, that at University College there was in the year 1871 a balance amounting to 9,000*l.* due to the Linton trust, on which no profit accrued. The Sheppard benefaction at Magdalen, Oxford, also merits attention. It has a net income of more than 2,000*l.*, to be appropriated "to such uses as are likely to promote piety and learning in that or any other college." Out of this total the expenditure was—on management, &c., 300*l.*; on subscriptions, &c., 470*l.*; on benefices, &c., 720*l.*; leaving 540*l.* for Magdalen and other schools. The Hulme trust connected with Brasenose exhibits a similar deviation from the intention of the benefactor as described in his will, for in this case no less than 5,000*l.* out of a total income of 7,000*l.* is devoted to various ecclesiastical purposes which are not hinted at in the original will; but the responsibility for this must be thrown upon subsequent acts of Parliament. Concerning the internal management of the Cambridge colleges the Commissioners pass an adverse criticism, which in its scope is not unconnected with the subject just noticed. Their opinion is very unfavourable to the system which appears to be universally prevalent at that university, by which the undergraduates make their payments of every kind direct to their college tutors, and

not to the bursars; and the tutors retain on their own account the caution money, to reimburse themselves out of the interest thereon for possible losses on battels, and divide of course the tuition fees among themselves. The result of the system is that the accounts under these two headings have come to be regarded as a private arrangement between a tutor and his pupil, and in some cases information on this subject has been unwillingly given. In Oxford, on the other hand, all the internal payments and expenses are managed through the financial officer, and the total amount of the caution money, which is often very great, is not unfrequently regarded as available for current expenditure. That this system does not afford any guarantee for ordinary economy may be proved from the example of St. John's, where the arrears of battels not only swallow up the entire capital of the caution money fund, but 5,500*l.* besides. In the matter of external management the Cambridge colleges have the advantage over those at Oxford, for their annual incomes are much more regular and unencumbered, owing to the circumstance that of their estates more than two-thirds are let at rack-rent, and apparently have been so let for some time past, whereas at Oxford more than one half is still let on beneficial leases for years and for lives, and of the remainder a large portion has only lately been got into hand. The evils of the old practice cannot be better illustrated than by the case of the house property owned by Queen's College, Oxford, at Southampton. The estimated annual value of the whole for letting at rack-rent is put at 12,000*l.*, and the actual rent reserved is 230*l.* To this must be added the value of the fines, which under the present system recur at intervals of fourteen years; and one of these windfalls, which came due in the year 1870, amounted to no less than 8,500*l.*, and being divided among the beneficiaries of that year, raised the income of a fellow on the old foundation to more than double its average rate. From the returns of Christ Church may be learnt how large is the capital sum required to extinguish this old system of letting corporate property; for they show that between the years 1864 and 1872 sums amounting to 85,600*l.* were borrowed to meet the loss of fines occasioned by the non-renewal of beneficial leases. This college (and it is perhaps not beneath notice that the Commissioners regularly apply this term to Christ Church) was enabled, out of current income, to defray all the outlay in the shape of repairs, &c., rendered necessary by this change in the mode of letting; but that this outlay must have been very great is proved by the case of New College, where within the last ten years 20,000*l.* has been expended on analogous items. The returns of Christ Church also teach the lesson that all kinds of house property are not equally remunerative; for this college owns a considerable quantity of land within the city of Oxford, and has adopted the policy of taking this property into its own immediate management, and in keeping it in a good state of repair. It appears to have thus laid out upon model lodging-houses and other cottages about 6,500*l.*, exclusive of the value of the sites; while the gross accruing rent is only 253*l.*, for which the outgoings for repairs, rates, and taxes have to be deducted, which would leave a bare profit of some 3 per cent.

The College returns yield moreover some suggestive figures showing the proportion of the endowments which are devoted to purposes that are strictly educational. Out of the total corporate revenues at Oxford 25,000*l.* is allotted to scholarships and exhibitions, whereas the fellows divide among themselves four times that amount; while at Cambridge the proportion that falls to the scholars is yet smaller. Throughout the two universities, Balliol and Jesus College, Oxford, appear to be the only two places where this proportion is reversed, for with them the undergraduate members receive a greater share from endowments

than the graduates. The tutorial fund is augmented from the corporate income by grants which collectively amount at Oxford to more than 4,000*l.*, and at Cambridge to 2,600*l.* The tuition fees paid by undergraduates reach at Oxford the remarkable figure of 29,000*l.*, and at Cambridge perhaps as much, but four colleges at the latter university have withheld information on this subject. The returns of the individual colleges strengthen the conclusion suggested by these totals, that as educational establishments, with fair charges for board and lodging, the colleges are capable of being self-supporting. For example, Keble College, with absolutely no endowment, makes an annual profit of 500*l.*, whereas Corpus, Oxford, which has an external income of 15,000*l.*, is induced out of its superfluity to spend 1,000*l.* a year in meeting the losses incurred on the kitchen and battery accounts. Balliol also is enabled to maintain its staff of teachers without drawing at all upon any fund except that which it receives from its undergraduates definitely for that purpose. But the returns of Exeter College at Oxford are the most instructive on these matters. Its income from its various properties amounts to less than 6,000*l.*, whereas the stipends of the rector, fellows, and scholars come to more than 7,000*l.* This apparent deficit is abundantly redressed by the sum of 11,500*l.*, which is paid under different items by the undergraduate members of the college in the course of a single year. Pembroke, Oxford, presents a similar illustration of the profits which may be gained by a college by means of an economical system of management. On the other hand, King's College, Cambridge, has an income from endowment of 34,000*l.*, of which sum the head and fellows receive nearly one-half; for including the scholars, the number of undergraduates at this college in the year 1871 did not exceed thirty, whereas the fellows were forty-nine in number. All Souls, at Oxford, presents a somewhat analogous state of affairs, but with this important difference, that there is no restriction upon its fellowships confining them to members of the college.

The Commissioners have not thought fit to say a word about the proportion of the fellowships which are confined to those who are already in orders, or who promise to take orders, nor to give any information concerning the number of those who are engaged in college work, or of those who are non-resident; and perhaps, if any of these figures were given, they would only excite delusive conjectures as to "the uses to which the college revenues are applied." The Appendix to the Report contains, among other things, the revised statutes and ordinances of several of the Oxford colleges which have received the sanction of the Queen in Council, and also an elaborate scheme of college reform proportioned to the future increase of its endowments, which appears to have been adopted, in principle at least, by the governing body of New College. That fellowships should be divided between those connected with tutorial and professorial functions, and those awarded as prizes, limited in value and in duration, and that celibate restrictions should be removed, seem to be the general tendencies of all these new schemes—tendencies which were manifest in the celebrated Cambridge memorial to Mr. Gladstone, here also reprinted. There are besides to be found in the Appendix various letters and memorials referring to the project, now carried out by Cambridge, of sending missionary lecturers into the great manufacturing towns of England. J. S. COTTON.

NOTES AND NEWS.

IMMEDIATELY outside the sacred fane of Atashkija, where the eternal fires of Baku are religiously guarded, extensive chemical works have within the last few years been established for the preparation of petroleum. Here the combustible gases as they issue from the soil are collected and ultimately utilised as a source of heat

in distilling the naphtha which is so abundantly distributed throughout the peninsula of Abscheron. A visit to this remarkable locality has enabled Herr Trautschold, of Moscow, to lay before the German Geological Society an interesting paper, "Ueber die Naphthaquellen von Baku," which appears in the current number of the Society's *Zeitschrift*. Accompanying the memoir is a map of the peninsula on which Baku is situated, showing the distribution of the numerous mud-volcanoes, the springs of naphtha, and the sources of the inflammable gases. Four distinct kinds of springs may be distinguished, according as they yield fresh water, salt water, naphtha, or gaseous products. The gases are most abundant in the neighbourhood of Surachany, while the naphtha is found chiefly in the district of Balachany. It would appear, however, that the soil throughout the entire district is more or less charged with naphtha; thus it exudes from the ground in company with the gaseous hydrocarbons, and it floats upon the surface of the salt water in the mud-volcanoes. The naphtha profusely thrown out from these sources becomes inspissated by exposure to the atmosphere, and ultimately hardens to a solid bituminous mass. This consolidated naphtha, known under its Tatar name of *kir*, is not only used as a fuel, but is employed in the town of Baku for roofing and other purposes. The naphtha is chiefly derived from beds of sand and sandstone of Upper Tertiary age, but the ultimate origin of this and of the gaseous hydrocarbons is a standing enigma to the chemical geologist. Trautschold could find in the naphtha-bearing beds no trace of vegetable structures which might have yielded the organic materials, and from some excavations in sand charged with naphtha he obtained only shells of *Cardium trigonoides*, Pall., and *Mytilus polymorphus*, Pall. Is it possible that the animal matter of these molluscs, under peculiar conditions of decomposition, could have yielded the hydrocarbonaceous products in question?

A DESCRIPTION of a rich deposit of mammalian remains in Windy Knoll Quarry, near Castleton, in Derbyshire, has recently been read before the Literary and Philosophical Society of Manchester by Mr. Rooke Pennington. The remains were found in a reddish loam, filling a basin, or expanded fissure, in the Mountain Limestone. Bones and teeth of the bison and the reindeer were most abundant, but associated with these were the remains of the wolf and the grizzly bear (*Ursus priscus*). It seems likely that in Pleistocene times this spot was a swampy drinking-place, and that vast herds of bison and reindeer passing up from the valley of the Derwent into the plains of Cheshire, halted here to drink; some would fall in while drinking and others would be bogged, whilst the carcasses of those that might die in the neighbourhood would be washed in during rainy weather. As to the bears and wolves, they probably followed the herd to eat up the weak, the sick, and the straggling. The mammalian remains were determined by Mr. Boyd Dawkins, who calls attention to the fact that the young of the bison were out of all proportion to the adult, from which he infers that the place was haunted by these animals in the summer and early autumn. This ossiferous deposit is the same as that previously described by Mr. Plant (see ACADEMY, July 4), and Mr. Pennington takes occasion to point out some errors which appeared in the previous paper.

SOME time ago Mr. Allport, of Birmingham, showed that the Wolf Rock, which rises from the sea between the Land's End and the Scilly Isles, must be regarded as a *Phonolite*, consisting of nepheline, sanidine, hornblende, and a little magnetite. This was the first instance in which either the rock phonolite or the mineral nepheline had been found in these islands. By continued microscopic study of this rock, he has now become convinced that it also contains the rare mineral *nascum*; an interesting fact, since this species has

not been hitherto recorded in our lists of British minerals.

A BEAUTIFUL porphyritic rock, used to a limited extent in Ireland as an ornamental stone, is found in the island of Lambay and on the opposite coast, north of Dublin Bay. The Lambay rock is strictly a porphyritic felsite, destitute of quartz, and appears from its geological relations to have been intruded among the Lower Silurian rocks, subsequently to the period of the Old Red Sandstone. A description of the microscopic structure of this rock, by Professor Hull, has appeared in a recent number of the *Geological Magazine*. Crystals of a pale green orthoclase felspar are freely scattered through a colourless felsitic base, which is darkened by numberless grains of magnetic iron ore, and tinted green by dissemination of a mineral believed to be chlorite. Crystalline calcite and iron-pyrites are also present.

In some "Mikromineralogische Mittheilungen," published in the last number of Leonhard and Geinitz's *Neues Jahrbuch*, Professor Möhl, of Cassel, describes in detail the microscopic structure of a great number of eruptive rocks, including some rare specimens from Aden, Java, and Flores.

MINERALOGISTS have often been puzzled by the curious stones found at Beechworth, in Victoria, and known as "water-stones," or *enhydros*. Although not definite crystals, they are bounded by sharply-defined planes, and are, in fact, irregular hollow polyhedra, each enclosing a cavity which usually contains a liquid and an air-bubble, so that when the water-stone is shaken the bubble moves about, as it would do in a spirit-level. The *enhydros* consist of an amber-coloured chalcedonic crust, almost as hard as topaz, and the walls of the cavity are often studded with crystals of quartz. In the recently-published part of the Transactions of the Royal Society of Victoria will be found two papers on these stones—the one by Mr. E. J. Dunn, and the other by Mr. G. Foord. The enclosed liquid is found to be water, holding in solution a small proportion of saline matter. Although the probable origin of these curious bodies is discussed by these writers, it must be confessed that the subject is still somewhat obscure.

SOME "Geologische Bilder aus Italien" have been contributed by Dr. Rudolph Ludwig, of Darmstadt, to the Imperial Society of Naturalists of Moscow. A general sketch of the geology of the peninsula is followed by special descriptions of the salt-deposits near Alto Monte and Lungro, in Calabria; the principal Italian mines of copper, lead, and mercury; the boracic-acid *soffioni*; and the deposits of alum-stone and other minerals of economic value. These sketches are the result of personal observation during the writer's excursions to Italy on mining business.

IN some mineralogical notes communicated by Dr. August Frenzel to the last number of the *Neues Jahrbuch*, a new mineral is described under the name of *Miriqidite*. Its composition is not yet well established, but it contains oxide of lead; peroxide of iron, phosphoric and arsenic acids, and water. This is another of the new minerals obtained from the mines of Schneeberg, in Saxony.

AMONG the minor papers in the last number of the *Zeitsch. d. Deutsch. Geolog. Gesellschaft* we may refer to some palaeontological notes by Herr C. Struckmann of Hanover, in which he records the occurrence of *Terebratula trigonella*, Schloth., in the Coralline Oolite of Goslar in the Hartz, and the discovery of Upper Portland beds, with *Corbula inflexa*, near Ahlem, in Hanover.

WE have received the first three parts of a new geological treatise entitled *Die Geologie und ihre Anwendung auf die Kenntniss der Bodenbeschaffenheit der Oesterr.-Ungar. Monarchie*, by Dr. Franz Ritter von Hauer. In this work the Director of the Austrian Geological Survey is preparing an advanced text-book for students, with special reference to local geology. To anyone seeking an acquaintance

with the geological structure, the palaeontology, and the mineral resources of the Austro-Hungarian monarchy, this work will be peculiarly acceptable. So far as it goes the treatise is admirable; but as the completion of the work is promised within the present year, we may conveniently defer any detailed notice until the last part shall have appeared. The publisher is Alfred Hölder, of Vienna.

Das Ausland quotes a statement recently made by Professor Landois to the Natural History Society of Prussian Rhineland, to the effect that ants produce vocal sounds, though of a pitch inaudible to man. He finds they have a sound apparatus such as is found in the genus *Mutilla* and in the allied genus *Ponera*, Latr. Westwood has remarked on the "rather sharp noise" made by *Mutilla* (a sandwasp), when disturbed, and he attributed it to "the action of the large collar against the front of the mesothorax," but M. Goureau ascribed it, as Professor Westwood states, to the friction of the base of the third segment of the abdomen with the preceding joint. Professor Landois appears of the same opinion.

THE history of the domestic fowl has occupied the attention of Herr Jeitteles, and he states that although the species *Gallus* is not now wild in Europe, there were wild sorts there in the tertiary epoch; in the quaternary period of the Mammoth there were two varieties, one coming near, or identical with the domestic fowl in Western Europe. In the pile dwellings of the Stone period the domestic fowl does not appear, but it does in the Bronze period: it is found in Celtic graves. In Upper India and China, the domestic fowl, whose wild ancestor the *Bankiva* fowl is still living, spread in very early times through Central and Eastern Asia. It was common about the Mediterranean in the fifth (?) century, and known to Germans, Celts and Britons long before the time of the Roman Empire, and may have come from the East through Southern Russia, Poland and Hungary.

M. HOFFMANN has informed the French Academy that his two pupils who discovered a mode of obtaining vanilla from the sap of pine trees have established a flourishing manufacture. They obtain a hundred francs worth of vanilla from a tree of moderate size. The wood is not injured by the extraction of the sap. This communication was the more interesting, as cases of poisoning have lately occurred through the substitution of the wild for the cultivated vanilla.

HERR VOGEL divides stars according to their spectra into three classes:—(1) Those whose heat is so great that the metallic vapours of their atmospheres exert little absorption, and which show no lines in their spectra, or only feeble ones. These are white stars. This class he divides into *a*, which show very weak metal lines, and the hydrogen lines strongly, such as Sirius and Vega; and *b*, in which either single metal lines are very feeble or not to be seen, and the hydrogen lines fail (β , γ , δ , ϵ , Orionis); *c*, spectra showing the hydrogen lines clear and the line D_2 , which includes, up to now, only β Lyrae, and γ Cassiopeiae. His second class includes stars which, like our sun, have in their atmospheres metallic vapours, producing powerful absorption lines. These are yellow stars, and include stars giving very distinct metallic lines; some exhibiting numerous lines in the yellow and green. The hydrogen lines mostly strong, but not so much so as in Class 1. In some these lines are weak, and then numerous thickly-distributed lines are seen in the least refrangible part of the spectrum, as in Capella, Arcturus, Aldebaran. Others of this class show, beside dark lines and weak bands, many bright lines (T Coronae, stars in Cygnus, observed by Wolf and Rayet, and the variable R. Geminorum). In his third class he places stars whose temperature is so reduced that substances in their atmospheres enter in combinations, and which show more or less broad absorption bands. These are red stars. Among

them some exhibit, beside dark lines, dark bands in all parts of the spectrum, and the most refrangible portions are weak. The bands are plainest towards the violet (α Herculis et Orionis). Certain small stars show strong sharp bands towards the red, and feeble ones towards the violet. Further details will be found in *Astr. Nachr.*, No. 2000.

HERR MORITZ TRAUBE is led, by his researches in fermentation, to views of the action of yeast differing from those of Pasteur. He concludes that yeast germs cannot develop in a medium containing no free oxygen; that developed yeast, as Pasteur supposed, can multiply in suitable media without free oxygen; that Pasteur was wrong in supposing that in the propagation of yeast, when air was excluded, the oxygen required was taken from the sugar, as it was supplied by the albuminous matter present; that, in pure sugar solution, yeast can cause alcoholic fermentation in the absence of oxygen, but without propagating its own cells. He regards the fermentation as not necessarily a vital process of the yeast plant, which, he believes, contains a ferment acting in a catalytic manner. Catalysis is, however, merely a name, and an awkward one, for processes not understood. Fuller details will be found in *Der Naturforscher*.

MEETINGS OF SOCIETIES.

SOCIETY OF BIBLICAL ARCHAEOLOGY (Tuesday, November 3).

S. BIRCH, LL.D., F.S.A., President, in the Chair. The following papers were read:—1. "The Languages of the Cuneiform Inscriptions of Elam and Media." By the Rev. A. H. Sayce, M.A. The dialect to which the agglutinative idiom of the Persian inscriptions belonged was spoken by one of the four tribes of Susiania or Elam, probably by the Amardi. It was closely akin to two other dialects of Susiania, which have also been revealed by cuneiform discovery—those of the Cassi or Kossaeans and of Anzan or Susa—as well as to the modern Vogul-Mordvinian group; and was more remotely connected with the Accadian of ancient Babylonia. Two dialects of the latter may be detected, both of which are marked by such an extreme simplicity of agglutination as to render the Accadian the Sanskrit of the Turanian tongues. The Amardi were the primitive population of Media, the Aryan invaders not having appeared before the ninth century B.C. Additions were made in the paper to our knowledge of the Amardian dialect, an older form of which exists in the inscriptions engraved at Mál-Amir by King Suttur-Cit, and translations were given for the first time of brick-legends from Susa. All three Susianian dialects, together with that of the Cassi, were compared with the Accadians, and the origin and explanation of many grammatical forms, obscure not only in the modern Finnic idioms but also in those of ancient Elam, were thus pointed out.

2. "Four New Syllabaries and a Bilingual Tablet." Translated and edited by H. F. Talbot, F.R.S. These precious documents were brought from Nineveh by Mr. G. Smith this summer. They are marked S 23, 15, 14, 17, 12. The first tablet mentions a City, IS, *ittu* or *iddu*, probably bitumen (Herodot. Roman city IS: now called Hit, where bitumen still abounds). *Kish* (Heb. *Kat-tish*) (? our cotton) passus (byssus) = sis (Heb. *shish*), fine linen. The Accadians knew of white, black, yellow, and green cloth, perhaps also Tyrian purple cloth. On one of these tablets one word stands by itself, and, in Mr. Smith's opinion, this was to catch the student's eye and to refer him to the next tablet. Another tablet gives a list of the various classes of palace-guards of the Court: gatekeepers, guards of defiles, night watchers, fortress guards, prison warders, guardhouse warders of palace gate, of great city gate, of treasury, of royal granary, house guards, temple guards, field guards, orchard guards. Also the titles of honour,

lord and lady of the palace; the glorious epithets of the monarch (as the Profoundly Wise, Active, Intelligent). An Assyrian reader has written his way of pronouncing *sib*, viz. *siba*, a useful marginal gloss.

GEOLOGICAL SOCIETY (Wednesday, November 4).

J. EVANS, Esq., F.R.S., President, in the Chair. The Session was opened by a contribution to microscopic petrology, by Mr. J. Clifton Ward, of the Geological Survey. Mr. Ward gave a verbal abstract of his "Notes on the Comparative Microscopic Rock-Structure of some Ancient and Modern Volcanic Rocks," illustrating his remarks by rock-sections exhibited under the microscope, and by a large series of diagrams. Working amidst the ancient rocks of Cumberland, where the associated eruptive series forms so marked a feature in the local geology, the author has naturally been led to attempt a comparison between these old lavas and their modern representatives thrown out from our active volcanoes. Selecting as a starting-point the lavas of Vesuvius, he described in detail the microscopic characters of several of these volcanic rocks; and turning thence to the eruptive masses associated with the Silurian series in North Wales, he described in like manner the micro-mineralogical structure of many of the felstones and ash-beds, showing that these generally exhibited under the microscope a felsitic base or magma. Then passing to the Lake district of Cumberland, he dwelt upon the several points of resemblance and of difference exhibited by the ancient lavas and ashes of this area and the correlative rocks in North Wales. Some of these Cumbrian lavas are decidedly doleritic, and present a well-marked crystalline base, whilst others are rather felsitic; and as a whole they may perhaps be regarded as intermediate between the Welsh felstones and the true dolerites. This relation is, moreover, supported by the proportion of silica present in the Cumberland lavas. If, then, the old Welsh felstones represent the trachytic or acid series, these rocks in Cumberland might be taken as representatives of the trachydolerites; or it might be more appropriate to term them *felsi-dolerites*—a name which would indicate at once their relation to the felsites on the one hand and to the dolerites on the other. It is difficult to distinguish microscopically some of the altered felspathic ashes from true felstones, and the author maintained that in order to arrive at sound conclusions it was necessary that the microscopic, mineralogical, and chemical study of a rock should always be supplemented by a knowledge of its geological relations as observed in the field.

ROYAL MICROSCOPICAL SOCIETY (Thursday, November 5).

CHARLES BROOKE, Esq., F.R.S., President, in the Chair. The first paper read was by Dr. Joseph Fleming, Army Medical Department, describing Fungi he found on plants in the Himalayas, and which corresponded with European species of *Trichobasis*, *Uredo*, *Puccinia*, *Coleosporium*, &c.

The second paper, read by the Secretary, was entitled "Continued Researches into the Life History of the Monads by W. H. Dallinger, F.R.M.S., and J. Drysdale, M.D., F.R.M.S." It detailed numerous researches made by the authors on the plan of those mentioned in former papers, and described in our columns. Operating with a maceration of cod's head, they found peculiar forms at the expiration of twelve weeks. In another case a maceration of salmon's head was used.

One cod's-head maceration showed no trace of any monad, but swarmed with gigantic specimens of *Spirillum volutans*. Many other experiments showed great uncertainty as to the appearance of the monads desired, but a maceration that had been allowed to dry up, and which had contained them, produced them in abundance after being moistened with an exhausted maceration of the

same kind. This enabled a very remarkable series of developments to be traced, from extremely minute germs that had not been destroyed by the desiccation, though various states and stages. As in former papers, we find what appears to be a true sexual process, as well as propagation by budding or fission. One of the most remarkable facts ascertained is that true sexual germs even survive a temperature of 250° Fahr.

FINE ART.

THE FRENCH GALLERY.

THE Gallery at 120 Pall Mall no longer corresponds to its long-standing and still-retained designation of "The French Gallery." The catalogue speaks of the collection which opened on the 2nd instant as the "Twenty-second Annual Winter Exhibition of Cabinet-pictures by British and Foreign Artists;" and this is substantially correct, although the one work which lends a particular interest to the assemblage is far from being a "cabinet-picture." Of the collection as a whole we cannot speak in eulogistic terms. On entering, for instance, we passed a domestic picture by that smooth and elegant but rather rapid French painter Bouguereau (No. 2), named *The Little Marauder*; and, supposing that we should find further on several works of a higher calibre, we had left it unmarked in the catalogue. But, on quitting the exhibition, we discovered that this really counts among the prime examples in the room, and we were reduced to noting it accordingly.

The one salient picture to which we have referred is by Hans Makart, Piloty's favourite pupil—*Venice doing Homage to Catarina Cornaro*. It is, as the catalogue says, "35 feet in length, and 13 feet 6 inches in height, and contains forty-one figures, most of which are above life-size;" it formed a leading feature of the International Exhibition in Vienna. The notion propounded in the catalogue, that Venice "did homage" to Catarina Cornaro, the bride elect of the last king of Cyprus, is scarcely, we apprehend, correct. Venice had other schemes in her head than that of doing homage to this lady, who had, for political reasons, been pronounced a Daughter of St. Mark; and in fact, when her subsequent widowhood, and the death of her child, made her Queen of Cyprus in her own right, the Venetian state confiscated her sovereign claims, and merged them in its own. The subject of Herr Makart's picture might therefore be better defined as the Venetians *feeling* Catarina Cornaro as Daughter of St. Mark, and Queen-consort of Cyprus. It is highly desirable that the English public should acquaint itself with the handiwork of so prominent a man as Makart, and should appreciate with all cordial acceptance his great and vivid power of work, the truly exceptional force of his colouring and handling, his capacity for presentment and combination, the success with which he carries one pictorial theme over the whole surface of a vast canvas, without flinching and without misgiving. When these unusual merits have been handsomely allowed for, we have to ask what is the ultimate aesthetic value of such a performance, and we reply "not very much." It is essentially paint-work, rather than painter's work. Herr Makart follows here in the steps of Paul Veronese, and even, in a certain sense, treads pretty close upon his heels; yet, after all, his pacing is that of a *macchinista*. He is not, as Veronese was, a great festive patrician in the realm of art, lordly and self-possessed, temperate in his very excesses, moderate and exuberant at once: he is more a pageant-master, who knows what kind of display is expected of him, and finds in himself all requisites of force and of management for carrying it out. This large picture would be the best sort of drop-scene for the best sort of theatre: its place is not by the side of the *Marriage at Cana* in the Louvre. It lacks atmosphere, and we look throughout it in vain for one thoroughly fine head.

All this we say not as intending to derogate from the conspicuous merits of Herr Makart and his work, but as aiming to define their quality and relation. The painter is a young man, only thirty-four years of age, and, if he is a German Calibri of the nineteenth century, or in any other sense a great historical painter, we may hope that he will yet have ample opportunity of proving as much.

Passing from this picture, we have to look about for anything else worthy of particular regard. Certainly the *Ruth and Boaz* of Mr. Dowling does not respond to our quest. *A Visit to Grandfather*, painted by Blommers with breadth and skill, but with too much mannerism of sheeny and gritty surface, takes perhaps the first place; it has something of the style of De Hooghe, and something of that of the French peasant-painter Millet. The grandpapa himself is needlessly mean for pictorial treatment. *A Deserter*, by Mr. Holl, has force and surehandedness, without distinction; in these respects, conforming to previous works by the same artist. The expressions of the deserter himself, and of the shyly and gloomily sympathetic little girl who observes him under arrest, are well given. *Audifax and Haddumoth* is the title of a picture by Flueggen, representing two goose-herds, a youth and girl, both under adult age, the latter condoling with and endeavouring to solace the former. These proper names, and the story pertaining to them, are unknown to us: the work is skillfully painted, in a low tone of half light. *The Sonata Interrupted*, by R. Madrazo, shows us a Spanish lady who has risen from her pianoforte to con a letter and a bouquet. There is sentiment in the face, and much bright and clever painting, all somewhat marred by dexterity tending towards coarseness.

The First Cigarette, an oriental subject by Burgess; *Kept Waiting*, by Morgan, a small interior, not much unlike Tissot's recent mode; *The Seamstress*, by Pagliano, a large half-figure, vigorous, and not wanting in agreeableness; *An Unequal Contest* at cards between a Spanish muleteer and a Franciscan, by Vibert, carefully and completely rendered, both in expression and in detail; and a small figure by A. Gues, *The King's Jester*, may be looked at; while *Hermione*, by Mr. T. F. Dicksee, and three other specimens by this artist and Mr. J. R. Dicksee, obtruded here on the unwary eye, should be heedfully avoided. Forewarned, forearmed.

The landscapes include a very cleverly hit piece of effect by Munthe, *A Winter's Eve*,—also by the same painter, *A Wintry Day*, a shade less successful; two little works by Mesdag; *Returning from Work*, by C. E. Johnson, commendable; and *The Welsh Dairy Farm*, an attractive small specimen of what our veteran master John Linnell was doing as long ago as 1847. Cattle are well treated by A. Braith in *Feeding-time for the Calves*; and fruit by Mdme. Muraton in *Peaches and Greengages*.

HALSWELLE'S VENETIAN PICTURES.

UNDER the name of "Twelve Months in Venice," a considerable number of oil and water colour pictures by Mr. Keeley Halswelle, A.R.S.A., are now on view at Messrs. Agnew's Gallery, No. 5 Waterloo Place: fifty subjects are entered in the catalogue. "Their fidelity to the places represented," says Mr. Halswelle, "may be relied upon, from the fact that all were drawn and painted on the spot, without any attempt to 'make pictures,' or to alter or vary any effect or form in nature."

Mr. Halswelle is a painter of more than common force, and proportionate skill, founding his style principally upon that of the late Mr. Phillip. Whatever he aims at he can do, so as highly to impress the half-trained spectator, and partially to content the connoisseur. Up to a certain point, we respect and enjoy his work: being quite prepared, however, to find that the point in question is some way below the utmost limit of the artistic

opportunities offered by such a place as Venice, and then to look to other painters for a higher grade of satisfaction.

The largest picture in the room is named *The Elevation of the Host*, and is not Venetian in subject. It was executed in Rome in 1872, and has been exhibited before, if we mistake not. Another well-sized picture, inscribed *Rome, 1874*, is taken from a bare-walled Venetian chapel; three benches are filled with a characteristically painted congregation of the lower class, and a small girl kneels in front before the unenriched altar. This is a work of superior ability, capable of becoming decidedly popular. Other subjects which we may particularise are the *Palace on the Grand Canal near the Casa d'Oro*, rather spoiled by the dressy women in the gondola; *Interior of San Marco* (12), clever, but not much like the place in colour; *A Fruit Boat going to Market, Palazzo Dario in the background*; *Sunset on the Laguna* (18); *The Bridge of the Rialto, Moonlight, water-colour*; *Sketch of Effect of Sunset from a Balcony on the Grand Canal looking towards the Accademia*; and *The Steps of the Salute*, littered with picturesquely treated groups of Venetians.

THE NEW BRITISH INSTITUTION.

LIKE the so-called French Gallery, this is a collection of works by artists of all nations; for England is at the present day, in art-manners, the least insular and most cosmopolitan of countries. The collection, opened on the 2nd instant, is a rather small one, about 210 works; and, if we call it on the whole trivial, we do it no injustice. There are, however, a few pictures of fair quality.

Among the figure-subjects we find nothing more worthy of a word of hearty praise than the small and sketchily executed work of Mr. Adams-Acton, named *Iola di Sant' Elena*; representing a gondolier, of the least elaborately-costumed class, with his little boy, floating up to one of the remoter islands of the Venetian group. The gondola goes peak foremost, greatly foreshortened to the eye; the child sits by the peak; the gondolier lounges in his bark, with a fiddle beside him; the lagoon-water is green like glass, and hardly less smooth. The figures are designed and posed with uncommon spirit; and throughout one discerns an artist who has a decided point of view of his own, and knows how to make it tell in his work. *The Inundation*, by J. Verhas, portrays a little girl freely sousing from a water-pot a plant which is set up on a leather-covered chair. This picture belongs to that class of strictly reproductive art which has been much in vogue of late years on the continent, and not a little in England as well: the aim is to represent every object, from a human being to a brass-headed nail, with exact and indifferent verity,—not however with punctilious finish, but in a forcible broad style. Everything is realised; nothing is over-enforced, or put forward with zealous predilection. The resultant works are able and telling; not interesting, certainly not intellectual, and sometimes to be called stupid. The picture of M. Verhas, though somewhat opaquely executed, takes a very creditable rank in this line: its masculine merit contrasts with the wax-work vacuity of a painting. *Mamma's Birthday*, by another artist bearing the same surname, F. Verhas. *A Glass by the Way* is a very clever minute picture by Spiridon, in the manner of Meissonnier or his followers: we see an old Italian country-town, with its graded pavement offering a steep ascent, and a few travelling-companions pausing to drink. The costume belongs to a late date in the sixteenth century. The lifelike aspect of the subject would be all the more evident, if the horses or mules of the travellers were brought into the composition. Mr. Calthrop, like M. Heilbuth in Paris, is evidently bent upon working the characteristic aspects of Roman Catholic ecclesiasticism. *Ultramontanes, St. Peter's, Rome*, shows us a bishop and a priest in intense

colloquy, and a Capuchin prostrated on the marble pavement: a niche-monument to one of the Popes occupies the central background-space. The bishop and priest may perhaps, to judge from their faces, be Frenchmen rather than Italians. They are both inveterate fanatics; the former having more of a worldly turn, and the latter of the ambition to undermine and domineer. The tone of the precious marbles, with their decorative variations here and there, is good, and the whole work is that of a capable man. *The Bénitier, St. Peter's*, displays merit of a like kind, though the subject-matter is slighter: a little girl is reaching up for the holy water in the bénitier, so well-remembered by travellers on account of the gigantic infant cherubs who support it: two Franciscans are seated hard by.

Other figure-subjects worthy of some attention are the *Ancient Gallant*, a Spanish character-piece with much expression not of the most refined kind, by Daunas; *An Old Nook in Paris*, by Miss Sophia Beale, where we see some sisters of charity going out with their umbrellas on a sloppy day, their abode being decorated with a tricolour flag, and the half-seen "Fraternalité" of a republican inscription—a small picture with a good deal of well-caught subject-matter, fairly executed; and *A Mediaeval Student*, by J. Forbes-Robertson. *Matins* is a showy production, by no means of a high order of excellence, by Gianetti—a youthful lady of mediaeval Italy entering a church.

The name of Lamorinière is a guarantee for at least one fine landscape in the gallery. *After Sundown*, by this painter, presents a farmhouse with a swampy stream in front, and dark grassy paths—all these, along with a shepherd and his sheep, half defined and half obscured in the late orange and grey sundown—the lumour waning, the dusk thickening. Mr. G. F. Teniswood also has a poetic perception of twilight effects: witness his *Mountain Twilight* over a lake and its peaked and pinnacled rocks; likewise his *Early Dawn*, in which the entire colour-effect simulates that of a prism—the richly tinted streaks appearing in the central horizon-line of sky, and the deeper hues and tones, feelingly varied, coming in the upper and lower spaces. Mr. William Linnell sends a small but fine landscape-composition with figures, having a certain heroic quality worthy of its subject—*Ulysses driving the Oxen sacred to Apollo and Diana to slaughter*: there is elevated treatment of tree-form in *The Hireling Shepherd* by the same artist. *Sunset in Equatorial America*, painted by the late American landscapist Mignot, revives our regret for the death of this very capable painter, conversant as he was with the exceptional scenery and effects of regions unknown to well-nigh all artists, whether of our own or of preceding times. We can commend likewise the *Afternoon of Siebels*, a shepherd and his flock under a tree; *Off Hastings*, by De l'Aubinière; *A Calm*, by Clays; and *Above the Mill*, by Miss E. Rooke. *Morning on the Dunes*, by De Haas, is a very able cattle-picture, painted with observable solidity somewhat in the style of Troyon: three cows are portrayed, facing right out towards the spectator. S. Gessa is a skilled executant of still-life, as his *Oranges and Oysters* testify.

W. M. ROSSETTI.

NOTES AND NEWS.

AN interesting proof of what may be effected by judicious restoration is, we learn from the German papers, afforded by the result of the Viennese painter Schelein's successful manipulation of the Holbein table of Zürich. This invaluable work of art, which had been given up as wholly past restoration, and which had long been consigned to the least regarded lumber-room of the Zürich City Library, is now nearly perfect again, both as to details of composition and brightness of colouring. The picture known as *Holbein's Table*, which ranks as one of the earliest of the great master's authenticated works, was

painted on a beech-wood slab, measuring about 4½ feet in length by 3½ feet in width, and had been so often varnished that at length nothing but the coat-of-arms in the centre was to be seen. Herr Schelein has now succeeded in removing the superincumbent coatings, and has revealed the work of the great German master, who at the age of seventeen completed this interesting picture at the instance of the Bär-Brunner couple, whose house and home-life it was intended to commemorate. The Bär-Brunner arms, which constitute the central point of the composition, and are, perhaps, introduced in allusion to the husband's office of standard-bearer to the town of Basel, are surrounded by an immense variety of groups illustrating, both symbolically and realistically, the every-day course of life in the kitchen and larder of well-to-do burghers of those times. On one side rocking-horses bestridden by marionettes parody the achievements of the tournament, while on another side of the board a series of the most playfully conceived groups of figures exhibit maid-catching and bird-catching with bright lures, golden nets, rose-traps, and decoys of every kind. All the details of the picture are now perfectly restored, and when the few places where the paint is destroyed have been temporarily covered over with water-colour to facilitate the process of engraving, to which it has been determined to submit the work, it will be again consigned to the custody of the authorities of the Zürich Town Library.

THE Italian Gallery in the Louvre was reopened last week.

PARISIANS have of late been expressing considerable dissatisfaction because the statue of Napoleon I., their beloved Petit Caporal, has not as yet been set up in its place on the top of the restored Colonne Vendôme. M. de Chennevières recently wrote to the *Figaro* on the subject, stating that he was not in any way responsible, as some correspondent had implied, for the delay. It appears that the National Assembly voted a sum for the restoration of the column, which was evidently meant to be applied to the whole work, statue as well as bas-reliefs; but when the statue came to be examined it was found to have suffered so much injury that it was deemed necessary to recast it. Fortunately, the model of half life-size was still in the *atelier* of the sculptor, M. Dumont, and its recasting would not, one would have imagined, have been a matter of great difficulty. It has been made so, however, and a supplementary grant has had to be voted by the National Assembly for the work. The *Journal Officiel* stated last week that the statue was not as yet ready, but that when it was it would be raised to its place by the same simple means as were employed in 1863, so that there was no necessity for the present scaffolding to remain, and it would soon be taken down.

In the course of the recent explorations of the Esquiline quarter of Rome, a number of bas-reliefs and other pieces of sculpture have been found belonging to a temple of Jupiter Dolichenus. Among other sculptured remains, a nearly perfect statue of the god has been recovered. The pedestal bears several votive inscriptions by manumitted slaves and seamen of the Roman fleet at Misenum. The exploration of this district of Rome has also been successful in bringing to light a large number of Etruscan graves, and of others belonging to the times of the Empire, in which are some highly interesting cinerary vessels, and numerous sculptured fragments of marble and porphyry sarcophagi. In the old Villa Palombaro a well-finished Venus' head was found, together with a Mercury carrying his caduceus, various bronze vessels, and some sculptured marbles; while at the Via Babuino remains of mosaic floors and pavements have been laid bare, together with portions of a marble sarcophagus ornamented with alto-reliefs of genii.

THE Imperial Academy of Arts at Vienna has in contemplation to bring out a work which is to give photographic representations of all the Greek

alto-reliefs that have formed part of the decorations of graves, funeral urns, or other depositories for the remains of the dead. More than a thousand photographs have already been prepared for the purpose, and the work, of which the first part is nearly ready, promises to supply a want in the literature of Hellenic art.

AFTER prolonged discussion, it has been determined that the proposed Technical Museum for Bavaria shall be located at Nürnberg, and not in the Bavarian capital, as the people of Munich desired. The Minister of the Interior has superintended in person the preliminary arrangements for its complete organisation, and was present on October 25, when the buildings erected by private local contributions for the purpose of serving as a technical school were formally opened. It was announced on the occasion of this ceremony that the King of Bavaria intended to endow the institution with an adequate sum for the distribution annually of a definite number of medals and other prizes to the best students.

THE Academy of Arts at Vienna has recently bought an interesting collection of Albert Dürer's copper plates and woodcut engravings, the history of which can be accurately traced back more than a century, when it first came into the possession of Goethe's friend and correspondent, Heinrich Sebastian Hüsgen, of Frankfurt-am-Main. On the death of Hüsgen in 1808, this collection, together with a lock of hair reputed to have been taken from the head of the great master, was purchased by Friedrich Heinrich Schlosser (a nephew of Goethe's brother-in-law of the same name), whose widow bequeathed it to Professor Steinle, of Vienna, her husband's nephew, through whose heirs it has now passed by sale to the galleries of the Imperial Academy.

It is reported that Dr. Déthier, Director of the Museum at Constantinople, has, in conjunction with the American Consul-General, Signor Cesnola, secured an interesting collection of antiquarian objects in the island of Cyprus. The mass of treasures accumulated by these indefatigable explorers was so great, that more than a fortnight had been absorbed in packing the forty-four large crates and thirty chests required for their reception. The discoveries of Messrs. Déthier and Cesnola include several cylindrical gravestones bearing Greek inscriptions which may probably be referred to the early Christian ages and the closing period of paganism; but here, as in numerous other remains of the same kind, there is no trace of a cross or any analogous religious symbol.

M. F. GROBON, a French artist, has lately exhibited specimens of his ingenious reproductions of historical monuments and old châteaux, in faience. The well-executed models in faience are artistically coloured in the natural tints of the originals, and thus a reproduction is furnished more durable than the building it represents, for time, so destructive to stone, has little effect on faience.

THE death of the French painter M. Dedreux-Dorey, at the advanced age of eighty, took place a few weeks ago. In the discourse pronounced by M. Mathieu de Sévres at his funeral, it was stated that Géricault's famous picture *The Raft of the Medusa*, was preserved to France by his patriotic endeavours. It appears that at the sale of Géricault's paintings that took place shortly after his death, this picture was the subject of a lively competition between several foreigners and picture dealers, whose avowed object was simply to make a profitable speculation out of it. Dorey, however, was determined that the *chef d'œuvre* of his master and dear friend should not be lost to France, and he resolutely outbid every bidder until at length he obtained possession of it for a little over six thousand francs. After this an American offered 25,000 francs for it, but he refused to part with it except to the Louvre, to which he sold it in 1828 for the same sum as he had originally given for it. Dedreux-Dorey,

though belonging as it were to the past, practised his art until within a few weeks of his death. He was not very remarkable as a painter, but appears to have been highly esteemed as a man.

VASARI in his life of Sansovino mentions that that artist executed "a fine statue of Hercules for the Duke of Ferrara." Strange to say, no other writer has ever alluded to this work, and it has been so completely forgotten that it will be a pleasant surprise to most art students to hear that it is still in existence. In the *Gazette des Beaux-Arts* for last month, Il Marchese Giuseppe Campori, who some time ago published in the same journal some important new documents concerning Leonardo da Vinci's statue of Francesco Sforza, makes known some interesting particulars respecting Sansovino's long forgotten work, which, more fortunate than Leonardo's masterwork, is still preserved in the little town of Brescello, in the territory of Reggio. It appears that in 1500, Hercule II. d'Este, Duke of Ferrara, desiring to have a statue of Hercules to place over a gateway in Modena, desired his ambassador at Venice, Girolamo Ferussi, to commission Sansovino to execute it. The wily ambassador, hoping no doubt to get it a little cheaper by that means, did not tell Sansovino that it was for the Duke, but made out that it was a commission from a simple gentleman of Ferrara. Sansovino accordingly undertook it for 120 ducats, intending to leave its execution principally to his pupils, and only when the negotiations were complete found out that the statue was really for the Duke, and would be placed in a conspicuous public position. Many delays attended its execution; the block of marble could not be obtained; and Sansovino, tricked to some extent in its price, probably did not hurry with his unprofitable commission, in spite of the importunities of the Duke and his ambassador, between whom many letters passed on the subject. Sansovino also wrote himself to the Duke, excusing his delay; and at last, after much angry feeling had been excited, Ferussi had the satisfaction of announcing the "happy completion of the statue" to his ducal master. This was in June, 1553, so after all Sansovino had only been three years in executing this colossal statue. But meanwhile Hercule d'Este had changed his mind as to its destination, and instead of having it placed over the gateway at Modena, as at first intended, had it taken to Brescello, and placed on a high pedestal in the middle of the Piazza. Here it remained for a century and a half, until 1704, when the fortress was taken by the French, and the statue thrown to the ground. No attempt was made to restore it, and it remained in an utterly neglected condition until 1727, when a patriotic abbé named Talenti had it set up again on the pedestal on which it still stands, on the Piazza at Brescello. Its history, however, by this time had been so completely lost that it was generally supposed to be an antique. Talenti, who wrote a history of the town, a work still preserved in manuscript, ascribed it to a Greek sculptor, and both Muratori and Tiraboschi speak of it as a work of ancient art. By restoring it to its true author, and by publishing these interesting particulars concerning its history, found among the archives of Ferrara, Il Marchese Campori has revealed another important source of art history, besides those that we already owe to his researches.

In the current number of the *Zeitschrift für bildende Kunst*, Robert Vischer gives us the results of his "Studies at Siena." The Siennese passed among their countrymen as being light-hearted and ardent in temperament. Dante speaks of them as being also very vain—

"Or fu giammai
Gento sì vana come la Senese;"

but these qualities do not appear in their art, which retained its sweet religious melancholy long after the more progressive art of Florence had developed into naturalistic beauty. Duccio, Simone Martini, the Lorenzetti, Lippo Memmi, and other

masters of the Siennese school, are commented upon by Herr Vischer, but no new facts concerning them are given.

In an article upon Costume and Fashion (*Tracht und Mode*) Veit Valentin considers the subject of dress from an aesthetic point of view, and more especially in its relation to the history of culture. Dress had formerly a symbolic signification; it defined the rank, the calling, and even sometimes the religion of the wearer. Thus the Mahometans in Egypt obliged the Christians to wear blue, and the Jews yellow turbans, in order to distinguish them from the faithful followers of the Prophet, whose favourite colour was green; and the rich costumes of the Middle Ages betokened the rank and often the principles of their wearers. These symbolical costumes were in many cases continued long after their original meaning had been forgotten, and we may trace their survival at the present day in the dress of our soldiers and in other official costumes. Fashion, on the other hand, tends to level distinctions, and in times of social revolution especially, it exercises a powerful progressive influence. In the history of culture it has perhaps even more significance than the less mutable costume. The subject is to be continued. An etching by L. Vischer from a simple landscape by Ruysdael, and another from a clever *genre* picture by Ed. Grützner, form the chief pictorial attractions of a somewhat dull but learned number.

THE STAGE.

IRVING IN "HAMLET."

IN all that Mr. Irving has hitherto done—before the representation of last Saturday night—he has sought perhaps especially to be original and intense. He has been determined to create, as well as to interpret, and in some of the originality there has been eccentricity; and in some of the intensity, extravagance. To get at some new standpoint would, like enough, have been the aim of most of our actors in attempting *Hamlet*—which he attempted last Saturday. The effort of course would have resulted in failure; but probably it would have been made. The difficulty of making any mark at all in a stage character loaded with traditions, and round which a whole literature has clustered, would have been recognised, and in novelty and strangeness only would have appeared the one remaining chance. Mr. Irving has resisted all such temptation as this. He has set himself more resolutely to interpret than to invent. It is easier in such a part to dazzle than to satisfy. But Mr. Irving has satisfied, by the sheer mental force and subtlety of an always restrained interpretation.

For, of the old extravagance, there remains now hardly a trace. Writing hurriedly, soon after the performance, we can recall no trace at all. Most of us have cause to know that heretofore, with all his merits, Mr. Irving has broken now and then into rant. It was the remark of a Frenchwoman, after Saturday's performance, that this was the first Hamlet who never ranted at all. Twice, indeed, he tears a passion to tatters, but in one of these cases the text justifies him, and in the other it obliges him. The first is his moment of anger with himself for seeming weak in action beside the sympathetic passion of the player:—

"What's Hecuba to him, or he to Hecuba,
That he should weep for her? What would he do
Had he the motive and the cue for passion
That I have?"

That is the suggestion of it, and then begins the raving, suddenly arrested by a fresh thought of self-contempt:—

"This is most brave,
That I, the son of a dear father murder'd,
Prompted to my revenge by heaven and hell,
Must, like a whore, unpack my heart with words,
And fall a-cursing like a very drab."

That is the justification of it, if justification you need; and the second instance is when Laertes

has leapt into Ophelia's grave, and with grief "that bears such emphasis" "conjures the wandering stars." Then Hamlet, not to be outdone, rants also:—

"An thou'lt mouth,
I'll rant as well as thou."

And afterwards, remember, he tells Horatio that the "bravery" of Laertes' grief put him into a "towering passion." But in the main, the absence of all exaggerated emphasis is to be commended in this latest Hamlet. Sometimes, indeed, the abstinence of emphasis is greater than is customary—greater, perhaps, than is needful, though on the whole good. The traditional exits are disregarded: of the final couplets no actor's "point" is made. Speech ceases as in common talk—dies out like embers of a fire.

Of course there are frequent flashes of passion, and one more brilliant than the rest. That one carries away the audience, leaving the actor still fully in possession of his means. It occurs in the play-scene (act the third) when Hamlet sits as usual at the feet of Ophelia, within good view of the King, and watches him narrowly while in the background the players play their tragedy. Mr. Irving lolls upon a wild-beast skin, and toys with it, and yawns a little while the players are mouthing what is not much to his purpose. His attention is more fixed as the application draws near, and excitement grows on him as the thing proceeds "Gonzago is the Duke's name; his wife Baptista you shall see anon: 'tis a knavish piece of work"—he is watching almost too eagerly to be closely keen—"but what o' that? Your Majesty and we that have free souls, it touches us not"—*does it, though?* he is asking by his eyes—"let the galled jade wince: our withers are unwrung." And he waits again for a moment. Then, and now no longer explaining and no longer with civil though eager reassurance, the actor, crawling unawares in his excitement away from Ophelia and towards the throne, points at the King, and hisses out like an accusation, "He poisons him in the garden for's estate. . . . You shall see anon how the murderer gets the love of Gonzago's wife." Whereat the King rises, and it is not so much by his rising, nor by Ophelia's word of surprise, as by the actor's seething excitement, that you perceive the enterprise has succeeded. The gradual growth of this excitement, now subtly checked, now varied by a word of reassurance or commentary—"the story is extant, and writ in choice Italian"—and now overmastering his will, so that he leaps in momentary wildness, when the King has gone—all this told so plainly upon the audience that it forgot to cheer. It hardly knew its own mind for a minute, as to any expression of approval. But when somebody began to applaud, the contagion spread. Clapping of hands got louder and louder, but the audience was not content. It rose to its feet and fairly satisfied itself at last with a great roar in recognition of this power. Of course it was a friendly audience, but genuinely moved—and justly.

Marked then not only by absence of exaggeration wherever exaggeration is most common, but by one legitimate display of intensity the like of which I have never witnessed, Mr. Irving's Hamlet commends itself to the thoughtful by the thought he has himself expended on it—thought so various, and with a result so rich, that you cannot class his Hamlet as embodying this or that man's view alone, as purposely like or purposely unlike any other that may have been imagined by English or German critic, or realised by English or French actor, from Kemble to Fechter. Mr. Irving has not taken up the acting of Hamlet as a hurried attempt, to be justified, as best it might, by a stray exhibition of genius. He has worked at its preparation with the utmost diligence, and there is not one reading of a single passage which is without its own intelligent purpose. Let us come to details, and begin early. He lets you see that in his mind there is some sense of the dif-

ference in rank as well as the more obvious difference in intimacy, in the very pronunciation of the two names, "Horatio"—"Marcellus." He makes his first long address to the Ghost with courage and earnest entreaty, but a moment after—when there has been time for Horatio to speak, and to observe closely the manner of its "beckoning"—Hamlet is lost in the wonder of the apparition. He says "I'll follow thee" in the tones of one who is under a spell, and this passive fascination only gives way to active and conscious will when his companions seek to keep him. Their hold of him awakes him, and in his "Unhand me, gentlemen!" there is a new-born determination. But Mr. Irving soon, and rightly, drops the determined air. He remembers, I suppose, what Goethe declared to be the purpose of the play—"to represent the effects of a great action laid upon a soul unfit for the performance of it." Hamlet is no sooner fully resolute than he begins again to be irresolute. The cry of his death has been in fact the cry of his life—"Had I but time!"

There is a remembrance of his fancy for Ophelia in his vow to the Ghost. You see it in the new Hamlet's eyes when he declares that the Ghost's commandment of vengeance—

"all alone shall live . . .
Unmixed with baser matter."

And yet Mr. Irving represents the feeling for Ophelia as very genuine and deep. There is a new sadness in his "Get thee to a nunnery," and throughout his whole scene with Ophelia, though there is nothing to imply that his care for her had been a quite absorbing passion, yet there is more earnestness than accords with Wilhelm Meister's opinion that the love for Ophelia was but the "still presentiment of sweet wants."

That Hamlet was naturally as contemplative as Jacques, though not so bitter, is conveyed by Mr. Irving in his first entrance. His humour, Goethe says, was of the mind more than of the heart. He could jest like another, but was no more a buffoon than Rabelais was. And so, with Mr. Irving, the sense at first of his self-questioning and all-questioning temperament, and then of the particular and accidental problems which this always problem-haunted nature is born to solve, is never lost. His abstraction is always with him, though not always upon the surface of him. He jests lightly with the players—he can talk of the weather with Osric—he talks of it as naturally as any dull Cockney of to-day. But below his lightness there is always this abstraction, and it is most visible when he is most at home. That is a delicate touch of the actor's which makes him when Horatio is offended with his "wild and whirling words" say, with an indifference too obvious to be permitted save in the presence only of his most chosen intimate, "I'm sorry they offend you." It must be quite clear to Horatio that he doesn't care a straw about it. His thoughts are not in the chance phrase of regret. But before anybody else he would have veiled their absence with a more careful civility of manner.

As in Mr. Irving's reading of the words "unmixed with baser matter," there is distinctly seen to be a reference to his own thought for Ophelia, so in his passage of praise to Horatio—at the moment at which he wanders from personal praise to general praise of those

"Whose blood and judgment are so well commingled
That they are not a pipe for fortune's finger
To sound what stop she please—"

there is distinctly seen to be a reference to himself—a keen and undeceptive acknowledgment of his own vacillation, and not another's. But one might go on for a long while, instancing subtleties of expression which are the fruit only of the most painstaking search—subtleties which, when they are guided, as they are guided here, by sagacity, and not ingeniously tortured out of things which are quite plain, make a performance what a Shaksperian performance ought to be—more

luminous than dazzling; though this performance is at one point very dazzling indeed.

Each one for himself will notice little points which seem to him amiss. The actor did not convey as much to me as I should have liked, when, brushing the arras aside, he found it was Polonius dead, and not the King. Again, he seemed rather needlessly enraged with Rosenkrantz and Guildenstern for their implied supposition that while they could not play upon the recorders, they could know his "stops," and pluck out the heart of his mystery. And, to name a smaller point, he made too frequent use of the same spot on the same pillar of the palace; twice going up to lean on it as if it were made, above all other pillars, to be leant against (which indeed it is, if, as I fear, in actor's slang, it is the only "practicable" one), and once going to that very same spot to press his tables against it, while he writes upon them.

As to the mere delivery of Shakspeare's words,—apart from action and from facial expression—Mr. Irving's mannerism is far less noticeable than of yore. While light, indifferent, and colloquial with the light things—though always with a strange preoccupation—the deeper things are so said that you are profoundly satisfied; and remember, when it is a question of the deeper things of *Hamlet* no one is likely to be satisfied at all with ease. In praise of this delivery, we may single out one passage, given with special profundity of meaning. He is anticipating death, and it is impossible to give a greater pregnancy and depth to any words than Mr. Irving gives to these: "If it be now, 'tis not to come; if it be not to come, it will be now; if it be not now, yet it will come: the readiness is all." Here is a passage of which Polonius or the like of him would only too easily have "cracked the wind," but Mr. Irving delivers it with the natural air of slow but spontaneous thought. In this wise he may realise the ideal Hamlet of Hazlitt—a Hamlet who should "think aloud."

The thing best done, next after Mr. Irving's Hamlet, is the Polonius of Mr. Chippendale: a very excellent study of that wholly Shaksperian compound of imbecility and experience. And, next to that, comes I suppose the rendering of the Ghost by Mr. Mead, who knows how to vary, only within the proper limits, the utterance of the perturbed spirit. Mr. Conway is a sprightly and foppish and pleasant young Osric—the character is generally assigned to weaker hands than his. Mr. G. Neville is Horatio, and is careful, with a touch of commonplace. Mr. E. Leathes is Laertes. His speech is good and his appearance good, and he may acquire greater variety of action and facial expression. The King is discreetly played by Mr. T. Swinbourne—a sound, not brilliant actor, with whose bearing and delivery, fault cannot reasonably be found. The first Gravedigger—a part which no comedian, however eminent, has been heard, I believe, to refuse—is played by Mr. Compton, who has known his business any time these thirty years, and cannot astonish us in this. The sententiousness of the clown suits his mannerism, but the Gravedigger's part is nevertheless better when read than listened to—the grim jester appears so late in the play that it is permissible by that time to be impatient for the end.

Miss Isabel Bateman represents Ophelia in a theatre which has seen the best Ophelia of modern times. Miss Bateman is an actress whose work deserves to be considered respectfully, as it is always intelligent and earnest. Her mad-scenes are acted with some power, if her earlier scenes are acted with little poetry. Not but that she looks well in the earlier scenes, besides. It might perhaps be a pleasant Gretchen followed by Faust in the street; but when she speaks, moves, listens, it does not seem to be with Ophelia's sensitiveness, or with her flower-like simplicity. The Queen is played by Miss Pauncefort, who represents her as more sinned against than sinning—represents her as weak, sensuous, affectionate. In

her fright, she is not very natural, though she is very loud. "The lady doth protest too much, methinks."

But it is for Mr. Irving's Hamlet—for that, and nothing else—that the audience of last Saturday went to the Lyceum, and an impression of Mr. Irving's Hamlet has been perhaps sufficiently analysed above. It may be summarised here, in a last word, by saying that his interpretation, notwithstanding a few errors, is vigorous, graceful, thoughtful, and sagacious beyond contemporary experience. It is a picture touched not seldom by the light of undeniable genius.

FREDERICK WEDMORE.

Green Old Age—now played at the Vaudeville after the comedy—is a farce interspersed with songs. It is the kind of thing our grandfathers used to like, in the dark days before burlesque and the cancan; and Mr. Reece has done his part to make us like it again. It is a pleasant little trifle: easy to see, impossible to criticise. We meet two gentlemen who appear to have been married under circumstances like to Sir Peter Teazle's. It is now some time ago that their brides made them the happiest of men, and they have been the most miserable dogs ever since. They lost all comfort in life before their friends had done wishing them joy, and when we meet them they are a prey to jealousy and suspicion—undignified Othellos of the *bourgeoisie*; forced, so that they may satisfy themselves and be wretched, to assume the characters of two old pensioners, respectively of Greenwich and of Chelsea, by which means they will watch, unrecognised, the movements of their wives. It is difficult for them to play their parts when each has nothing to do but to talk characteristically to the other, so that the other may be deceived. The sham old soldier hardly knows, even by the aid of a book, whether 'tis usual to plant a bastion on a demi-lune or a demi-lune on a bastion. The sham old sailor can't tell you when he fought at Trafalgar, but retires upon general assertions as to his "green old age," and is great at beginning anecdotes which he has no reasonable hope of finishing. Each man recognises the disguise of the other, but each believes himself unrecognised. The difficulty waxes greater when the young wives appear, punctual to their rendezvous with two young men, who later on prove to be their long-absent brothers. But in the interval there is so much that is inexplicable and unsatisfactory, that one of the heroes is well nigh justified in deducing from his own experience that marriage is "an insane desire to pay for somebody else's board and lodging," and though each hero is delighted at the ludicrous perplexities of his comrade, each has to suffer keenly for himself. Of course it is all cleared up in the end—the heroes are appeased and the heroines forgiven. It is a merit of the piece that it affords to Mr. James and Mr. Thorne many situations at which the playgoer must laugh. The excellent dolorous humour of the one and the excellent crabbed humour of the other, find as fair a field for their display as anything which is beyond the limits of comedy can possibly afford them. There are no other parts of importance in the piece, though Miss Roselle—a bright and vigorous actress of comedy—appears in it. So does Miss K. Bishop, but she again has little to do but to wear a pretty gown becomingly. There is some old music that is quaint and telling, and some new, by Mr. Clay.

RICHARD THE THIRD is the part fixed upon by many of Mr. Irving's admirers for him to play next, but it will under any circumstances be some time before the excitement of last Saturday at the Lyceum is renewed.

WE hear that it is now exceedingly doubtful whether Mr. and Mrs. Kendal will go to the Prince of Wales's Theatre after Christmas. Another London engagement is spoken of for them.

MR. HENRY J. BYRON's latest contribution to stage literature—*Oil and Vinegar* by name—was produced at the Gaiety on Wednesday night; but we defer a notice of it until next week. It was well received.

MR. H. S. LEIGH's version of *Le Roi Carotte*—Sardou's first spectacular piece—was revived at the Alhambra Theatre, early in the week. The fun of the piece rests with Messrs. Paulton and Worboys—two low comedians of an approved type. The singing is done chiefly by Miss Lennox Grey and Miss Rose Bell.

THE ever popular *Tricocche et Cacolet* has been revived at the Palais Royal.

A WHOLE page of the Paris *Figaro* is absorbed by the sensational announcement of the last twelve representations of *Orphée aux Enfers*.

Giroflé-Girofla is just about to be played for the first time in Paris. The Théâtre de la Renaissance will there be its home.

Madame l'Archiduc—Jacques Offenbach's new piece—has been successfully produced at the Théâtre des Bouffes, with M^{me}. Judic in the principal part.

MDLLE. ROUSSEIL, a tragic actress whom her admirers, and those especially who are weary of Favart, declare should be at the Théâtre Français, has to put up with the little Théâtre de Cluny as a substitute. She is engaged there from March 1, owing to a recent success of hers; but she pays a flying visit to the Odéon before then, being specially retained for a long piece entitled *Philippe II*. Hitherto her greatest success has been in *L'Article 47*—that dreary play of Adolphe Belot's in which M^{me}. Pasca appeared before a London audience last season at the Princess's—and her part in this will probably remain the sort of part to suit best M^{lle}. Rousseil, who with some undoubted talent is too much lacking in such personal distinction of voice and manner as is needed to reach eminence in the high comedy or classic tragedy of the Rue Richelieu.

THE *Demi-Monde* of Dumas has at last been performed at the Théâtre Français, before an audience which was cold at the beginning, as all audiences are which come to compare the effect of a well-known piece played by a set of actors to whom it is new with the effect produced by its original interpreters. The success of the comedy was nevertheless very marked, though—as it is now no longer a question of its literary merit—it may be said that the success was attained somewhat unexpectedly by M^{lle}. Emilie Broisat, who is herself, like the piece, a *débutante* at the Français. She came to the Français from the Odéon. Her part—that of Marcelle—is the only one that is really sympathetic. It was represented with feeling and art. But the reason for the production of the *Demi-Monde* at the Français at this particular moment was that M^{lle}. Croizette—the *bizarre* and notorious heroine of the *Sphinx*—might have a good part. She has but partially succeeded. She has not done more than efface the souvenir of Pasca at the Gymnase: perhaps she has not done that with everybody, and certainly she has not effaced the memory of Rose Chéri—the first exponent of the character. In reality, says one of the soundest of her critics, "La baronne d'Ange est une princesse, née dans une loge de portier. Elle doit avoir assez de distinction naturelle pour justifier ses aspirations, pour excuser l'homme qui veut lui donner son nom. Ce n'est pas que M^{lle}. Croizette soit commune; non, assurément. On n'est point vulgaire avec ce tempérament, avec cette beauté bizarre et attirante. Mais c'est la beauté d'une bohémienne, qui séduit plus par son étrangeté que par son élégance. Il y a dans la voix et dans les allures quelque chose de prime-sautier et de sauvage. Ajouterai-je que M^{lle}. Croizette n'est encore, sur bien des points, qu'une écolière; qu'elle cherche à couvrir l'imperfection

de l'ensemble par deux ou trois coups d'audace, comme a été celui de son empoisonnement dans le *Sphinx*; mais que ces excentricités, excusables dans un mélodrame romanesque, jurent avec le tissu ferme et serré du *Demi-Monde*." Delaunay and Got were successful, as might have been predicted. Mdlle. Tholer failed, as might also have been predicted. Mdlle. Natalie did not perhaps realise that "remnant of good breeding" which the piece requires of her. But on the whole the interpretation was satisfactory, and the permanent place of the *Demi-Monde* in the repertory of the theatre is assured. Shall we ever be permitted to see this work of art in London?

MUSIC.

DR. HANS VON BÜLOW'S RECITAL.

THE announcement that Dr. Hans von Bülow would give a recital at St. James's Hall last Saturday afternoon was sufficient to fill the great hall to the very doors. No doubt the name of the great pianist was sufficient attraction for a large number of those who came together; but even greater interest was roused by the very unusual character of the programme. A recital consisting exclusively of Beethoven's music is in itself no novelty. Mr. Charles Hallé has on more than one occasion given a series of performances at which nothing but this composer's pianoforte sonatas was brought forward; but a programme containing only three pieces, and yet occupying an hour and three-quarters, is perhaps unexampled. These three pieces were: (1) the "Sonate Pathétique;" (2) the grand Sonata in B flat, Op. 106; and (3) the "Thirty-three Variations on a Waltz by Diabelli," Op. 120. If a player of such unlimited resources as Dr. Bülow, to whom every class of music seems equally familiar, can be said to have a speciality, it is probably his rendering of Beethoven's later pianoforte works; and it was doubtless the announcement that the two greatest, most elaborate, most difficult (and consequently most seldom heard) of these would both be included in the programme, which brought together such an assemblage of musicians as is only to be seen on occasions of exceptional artistic interest.

It is needless to dwell on a work so well known as the "Pathétique," further than to say that it was probably brought forward to enable the hearers to compare its composer's starting-point with the ultimate goal which he attained. The difference between the Beethoven of 1799 (the date of the publication of this sonata), and the Beethoven of 1818 (Op. 106), or 1823 (Op. 120), is indeed wonderful. No parallel instance of development of genius is to be found in music. In Handel's earliest extant works—those composed at Hamburg in 1704 and at Rome in 1707—the style of the *Messiah* and *Samson* is completely foreshadowed. So, too, to a greater or less extent with other composers, such as Bach, Mozart, or Mendelssohn. But the compositions of Beethoven's youth give not even a glimpse of what Von Lenz calls the "apocalyptic abysses" of his later works, such as the sublime *adagio* of the B flat sonata, or the "sacerdotal solemnity" or "oracular mystery" (to quote Dr. Bülow himself), of such variations as Nos. 14 and 20, of the "Thirty-Three." It is virtually a new Beethoven that we meet with here. He opens in these colossal creations a hitherto untrodden path in music; in them he carries the art to the furthest development as yet attained. On this road others, such as Schumann and Brahms, have followed him, but no one has yet passed him. There can be no finality in art: and therefore it is impossible to say that hereafter he may not be surpassed, even as he surpassed Mozart; but at present at least there are no indications of such an advance, and his later sonatas, &c., are (from an artistic and aesthetic, though not from a merely technical point of view) the "ultima Thule" of pianoforte music.

Of all the later sonatas, that in B flat is the largest in extent and the grandest in its contents. Von Lenz calls it "a pianoforte Chimborazo, with all other existing sonatas as its terraces—the apotheosis of the piano as a solo instrument." It towers above other sonatas just as the Choral Symphony surpasses all other symphonies. The difficulties it presents to the pianist are such that none but a virtuoso of the first rank can touch it. Beethoven himself said to his publisher, Arturia, concerning it, "There you have a sonata which will create pianists, and which in fifty years' time will be played." At the time of its appearance no one, not even Ries, Beethoven's favourite pupil, would venture to produce it in public. The credit of its first performance in Germany is due to Mortier de Fontaine; in this country it was first played by Mdme. Arabella Goddard. Mr. Hallé has also several times performed it at his Beethoven recitals; and Dr. Bülow introduced it at St. James's Hall last season. Like all highly emotional artists, Dr. Bülow is an unequal player; and it was therefore just an open question whether he would happen to be "in his best form" on Saturday. All doubts on this point were very soon dispelled. Never, it may safely be said, has he played more superbly than on this occasion. The symphonic dignity of the first *allegro*, the fairy playfulness of the scherzo, the deep pathos of the *adagio*, and the contrapuntal elaborations of the final fugue received from his hands such an interpretation as will not soon be forgotten by those who were present. Even more marvellous, if possible, was the great pianist's performance of the "Thirty-three Variations," a work which we believe he was the first ever to play in public. The history of these Variations is very curious. Diabelli, the music publisher, conceived the idea of getting fifty different composers to write one variation each on a waltz of his composition, and of publishing the collection under the title of "Vaterländischer Künstlerverein." Among those to whom he applied was Beethoven, who, instead of one variation, sent him thirty-three! Any analysis or description of this prodigious work is impossible in our present limits: to those who desire to gain a thorough insight into its meaning, we recommend the study of Dr. Bülow's masterly annotations, in his edition of Beethoven, published by Cotta, of Stuttgart. It may be mentioned in passing, for the sake of those who may be unacquainted with the fact, that Dr. Bülow is, if possible, even greater as a critic and editor than as a pianist; and the edition just spoken of is one of those monumental works without a knowledge of which a player's education can hardly be considered complete. The performance of the Variations was, as already remarked, truly marvellous. Not only was the technical accuracy unimpeachable, but the "reading," the intelligence, and the feeling pervading the whole were simply perfect. It was not Bülow: it was Beethoven himself. It is to be hoped that the good Doctor will repeat the Variations at one of the Monday Popular Concerts, for the sake of the large number of amateurs who were unable to hear him on Saturday.

It only remains to add that the whole programme was played, according to Dr. Bülow's custom, from memory. The second recital takes place this afternoon. EBENEZER PROUT.

THE first meeting of the Musical Association was held on Monday, November 2, at the Beethoven rooms. There was a large attendance of members. After the preliminary business meeting (Mr. Hullah in the chair), the reading of papers began at 5 P.M. (Mr. George Macfarren in the chair). Dr. W. H. Stone read a paper, "On Extending the Compass and Increasing the Tone of Stringed Instruments." After a few remarks on the importance of the formation of the Association, as a step to a closer alliance between the scientific and technical departments of Music, Dr. Stone said that he claimed to have already succeeded in

effecting an extension of compass in the bass of wind instruments, which had come into general use; and he had for some time been endeavouring to effect a similar extension in the case of strings. The difficulty with the strings was, that they must not be thickened or lengthened; the thickening introduced transverse (torsion) vibrations, which cause inharmonious tones; and the lengthening rendered performance difficult. The method employed was to increase the specific gravity of the strings by making them of gut wound with heavy copper wire. The desirability of the extension of compass is attested by the use made of notes down to CCC, and even lower, by Beethoven, Mendelssohn, Onslow, Gounod, &c. A movement of a quintett of Onslow's was performed, in which the double bass is written, and was played, down to CCC. Improvements have also been effected in the box of stringed instruments by Dr. Stone and Mr. Meeson; these are registered. Light bars of wood are so placed as to afford support to the frame with little additional material. They will make a bad fiddle into a good one, and enable the double bass to support the resonance of the new deep notes. The opinion was generally expressed that the communication offered an important means of avoiding certain mutilations in the performance of the works of the great masters.

Mr. R. H. M. Bosanquet then read a paper on "Temperament, or the Division of the Octave." The most important subjects of the theory were "regular systems," in which the notes form a uniform series of fifths, and "regular cyclical systems," in which the octave was divided into equal intervals. The position of Helmholtz was brought forward, that in systems of approximately perfect fifths a separate notation is required to indicate position with reference to the circle of fifths; the defect of Helmholtz's own notation was pointed out (it is not suitable for written music); and a notation founded on similar principles, but capable of use in written music, was explained. A sheet of music in which the notation was used was handed round, and the use of the notation was further shown by the discussion, with its assistance, of a scale for the key of F given by Mersenne, and of the enharmonic organ of Gen. Thompson. The principle of "symmetrical arrangement" was illustrated by a diagram of the notes in the last-mentioned instrument. If equal temperament notes are arranged in order of the scale in a horizontal line, and the "intervals of departure" from equal temperament positions set off at right angles, sharp departures upwards and flat downwards, we shall have a *symmetrical arrangement*. This is the principle of a key-board which has been constructed, in which the forms of execution of passages are the same in all keys. The paper concluded with certain theories on the regular cyclical systems formed by dividing the octave into any number of equal intervals.

In speaking of last Saturday's concert at the Crystal Palace, the place of honour should be given to a new member of the renowned orchestra, Mr. Clinton, who made his first appearance as a soloist on that occasion, in Weber's Second Concerto for the Clarinet. This instrument was a special favourite with the composer of *Der Freischütz*, who enriched its *répertoire* with no fewer than six important works. Of these the best known, as well as the finest, is the Sonata for Piano and Clarinet, which has been frequently heard at the Monday Popular Concerts. The concerto played on Saturday, which is in the key of E flat, is distinguished by Weber's romantic flow of melody; and the peculiarities of the solo instrument are treated with an intimate knowledge of their effects. Mr. Clinton had no easy task in coming forward as the successor to so distinguished a performer and so genuine an artist as the late Mr. Papé; and it is no more than justice to him to say that his first appearance was a complete success. His tone is not only of very fine quality, but remark-

ably pure and even; and his facile and perfect execution of the most difficult passages showed him to be a virtuoso of the first rank. It cannot be said at present that in breadth of style and depth of expression he equals his predecessor; but he is still a young man, and evidently an intelligent one. We understand, too, that until he joined the Crystal Palace band he had had but little experience in classical music; and there is therefore every reason to believe that constant playing in association with such first-class artists as the members of that orchestra will soon supply what little is still lacking for an artistically perfect performance. Mr. Manns may be congratulated on a valuable addition to the ranks of his instrumentalists. The most interesting novelty of the concert was Brahms's arrangement for orchestra of three of his "Hungarian Dances." These works were originally written as pianoforte duets, and are also familiar to musicians in the arrangement by Herr Joachim for piano and violin. The composer's orchestration of these dances is, as might be expected by those familiar with his scores, most ingenious and interesting. Especially effective is the use of the wind instruments in the second number, with a delicious oboe solo, exquisitely played by M. Dubrucq. The third of the dances is, in its new dress, inferior to the other two; but all three are very pleasing, and will doubtless be heard again. The symphony was the first (in the English edition) of the "Twelve Grand," which Haydn wrote for Salomon during his visits to England in 1791, 1792, and 1794, and which are usually known as the "Salomon Set." Though not one of the finest, it is very melodious and pleasing, and fully deserved reviving on this occasion. The overtures were Rossini's *Siege of Corinth*, and Mendelssohn's *Midsummer Night's Dream*. The vocal music was contributed by Mme. Sinico and Mr. Edward Lloyd. This afternoon Mendelssohn's 95th Psalm, a work too seldom performed, will be produced for the first time at these concerts.

THE Royal Albert Hall Concerts, the prospectus of which was recently noticed in these columns, commence this evening. There will certainly be no lack this winter of good music in the metropolis. It is only to be wished that the Albert Hall could be transported bodily into some more convenient locality than South Kensington. The difficulty of getting home at night will, it is to be feared, deter many who would otherwise be glad to avail themselves of the opportunity of hearing so much new music as appears likely to be brought forward at these concerts.

THE *Débats* of the 1st inst. contains a long article from the pen of M. Rey, on the newest prize-composition at the Académie des Beaux-Arts. It is a "scène lyrique" entitled *Acis et Galatée*, composed by M. Léon Ehrhart, a young man hardly twenty years of age, who is a pupil of M. Henri Reber. M. Rey speaks of the music as showing considerable promise.

THE celebrated violinist F. Laub is lying seriously ill at Carlsbad with an affection of the lungs.

M. DAVIDOFF, the great Russian violoncellist, has resigned his post in the orchestra of the Royal Theatre in St. Petersburg, to become director of a Russian railway company. He still retains his engagement as professor in the Conservatorium.

THE death is announced at Mainz, on October 26, of Peter Cornelius, a composer of vocal music who enjoyed a great reputation in Germany; and who, besides being a distinguished musician, was also a highly educated man, being acquainted with no fewer than seven languages.

KIEL's new oratorio *Christus* is to be performed by the Riedel'sche Verein in the Thomaskirche, Leipzig, on the 20th inst.

THE *Roma* announces that a Neapolitan has invented a new instrument, which he calls the

Pianografo. It is so arranged that, as the player strikes the keys, the notes inscribe themselves upon a piece of paper—an invaluable invention for the composer, who has no longer to depend on his memory to record his compositions. The Institute of Arts at Milan, having appointed a commission to examine and try the instrument, have conferred a medal upon the author.

THE Cologne papers write in glowing terms of the unprecedented success of August Wilhelmj's performances at the first of the Gürzenich Concerts at Cologne, which are under the direction of Dr. Ferdinand Hiller. Victor August Wilhelmj, who was born in 1845 at Usingen, in the old Duchy of Nassau, where his father held an influential post in the local law courts, received his education at Wiesbaden. His extraordinary musical talent was first recognised by Liszt, through whose personal intercession the elder Wilhelmj was induced to give his consent to his son's adoption of music as a profession, and through him also Ferdinand David of Leipzig was persuaded to receive August Wilhelmj into his house, and also to undertake the charge of his musical training. In 1865 the young violinist made his *début* in Holland, and from that time his career has been one uninterrupted course of brilliant successes. According to the testimony of old musical critics, no one has ever yet produced such magical effects with bow and strings as Wilhelmj, whose lithe and slender fingers seem to be endowed with an independent vitality, and whose mastery over the technique of his art is as perfect as his musical genius is exceptional.

POSTSCRIPT.

A GREEK inscription has recently been discovered on the buried side of one of the flags used in the flooring of the Sakhra at Jerusalem. Copies of it have been sent to the office of the Palestine Exploration Fund, both by M. Clermont-Ganneau and by Lieutenant Conder. The following is the text, with the short commentary furnished by M. Ganneau:—

ΚΟΜΕΡΚΙΑΡΙΟΣ ΑΝΕΥΙΟΣΑΡΕΟΒΙ . .
 ΟΝΥΣ . . . ΟΝ ΕΝΘΑ ΚΑΤΑ ΚΙΤΕ . . ΟΑ . .
 . . ΣΚΟΝΕΥΕΤΕ ΤΗΕΡΑΤΟΥ Α
 Η
 ΠΟ ΤΗΣ ΟΣΙΑΣ ΜΝΗΜΗΣ ΜΑΚΕΜΒ . .
 + ΙΝΑ Α ΕΤΟΥΣ ΡΔ +
 +

"Comerciarius, cousin of Arcob (indos?) . . of the . . lies here, the . . Pray for him . . of holy memory . . in the month of December . . + Indiction I, year 104. +

"About half of the inscription, that on the left, appears to be wanting. Comerciarius is put for *καμ-μερκάριος*, an official title under the Byzantine Empire; the proper name Arcobindos is nearly certain, and is that of a historic family which played an important part under Anastasius and Justinian: several persons of this name were invested with important functions, and that of our inscription would be one of them, since it was thought proper to mention his relationship with the object of the inscription."

It seems that the letters which precede *ἐνθα κατὰ* (for *κατὰ*) belong to the genitive plural in -ων, pointing out, perhaps, the titles of Arcobindos: the same observation applies to the first word of the third line, perhaps *ὁ ἀπὸ* . . . The imperative *ἐκτε* shows the carver's imperfect knowledge of Greek.

The day of the month of December was probably indicated. The grave question is that of the date: according to what era is the year 104 calculated? If, as one is tempted at first to believe, it is the era of Diocletian and the martyrs, this date would correspond to the year of our Lord 388, according to the *Art de Vérifier les Dates*. The number of the indiction agrees perfectly in this case. Nevertheless, the debased forms of the orthography and the appearance of the characters would lead us to admit an epoch

somewhat earlier; but we know how little these orthographic and palaeographic rules are applicable in Palestine. If this date be exact, we are brought to the time of Theodosius.

M. Ganneau thinks he has possibly obtained some clue to the mysterious *Ἀλκιος* of the Gezer inscription. He writes:—

"*A propos* of the Alkios of the bilingual texts of Gezer, I have lit upon a curious coincidence. Some years ago a sarcophagus was discovered at Lydda with a Greek inscription, of which Major Wilson gives a part only. I myself found the commencement about four years since. It mentions a certain *Pyrrhoun*, surnamed Malthakes, grandson of *Alkios*, son of Simon, (son of) Gobar. The two names of Alkios being identical, perhaps they are those of the same personage! In fact, between the date of the sarcophagus, which probably belongs to the Herodian period, and that of *Alkios*, there are two generations, which brings us to the time of the Maccabees, at which I place the Gezer inscription. In this case, our Alkios, son of Simon, Governor (?) of Gezer, would have this *Pyrrhoun*, who was buried at Lydda, for his grandson.

"If the tomb which I opened on my last excursion is a family sepulchre, which everything leads me to believe it to be, it would result that our Alkios of Gezer was a native of Lydda. We may remark the resemblance between the Greek *Ἀλκιος* and the Hebrew *Hilkiah*."

In the same letter M. Ganneau informs the committee that he has found no fewer than twenty inscriptions, all hitherto unpublished, at Gaza. They are Christian, and not earlier than the sixth century. He says, however, that they will serve, among other things, to mark the special era of Gaza.

THE industry of forgeries is still being carried on with activity at Jerusalem. M. Ganneau speaks of a "grande plaque" of white marble which was brought to him, having engraved upon it "très soigneusement et très habilement," an enlarged reproduction of a shekel of the year 1!

SATURDAY, NOVEMBER 14, 1874.

No. 132, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Sir Robert Peel: An Historical Sketch. By Lord Dalling and Bulwer. (London: Bentley & Son, 1874.)

SIR ROBERT PEEL has almost passed into the twilight between living memory and history which is the darkest period for a statesman's fame, and a younger generation may thank both Lord Dalling and Mr. Greville for seeing with their eyes as it were, though in posthumous papers, glimpses of one who was for a quarter of a century the greatest member of the English Parliament, and one of the most eminent public men in Europe. He appears in Lord Dalling's portrait as the representative man of his age, the impersonation of a great political epoch; but as its minister, not as its moulder—as the exponent, not the inspirer of its spirit. If Prince Bismarck supplies an instance to those who contend that great men exercise an influence over the course of human affairs which baffles the attempt to construct a science of history, reducing its movements to general laws, Sir Robert Peel affords an example to those who believe in the complete subordination of individual agents, however remarkable, to social forces. In the literal, if not in the opprobrious sense of the word, Peel was a time-server. He watched the clock, and when it struck the hour he was the man, but not a moment sooner. His wary and almost stealthy movement in politics resembled his bodily movement on the floor of the House of Commons, as Lord Dalling describes it—"like that of a cat, but of a cat well acquainted with the ground it was moving over; the step showed no doubt or apprehension, it could hardly be called stealthy, but it glided on firmly and cautiously, without haste, or swagger, or unevenness." To some of his early adherents his whole political life appeared one long course of hypocrisy and treachery, of the concealment of his real opinions until it served his ambition to avow them, and of sudden changes in policy which were deliberate betrayals of his supporters. A cumulative indictment is brought against him that from the first to the last act of his public life he was acting a part, the part of a traitor. In 1810 he professed an opinion in favour of the existing currency laws, in 1819 he carried the Act which restored cash payments; he supported the Test and Corporation Acts one year, and repealed them the next; the trusted leader of the Protestant party, he carried Catholic emancipation; the champion of protection to agriculture, he suddenly outbid his Whig rivals, and established free trade in corn. His conduct in relation to the income-tax is generally left out of the

indictment, but here, too, we find the same contradictions. In 1830 he treated Mr. Huskisson's suggestion of such a tax as not to be listened to; in 1833 he commended Lord Althorp for not resorting to it; in 1835 he spoke of it as a "scourge," and warned the agricultural interest against it; in 1840 he supported Mr. Baring's attempt to supply the deficiency in the revenue by indirect instead of direct taxation; in 1842 he himself suddenly brought in an income tax, but as a temporary expedient to be limited to three years; in 1845 he renewed it for three years more, with an intimation that it might be expedient at the end of that period to continue it.

The cumulative charge of political treachery thus looks at first sight exceedingly strong, yet it will not bear investigation in detail. The cases of which it is made up should be weighed rather than counted. As for his early change on the currency laws, it is unreasonable to suppose that in 1810, when he was but twenty-two, he could have mastered the question, or to censure him for displaying an advance in economic science in 1819. Roman Catholic emancipation he accepted as the less of two evils, and he did so at the cost of much certain obloquy and enmity, and of his much-prized seat for Oxford. Even his accusers admit that in 1829 he could no longer resist emancipation, but they urge that he had for several years concealed a conviction that it was irresistible. The truth seems to be that he never really abandoned his objections to the measure, but they were in the end outweighed by other considerations, and he carried the Emancipation Act reluctantly as the alternative to civil war, and as a remote and contingent danger to be preferred to a certain and immediate calamity. We are inclined to think that Lord Dalling pays an unmerited compliment to his oratory at the expense of his candour, when he calls it "a consummate touch of art on the part of the orator" for Peel to have said in reply to Sir Charles Wetherell: "The credit of settling the question belongs to others, not to me. It belongs, in spite of my opposition, to Mr. Fox, to Mr. Grattan, to Mr. Plunkett, to the gentlemen opposite, and to an illustrious and right honourable friend of mine (Mr. Canning) who is now no more." On the Reform question, again, Peel had an opportunity of snatching the solution from the hands of his political rivals, but he neglected it, and opposed the measure to the last.

The cumulative case thus breaks down, but it does not follow that every part of it does. Count Cavour predicted years before the abolition of the corn laws that Peel would achieve it. On what did he found the prediction? Was it because, as an Italian politician, he thought the end justified the means, and expected dissimulation from a statesman? Was it because he saw through Peel, and saw that he was acting a part? Or was it simply because he himself saw the way to free trade on the part of England, and was convinced that Peel too must see it at last? Was it that he had watched the working of Peel's mind, and found that it was slow but sure, not embracing at once a new policy in its

entirety, but surveying it cautiously on all sides, and at length taking it all in? It must be remembered that Peel never disputed the policy of free trade as a general principle, and that he only resisted its application to the British corn trade on the ground of established and vested interests, and particular circumstances. The Irish famine overcame all such special considerations, and it may be that Peel was less far-seeing than Cavour, and had not contemplated, down to the famine, the opening of the ports in his own day. It is sometimes urged against him that he went beyond the exigency of the famine, and abolished the corn duty when he need only have suspended it. The error he really committed at the last was an opposite one: he left a permanent shilling duty on foreign corn, thereby raising the cost of all home-grown corn to consumers for an infinitesimal gain to the coffers of the State; thus showing that even in 1846 he had not fully mastered the principles of free trade.

The success of free trade has, in fact, been far greater than even its advocates foresaw, and there really did appear reasons beforehand to apprehend that it would temporarily injure the British farmer, and permanently lower the value of land. There were therefore some plausible practical objections to it, and Peel's mind, cast in a Conservative mould, and cautious to excess, was one especially liable to what Archbishop Whately has called the fallacy of objections, which consists in inferring that because there are some objections to a measure they ought to prevail, without considering whether they are not overbalanced by considerations on the other side. It should not be forgotten, too, that Peel had imbibed from the writings of Ricardo the pernicious doctrine that taxes on food cannot fall on the labouring classes, and that but for this dogma the corn laws would never have been passed, as Cobden himself emphatically admitted.

Peel seems, in short, to have been the representative of his age in its processes as well as in its results, its struggles as well as its achievements, its opposition to reforms as well as its accomplishment of them. He represented a period during which, on the one hand, the principle of religious freedom and civil equality gained the ascendant, but not without an arduous contest, and in the midst of prejudices and fears; and during which, on the other hand, the principle of commercial liberty likewise forced its way to acceptance against fierce opposition. Peel represented in both cases the opposing forces as well as those which were finally victorious. In the depths of his own wary and balancing mind, probably the same battle between opposite views took place that was waged between contending parties in Parliament and in the country. His was not an original, a creative, or a far-seeing intellect; he took his impressions from his epoch in place of stamping his own image upon it. It involves a contradiction to bring, as his traducers have done, the double charge against him of lack of prescience, and of deliberate treachery, but his political morality can only be cleared of dishonour at some cost to his intellectual reputation. It must be added too, that if he did not lower the standard of

political morality, he certainly did not raise it; though in this respect he acted only, not only as his rivals, but also as his successors have done. And if he did not act a false part throughout his political life, it would seem that his own greatness was, though perhaps unconsciously, generally its dominant object.

The ability and skill displayed by Peel in financial administration between 1842 and 1846 are beyond question, but there is one of his measures during that period which has lost the magnitude which it once assumed. The storms which raged round his Bank Charter Act of 1844 are laid; few or none now see in it either all the good or all the evil for which it was then enthusiastically applauded on one side, and furiously opposed on another. It has not done, and could not do all the good that was expected of it; it has not prevented over-speculation, inflations and collapses of credit, great fluctuations of prices, and disastrous commercial crises: no mode of regulating the issue of bank notes could achieve such results, and the arguments of the advocates of the Bank Charter Act only show that they, including Sir Robert Peel himself, had not mastered the first principles of currency. This boasted measure could neither prevent nor arrest drains of bullion, and quite a different mode of dealing with them has been resorted to by the Bank. On the other hand, the Act has not done the mischief which its opponents predicted: it has placed the principle of convertibility beyond dispute; and the acrimony with which it was once assailed almost passes the comprehension of the economists of the present day, although they are by no means remarkable for tolerance. In short, the importance of the Act was immensely overrated. Lord Dalling has not been happy in his comments on Peel's earlier Currency Act of 1819. Speaking of the inconvertible currency which preceded that measure, he says the value of the note depended on the credit of the bank, and "it was utterly impossible that a bank note not immediately convertible into gold could have precisely the same value as gold . . . nor is there any possibility of keeping paper money on an equality with metallic money, except by making the one exchangeable for the other." Had Lord Dalling studied Mr. Mill's exposition of the subject he would have known that the value of an inconvertible currency depends on its quantity not on its quality, and that it might be made, by attention to the price of bullion, and regulating the issues accordingly, to conform exactly in all its variations to those of a convertible one.

Lord Dalling's sketch hardly does justice to Sir Robert Peel's administration in the Home Office in 1825 and 1826, or to the reforms of the criminal law which he then introduced. They were not only important reforms in criminal law, but also important consolidations of the law tending to future consolidations; and they are treated accordingly by Bentham's interpreter, Dumont, as steps towards codification. Peel reduced to a single statute all the Acts relating to bankruptcy, he consolidated the laws relating to theft, and threw the jury laws into the form of a code. Had he lived to our

time, he would in all probability have made the consolidation of the law one of his principal objects. It is one of the cardinal defects in the statesmanship of his great successor, Mr. Gladstone, that he has never displayed the interest in the reform of our jurisprudence with which Peel's example might have inspired him. Lord Dalling's sketch is remarkably deficient in anecdote, though Lord Brougham's *Lives of Statesmen* had proved that sketches of equal brevity need not be devoid of interest and illustration of that kind. The contemporaneous publication of the Greville Memoirs, however, makes this defect of less importance, and the two works together go far to enable the present generation to reproduce before its mind the image of a statesman who in his faults and infirmities, as well as in his virtues and great qualities, was the representative of his age and country.

T. E. CLIFFE LESLIE.

BRUGSCH-BEY ON THE EXODUS.

La Sortie des Hébreux d'Égypte et les Monuments Égyptiens. Conférence par Henry Brugsch-Bey. (Alexandrie: A. Mourès, 1874.)

THE lecture upon the Exodus which Brugsch-Bey lately delivered in this country has not been published, nor has any sufficiently complete report of it appeared. It is no doubt destined to form a portion of an important work just advertised under the title of *Bibel und Denkmäler*, consisting of a series of critical enquiries, the results of which, we are told, will show to how great an extent the biblical traditions are confirmed, completed, and illustrated by means of the existing monuments of ancient Egypt. Our curiosity may in the meanwhile be somewhat allayed through the study of the lecture which was delivered in Egypt, and has been published in Alexandria. The two lectures are essentially identical, although the author's views appear to have undergone a change on some minor details since the first was published, and the second contained a number of most interesting details which are not mentioned in the first.

It would be a serious error to suppose that those results which have excited so much interest in biblical students, have been arrived at through direct speculation on the Exodus of the Israelites. All who are acquainted with the author's writings can clearly see how these results have been forced upon him as necessary conclusions from the mass of evidence which has for many years been accumulating under his hands. Already in the year 1857 Dr. Brugsch published a magnificent work on the Geography of Egypt, in which all the data furnished by the monuments then known were carefully compared with corresponding data in the Bible and in Greek, Latin, Coptic, and Arabic authorities. The discoveries which have been made since 1857 have very considerably enlarged, and in not a few instances corrected, his views. The amount of documentary evidence which he has now in his possession for the reconstruction of the map of ancient Egypt is truly prodigious. Until this evidence is fully laid before them, scientific enquirers are bound

to reserve their judgment; and they cannot but be aware that the evidence hitherto depended upon in reference to the movements of the Israelites in Egypt is of the most unsatisfactory character. Timid minds have no reason for fearing that their faith should be undermined by daring novelties. Far from contradicting the biblical narrative, Brugsch-Bey follows it minutely. His topography is in perfect harmony with it. The most startling part of his system is the denial of the passage through what we now call the Red Sea. But it is only in our translations that the sea through which the Israelites passed is called Red.

"The determination of the route by which the Israelites left Egypt," says the writer of an article in Dr. Smith's *Dictionary of the Bible*, "is one of the most difficult questions in biblical geography. The following points must be settled, exactly or approximately:—The situation of the Land of Goshen; the length of each day's march; the position of the first station (Rameses); and the direction of the journey."

"The Israelites, setting out from a town of Goshen," the learned writer continues, "made two days' journey towards the Red Sea, and then entered the wilderness, a day's journey or less from the sea. They could only, therefore, have gone by the valley now called the *Wadi-t-Tumeylât*, for every other cultivated or cultivable tract is too far from the Red Sea. Rameses . . . must have lain in this valley."

Since this article was written much new light has certainly been thrown upon the subject. The Egyptian station called Rameses has long been known to us through the papyri. In one of these documents a scribe says that he has obeyed the commands of his lord, and given corn to the soldiers as well as to the Hebrews [so Dr. Brugsch translates *Apurîu* in his first lecture] who are bringing stone to the fortress of the city of Rameses. In another papyrus Rameses is said to be between Egypt and *T'aha*, the south of Palestine. It is also described as a seaport, or at least as communicating with the sea. In a third papyrus Rameses is said to be in the land of *T'al*, which is known from the historical inscriptions to be on the high road between Egypt and Palestine. And quite recently the actual site of Rameses has been identified beyond a doubt. It was identical with Tanis, the modern Sān, known in the Bible under the name of Zoan. "Marvellous things," says the Psalmist, "did He in the sight of their fathers, in the land of Egypt, in the field of Zoan." It is a very curious fact that one of the inscriptions which enabled Dr. Brugsch to identify Tanis with

Rameses used the expression,  *seḫet T'ānet*, exactly corresponding to the Hebrew *שֶׁחֶת אֲנֶת*.

This identification of the first station of the Israelites is of extreme importance. Rameses was situated on the Tanitic branch of the Nile; it was the first station of the high road to Palestine; and it was the chief town of the district called the Tanitic nome. The eastern boundaries of this nome touch a district which on the hieroglyphic lists is called *Tuku* or *Tukut*, with a chief town bearing the name of Pithom. The first Egyptian letter (≡) in the proper name *Tukut* is one which, as Dr. Brugsch has satisfactorily shown, corresponds to a Semi-

tic *s*. Tukut is therefore easily identified with Succoth, the second station of the Israelites. Pithom is one of the cities which are said in the Book of Exodus to have been built by the Israelites. There is a letter in the sixth Anastasi papyrus in which the scribe tells his master:—

"We have given free passage to the Shasu [Bedouins] of the land of Atuma [Edom] at the fortress of King Menephthah, which is in the district of Succoth, near the lakes of the city Pithom of King Menephthah, which is also in Succoth, in order that life may be given to their cattle on the great domain of the king."

These wandering Arabs had in a time of famine come into Egypt like the family of Jacob, and like them were received with royal hospitality.

Having found Rameses, Pithom, and Succoth, Brugsch-Bey proceeds to identify Goshen, or, as it is called in the Septuagint, Γέσην Ἀραβίας (Gen. xlv. 10). The district called by the Greeks the Arabian nome was adjacent to the two which have just been mentioned, and the chief town of it on the Egyptian lists is called *Kesemet*. The Egyptian language being without medial letters, *Kesemet* is as close a transcription as can be desired of the Greek Γέσημ. The final *et* is the usual feminine termination. The site of Goshen corresponds to the locality called Facus on modern maps. There is, it appears, an overwhelming amount of evidence to show that the three districts which have been mentioned contained a large Semitic population; in fact,—

"on the ancient map of Egypt, the greater part of the names of the towns, villages, fortresses, canals, and lakes on the territory of the three districts of Pithom, Rameses, and Goshen are not taken from the Egyptian language, but are to be explained solely by the aid of Semitic idioms."

Purely Egyptian documents, then, enable us to determine the positions of the first two stations of the Israelites, and the direction of their journey. A letter in the fifth Anastasi papyrus adds still further light to the subject. The writer of the letter had pursued two servants of his master who had fled from the town of Rameses. He left this place on the ninth day of the month Epiphi, and he reached Succoth on the tenth. On arriving at the fort (*chetem*) he was told that the fugitives had passed by the "Wall" north of the Migdol of King Seti Menephthah. Both the "Wall" and the Migdol are well known from other documents. They were on the high road to Palestine, and there is no reason for doubting that Migdol (the Magdolos or Magdolon of the Greeks) is the Migdol of the Exodus. The children of Israel were told to "turn and encamp before Pihiroth, between Migdol and the sea, over against Baal-Zephon." That the sea here mentioned should be the Arabian Gulf, as has hitherto been supposed, really appears incredible. Up to this time the route of the Israelites lay along the coast of the Mediterranean. Migdol is near the Mediterranean, and very far from Suez. Baal-Zephon* is

one of those Semitic names which belong to localities of quite a different region from those on the Egyptian shores of the Arabian Gulf. Brugsch-Bey believes that he has discovered the Egyptian name of which Pihiroth is the Hebrew transcription, and that it signifies the same thing as the βάρθρα of the Lake Serbonis. It is, as Milton says after Diodorus, in

"that Serbonian bog
Betwixt Damietta and Mount Casius old,
Where armies whole have sunk,"

that he places the disaster of Pharaoh's host. The wilderness of Shur, into which the Israelites passed, was, he thinks, the desert between the Mediterranean and the Gulf of Suez, and the bitter waters which they arrived at are the well-known "Bitter Lakes."

We must wait patiently for the scientific demonstration of a certain number of facts which are not yet sufficiently familiar to Brugsch-Bey's colleagues in Egyptology, and about which he has no misgivings whatever. He speaks of his facts as being such "que personne ne pourrait nier à moins qu'il ne conteste que A soit A, et B soit B." This at least we may confidently affirm, that some of the facts which have been established are of such first-rate importance as to give the new system a degree of probability which is not likely to be shaken, even if the evidence on some minor points should turn out upon examination to be less cogent than the author supposes.

On the subject of the Red Sea our author merely says that the Elohist texts of Scripture which have reference to the Exodus never speak except of "the sea," or of "the Egyptian sea." May it not, however, be fairly asked whether the "Sea of flags or weeds," which is commonly understood to stand for the Red Sea in Scripture, is not more likely to have originally been the name of a marshy piece of water like the Lake Serbonis, than of a sea which appears to be as singularly free from flags or weeds as the Red Sea? Naturalists have, no doubt, discovered different kinds of seaweed in the Arabian Gulf, but the evidence relied upon as to the quantity of it appears to be wholly apocryphal, and in fact suggested by the name "sea of weeds." Bruce says that he never saw any sort of weed in the Red Sea, and this led him to conjecture that the "sea of weeds" derived its name from the trees of white (*not* red) coral which are spread over its bottom. It appears more probable that the name was derived from a sea full of real weeds, and was in later times applied to the Egyptian waters generally. On looking more carefully into the matter, it will, I believe, be found that *suf* is not really Hebrew, but a form of the Egyptian word *thufi*, which in the papyri has undoubtedly the sense of a marsh plant.

P. LE P. RENOUF.

If the size of Encyclopaedias may be regarded as an index of the extent of a nation's learning, the Chinese are certainly far in advance of the rest of the world in that respect, for we are informed that a Cyclopaedia of Ancient and Modern Literature has just appeared at Peking which consists of 6,104 volumes, and costs 4,000*l*.

SIR JOHN SUCKLING.

The Poems, Plays, and other Remains of Sir John Suckling. A New Edition. In Two Volumes. (London: F. & W. Kerslake, 1874.)

MR. W. C. HAZLITT in a brief preface to this collection has called Suckling "a man of no ordinary genius, considering the early age at which he passed away, and what he has left behind him in print, not to name his political exploits"—which it would indeed be hard to name, since his one great political venture had never any chance of success, and brought upon him irretrievable ruin. A life, written by the Rev. A. Suckling in 1836, has been reprinted and "carefully revised," an assertion that does not apply to the text of the author. Wrong pointing makes nonsense of Moseley's Preface, and wrong printing—not to mention the omission of two stanzas—does the same for the Journey to France. That poem, a note tells us, is not found in the editions, but is printed here from a Harleian MS., on the authority of a note by Sir H. Ellis attributing it to Suckling. Mr. Hazlitt does not mention that it is generally known as Corbet's, was published in his collected poems (1647), but is ascribed to Sir John Mennis by the editor of *Musarum Deliciae*.

John Suckling was of a Norfolk family. He was born in his father's house at Whitton, in the parish of Twickenham.

"By both parents his descent was respectable: his mother was sister to Sir Lionel Cranfield, afterwards Earl of Middlesex and Lord Treasurer; and his father, who had been returned in 1601 as member for the borough of Dunwich, was subsequently made Principal Secretary of State and Comptroller of the Household to King James I."

situations which he retained under Charles I., who made him a privy councillor.

The poet is said to have been at Westminster School, and he matriculated in 1623 at Trinity College, Cambridge. His father died, March 27, 1627, rich, and leaving (beside other charities) a bequest for an annual sermon in St. Andrew's Church, Norwich, his burial-place, "in commemoration of God's mercies and favours towards him." The next year, Suckling began his travels. To this date Sir Walter Scott assigns the letter to the House of Commons which Rushworth (i. 449) calls the "speech without doors." Scott is doubtless wrong in attributing the pamphlet to a lad of nineteen, and it is not found among the prose fragments here collected. Suckling took service with the English contingent of 6,000 sent to assist Gustavus, and he was present at the battle of Leipsic, and at several sieges. In 1632 he returned to England, and "spent his time in the usual diversions of the Court"—givingsplendid entertainments, and gaming deeply. His sisters came one day to the Piccadilly bowling-green "crying for the fear that he should lose all their portions." He is said to have often spent the greater part of the day in bed, practising combinations of cards. His reputation for courage was clouded by his receiving a cudgelling from the champion of a lady in whom he claimed an interest by a promise she repudiated.

Suckling lived in London till, in April,

* Baal-Zipuna occurs in the fourth Sallier papyrus (verso 1, line 6) as the name of a god, but accompanied by the determinative of foreign names. It manifestly points to the Syrian frontier, and I understand that Brugsch-Bey has discovered that a sanctuary of this god existed on Mount Casius.

1635, an information was filed against him for not residing on his estate, in obedience to the King's proclamation. He complied, and in his retirement wrote the *Session of the Poets* and the *Account of Religion*. The latter was a "discourse presented to the Earl of Dorset," setting forth the reasonableness of Christianity. Here and there we are reminded of the quaint turns of Sir Thomas Browne. The Incarnation is said to have been much nearer the natural way than the Creation, and therefore much easier, "woman being a more prepared matter than earth." But there is none of the imagination which fitfully but vividly irradiates the dusky labyrinth of the *Hydriotaphia*.

The drama was Suckling's next venture. He returned to London to superintend the performance of *Aglaura*, which was honoured with the presence of the King. The piece was written with two fifth acts, a happy and a woeful ending respectively. It was called a comedy or a tragedy according to which Act V. was used; and it had an equally valid claim to either title. Sainte-Beuve says of Patru, that a selection from his works would be a short one, for "posterity abridges, and will abridge more and more." Posterity has not reckoned Suckling's plays among its treasures. They have no interest of plot, nor development of character, nor characters to develop. Suckling admired Shakespeare enough to insert in these plays a random line of the master's here and there, but not enough to perceive his own utter deficiency of dramatic talent. There is a madness in his method, but it is not a fine frenzy. Incidents "tread upon each other's heel, so fast they follow," but they arise causeless, as in a feverish dream. The personages fret and fume in half-lines and dashes, and are perfectly tame all the while. They disguise themselves continually for no particular object. In the *Goblins*, remarks Hazlitt in his Lectures, "the whole business of the scene is taken up with the unaccountable seizure, and equally unaccountable escapes of a number of persons from a band of robbers in the shape of goblins, who turn out to be noblemen and gentlemen. It is a wretched list of exits and entrances." Perhaps Suckling's most dramatic passage is that in *Brenmoralt*, where the hero penetrates into Francelia's chamber, anticipating the well-known scene in *Robert le Diable*. He reproaches the lady with her coldness, receives the assurance of her esteem, and retires with the intention of deserving her, all with a frigid absurdity unsurpassable.

Of the blank verse of these plays this brief specimen (from the *Sad One*) may suffice:—

"*Francelia*. Think not, good sir, your elegant enforcements

Can seduce my weak innocence; it's a
Resolution grounded; and
Sooner shall the
Fixed orbs be lifted off their hinges,
Than I be mov'd to any act that bears
The name of foul. You know the way
you came, sir?

Clarimont. Is this all the respect the King shall have?

No, you would do well to clothe this
harsh denial
In better language."

Brenmoralt contained some satire—heavy and harmless—against the opponents of the

Court. Its author gave what proved to be no better support to the King's anti-Scotch policy. He equipped a troop of a hundred horse, so well armed that they were considered "the finest sight in the army," then marching northwards. But they were not warriors for the working day. Their flight from Newburn may have been no more disgraceful than that of the rest of the army, but the expectation raised by their gallant show made the disappointment more keenly felt. Everybody repeated the malicious lines by Sir John Mennis, beginning—

"Sir John got him on an ambling nag,
To Scotland for to ride-a," &c.

In the Long Parliament Suckling sat for Bramber. He addressed to Harry Jermyn a letter on the political situation. Therein he recommended to the King a cordial reconciliation with Parliament, and the dismissal of the unpopular Ministers. He next appears as a conspirator in Goring's hopeless undertaking to deliver Strafford from the Tower. Pym had been watching since March, 1641, and in May, at the critical moment when the Lords seemed inclined to start away from the bill of attainder, he stood up and denounced the plot. Suckling, with others implicated, fled to France, and lived in Paris so obscurely that the exact mode and time of his death are uncertain. It seems probable that he poisoned himself, and he was certainly dead before the end of 1642.

Suckling squandered his talent as he squandered his money. He has no place in the stately gallery of Clarendon's portraits, and only in a casual phrase of contempt does his name drop from Milton's pen. His fate was sad, but does not touch us like that of his brother Cavalier and poet, Lovelace. Both were brilliant, high-spirited, and unfortunate. Each is chiefly remembered by some two or three copies of verses. But in Suckling's light and pleasing airs we never hear the manly ring of the farewell to Lucasta, or the "pure, resolved strain" of the song to Althea. His love verses are graceful, ingenious, or studiously simple, but never tender. There is a touch of Moore's colloquial sweetness in the song "When, dearest, I but think of thee," especially in the last stanza:—

"The waving sea can with each flood
Bathe some high promont that hath stood
Far from the main up in the river;
O think not then but love can do
As much, for that's an ocean too
Which flows not every day, but ever!"

That he sometimes descends to utter coarseness is but a rare compliance with an unworthy fashion. To display his wit he must write on every side of the great theme—even to the blasphemy of the inspiring Cupid, e.g.:—

"Were I to curse the unhallowed sort of men,
I'd wish them to love, and be loved again."

Courtship and gallantry gave special opportunities for saying fine things. These flowers of fancy were to be presented with all ceremony to the mistress of the hour, and then flung aside. If the author showed some degree of contempt for his offering, the effect was enhanced. So full of shapes was fancy, that it alone was high fantastical! When Hazlitt said that Suckling was ranked

without cause among the metaphysical poets—the followers of Donne—he must have forgotten many of the letters, and some of the verses of his author—e.g. the tangle of prose conceits hacked into lengths and called a song, beginning:—

"Unjust decrees, that do at once exact
From such a love as worthy hearts should own
So wild a passion,
And yet so tame a presence
As holding no proportion
Changes into impossible obedience!"

If his best songs are the "origin of the style of Prior and Gay in their short fugitive verses, and of the songs in the *Beggar's Opera*," his "Session of the Poets" is our first example of the personal banter of which "Retaliation" is the best specimen. Apollo summons the poets in order to bestow the laurel "so long reserved" upon the most deserving. Each poet is characterised with no great vivacity. Suckling himself, like Congreve after him, affecting the fine gentleman,—

"Loved not the Muses as well as his sport."

Falkland might have been Apollo's priest as well as his poet. Davenant is bantered for his well-known mischance. There is some dexterity in avoiding all offence to his brethren by the bestowal of the prize on a rich alderman. But Suckling's greatest triumph is in the sustained felicity of his "Ballad on a Wedding." The rustic tone (so well emphasized in the illustrations of the "colt's collar," "our landlord," "the Cath'rine pear," etc.) suggests certain levelling considerations: "Ces hommes si grands . . . ces femmes si polies et si spirituelles, tous méprisent le peuple, et ils sont peuple."

It was original when epithalamia were nothing if not mythological, to idealise in the direction of homeliness, to describe a noble's nuptial in the terms of a country wedding, to lower the imagery without degrading it, to discard Juno for Bridget, and Hymen for the parson, and to be content with candlelight instead of invoking Hesperus. Nobody cares now for Lord Broghill, but we are still (in spite of a phrase or two that we hurry over squeamishly) delighted to take Dick's place, and listen to—

"things without compare!
Such sights as can't again be found
In any place on English ground
Be it at wake or fair."

R. C. BROWNE.

EPOCHS OF HISTORY.*

I.

(1) *The Era of the Protestant Revolution*.
By F. Seebohm.

(2) *The Crusades*. By the Rev. G. W. Cox, M.A.

THE series of which these books are the first fruits is the result of the increasing attention paid to the study of history at schools, and of the dissatisfaction felt with the ordinary manuals used for instruction. The knowledge of the history of a country extending over many centuries can only be given in outline; and though necessary to be learnt, as the multiplication table is ne-

* Edited by E. E. Morris. (London: Longmans & Co., 1874.)

cessary, it is often not much more interesting to the pupils, as it is impossible to go into details, and names and dates are often retained in the memory without any image of reality being called up by them. Each of these books, on the other hand, will treat of a definite period of history, European as well as English; and, as the prospectus states, the writers will endeavour "to bring out in the clearest light those incidents and features on which the mind of the young most readily fastens, and all those characteristics which exhibit the life of a people as well as the policy of their rulers, special attention being paid to the literature, manners, and state of knowledge during each epoch."

The first publication of the series is a concise but withal interesting account by Mr. Seebohm of the causes, progress, and result of what he calls the "Protestant Revolution." Men in England have been contented for a long time with the word "Reformation" as descriptive of the change which all Europe underwent in the sixteenth century; but the feature of the whole movement on which Mr. Seebohm lays the greatest stress is not the theological or moral reformation, but the revolt from Rome as representing ecclesiastical and intellectual tyranny, "the claiming, by the civil power in each nation, of those rights which the Pope had hitherto claimed within it as head of the great ecclesiastical Empire." This view is applicable enough to England, where the people, as a rule, knew and cared little about theology, but resented the papal jurisdiction in ecclesiastical matters, and had for centuries been provoked by appeals in such cases being carried to the Roman courts, and by the collation of foreigners to the best benefices, which they never visited. The parish priests were too ignorant and too near the level of their flocks to have much influence on them, while the preaching of the friars was mainly devoted to obtaining offertories for the churches with which they were connected.

What opposition there was of a purely religious kind to the established order of things in England was directed more against superstitious acts, such as invocation of saints and worshipping images, by which the clergy profited, than against the received dogmas of Christianity. But in Germany the case was different. The origin of the "revolution" may be traced to Luther's reassertion of the doctrine of justification by faith, which he derived from the study of the Bible and of the works of Augustine. On the other hand, the men in England who were most anxious and laboured hardest for the Reformation of the Church, did not accept the doctrine on which Luther's faith was built, and aimed at producing a Church united in the common worship of God and the love of Him and of man, with full toleration for differences of opinion about doctrines. With this party Mr. Seebohm, as might be expected from his previous work, *The Oxford Reformers*, expresses special sympathy, and seems to regret that their spirit was not sufficiently shared by others to have produced "reformation," and widened the Church without the destruction of its unity. He shows, however, that political and social causes rendered it impossible for England to

remain in communion with the Church of Rome, though, after the rupture, heretics from the Catholic faith were still punished, and he gives the Parliaments of Henry VIII. the credit which they deserve for preserving constitutional freedom during the crisis.

Among the results of the Protestant Revolution, Mr. Seebohm does not omit to speak of the reform of the Catholic Church. The attempts of Pole and Contarini to mediate between the Protestants and Catholics, which at one time were by no means hopeless, were frustrated by political exigencies, and the golden opportunity passed, never to return. The rise of the Jesuits, a body as religious and as earnest as the Protestant Reformers, but accepting the authority of the mediaeval Church instead of going back to the Bible, enabled the Catholic Church to define her creed with a rigidity unknown in earlier times, and to incorporate new articles of belief which hitherto had been only partially accepted. This, in the opinion of Protestants, weakens her claim to be considered truly Catholic. It should not be forgotten that while the English Church is an offshoot from the Mother Church of Rome, the Reformed English Church dates further back than the Reformed Church of Rome.

Theology and politics always go hand in hand, and the desire for religious and intellectual freedom was accompanied by revolt from secular authority. Demands for a fairer tenure of land and abolition of the game laws were speedily put forward by the German peasantry. War merciless on both sides was the result, and its changing fortunes are described by Mr. Seebohm in what is by no means the least interesting chapter in his book, illustrated by extracts from the diary of a citizen of Rothenburg, a town which was forced to league with the insurgents. Though references are perhaps hardly needed in a book of this kind, readers would be glad to know where such an extract may be found. The prospectus states that a list of authorities and books for further study will be given in the preface, but in this volume there is neither preface nor list.

Although this book is professedly a school book, and written in a light easy style which the young will find attractive, we can confidently recommend it even to those who possess historical knowledge. All parties are treated with fairness, and their good as well as bad points clearly shown. Mr. Seebohm has not merely compiled the book in the way most manuals are produced, but it is the result of independent work, and the author is, therefore, able to give a lifelike picture of the actors in the story, and knows enough of the period to introduce details naturally and without prolixity.

The second book of which the title heads this article will be more heartily welcomed by schoolboys than the one of which we have already spoken. The enthusiasm and daring of the Crusaders will always have a strong hold on the imaginations of the young, and Mr. Cox's narrative is so clear and graphic that his history of the Crusades will be read for its own sake, and not only as a lesson. The author, in his introductory chapter, explains that the feeling of the sacredness of special localities was totally unknown to the Christians of the first cen-

turies, and was imported by heathen converts, with other characteristics of their religion. His history ends with the ninth Crusade, in which the English Prince Edward gained one victory, but obtained no tangible success. The settlement of the Knights of St. John of Jerusalem at Rhodes after their final expulsion from Palestine is briefly mentioned, and it would have been worth while to devote a paragraph or two to the siege of Rhodes in 1522, when the order showed as much heroism as on any previous occasion, in spite of the apathy of the rest of Christendom; and also to have mentioned the fruitless attempts of the popes to excite the Christian sovereigns to make peace with each other, and resist the inroads of the Turks. The first Crusades were purely aggressive, but during the earlier part of the sixteenth century there was a great probability of the Turk overrunning the whole of Europe, and gaining even more territory than he actually did. The legendary growth by which the history of the Holy Wars is surrounded must have been a strong inducement to Mr. Cox to write their history, though he has made a far more temperate use of comparative mythology than might have been expected. No incidents are distinctly set down as "solar myths," although there are frequent comparisons between the history of the Crusades and the story of the siege of Troy. The list of the companions of Godfrey of Bouillon "is perhaps as much and as little to be credited as the catalogue of Greek warriors in the *Iliad*." This is true enough, no doubt; but when Tasso's Rinaldo is said to be "a being of cloudland, like the Greek Achilles, the Trojan Hektor, and the Persian Rustam," there seems not much ground for the comparison. Many of the characters in *La Gerusalemme Liberata* are avowedly the inventions of the poet, just as those in the *Talisman* are of the novelist; while, even admitting that the Homeric poems are not historic, it is evident that the poet did not invent the chief actors in his story, but merely gave expression and coherence to floating traditions which he believed to be true. But, as we have said, Mr. Cox is very sparing of legendary embellishment, and says nothing either of the angels who hovered over the army of Richard Cœur de Lion, singing, "Seigneurs, tuez, tuez," or of the feast at which the same king entertained the Saracen ambassadors, and caused them to be served with the heads of their countrymen for the second course.

Of the characters of the leaders of all the Crusades, as statesmen and generals, Mr. Cox has a very poor opinion, and he is especially earnest in denouncing their cruelty to their enemies, with whom he compares them most unfavourably. Of the fact there is no doubt whatever, and the historian serves no good end by ignoring it. Still it does admit of palliation. In a savage and but half-civilised age, men can hardly be expected to recognise the common humanity of their fellow-creatures of a different colour and a different tongue. Even in the present day English soldiers would be very likely to bayonet an Ashantee when they would take a European prisoner. But a still further excuse, if excuse it can be called, for the

massacres by which the glory even of Godfrey of Bouillon was sullied, is the fact that the Crusades were religious wars. We can easily imagine how Peter the Hermit and Fulk of Neuilly would refer in their harangues to the wars of the Israelites, and urge their hearers to the duty of exterminating the unbelievers by the examples of Joshua's acts and Samuel's words. When a Jewish king was represented as having lost the divine favour for the crime of sparing an enemy of a different religion, can we wonder that Christians in a grossly superstitious age should have refused to show any mercy to the infidels who were defiling

"those holy fields
Over whose acres walked those blessed feet
Which fourteen hundred years ago were nailed
For our advantage on the bitter cross"?

C. T. MARTIN.

NEW NOVELS.

Jessie Trim. By B. L. Farjeon. (London: Tinsley Brothers, 1874.)

Shadows Cast Before. By Massingberd Home. (London: Chapman & Hall, 1874.)

For the King's Dues. By Agnes Macdonald. (London: Macmillan & Co., 1874.)

A Romance of Acadia. From a Sketch by the late Charles Knight. (London: Sampson Low & Co., 1874.)

THOUGH little Paul Dombey died young, he unfortunately left behind him a numerous progeny of nervous, sickly, old-fashioned small boys, who pervade the novels of the imitators of Mr. Dickens. Chris, the hero and narrator of the tale of *Jessie Trim*, was one of these *enfants terribles*, all through his first volume. He grew out of this unhealthy condition however, and as he grows up, Mr. Farjeon rather drops his more unpleasant imitations of the faults of Dickens. It is almost terrible at first to find oneself once more among elfish children, poverty-stricken mothers, friends called Snaggletooth, enemies who bite their nails to the quick, and other ghosts and shadows of the Dickensian *dramatis personae*. But there are more extravagant copyists than Mr. Farjeon, and though his novel is anything but amusing, we acknowledge with gratitude that his grammar is fairly correct, and that his furniture is not animated, his door knockers do not grin, nor do his umbrellas, coal-scuttles, arm-chairs, and so on, comport themselves as if they had human passions.

The recollections of Chris begin at an even more remote period than the autobiography of Mr. Tristram Shandy. He has heard of his grandmother's marriage so often that he seems to remember it, and to have seen the arrest of her rejected lover, a forger with a tumour on his head, a slit in his teeth, and a habit of biting his nails. After his grandmother's death, Chris and his angel mother are reduced to beggary, from which they are rescued by a surly uncle, who takes them to his house, where he reads the *Age of Reason*, and pursues the trade of a grocer. As Chris is approaching years of indiscretion, a young and skittish lady named Jessie Trim comes mysteriously to live with Uncle Bryan. Chris falls in

love with her, and detests his uncle for the sullen hospitality he yields to Jessie. The uncle is moved to tell his own sad tale, the central incident in which is that his young wife had a cousin, and that he once listened outside his own drawing-room door, and heard the cousin whisper sweet nothings inconsistent with the wife's innocence. When Jessie arrives at the age of eighteen, she opens a mysterious packet which tells her that she is Uncle Bryan's daughter, and that if Bryan had only looked through the key-hole, instead of running away and becoming a grocer, he would have seen that his wife could take care of his honour. Irritated by this disclosure, Jessie disappears, and is believed to be more or less learning to be an actress, under the protection of a certain Mr. Glover. The deserted Chris discovers that Glover has a lump on his head, a slit in his teeth, and bites his nails. There are things, he says with an assurance beyond that of Mr. Galton, which are certain to descend in families, and it follows that the haughty Glover is the son of Chris's grandmother's forging lover, who possessed the same personal habits and attractions. The villain Glover has to admit the relationship, which after all has no bearing on anything; Jessie is restored to Chris, the angel mother's health improves, Uncle Bryan gives up reading the *Age of Reason*, and all is well. There is a good deal of theatrical talk in the book, and a happy theatrical family called West combines many of the charms of the houses of Crummles and Micawber. We might have been more pleased with the really sweet character of the mother, if we had not a faint recollection of having met her before, in another work of Mr. Farjeon's. On the whole, the characters are too good for the plot; but with all its faults *Jessie Trim* is the work of a novelist, and not of an amateur.

"The love of a girl," says Fielding, "is changeable, capricious, and so foolish, that we often cannot guess what the young lady would be at." It is seldom possible to make out what Beatrice, the heroine of *Shadows Cast Before*, would be at. This young lady's brief life is a constant series of melancholy forebodings, which are fulfilled in the most gloomy way. We first meet her at Pau, which for some reason the author chooses to call Geloz. The way in which the scenery and associations of that pretty Pyrenean town are treated is the chief merit, and it is a real and considerable merit, of the novel. The author seems to be suffering from *nostalgie*: there are constant expressions of longing for the distant snow-peaks, the bright *côteaux*, the clear green river, the riding parties, and even the trout, the ices, and the omelettes of that country, which is certainly a pleasant one in spite of the almost unceasing rain. Here it was that young Beatrice saw and loved General Ponsonby, an elderly warrior who might have been her father. The General returned her affection, but for reasons of his own thought it best to leave the scene without declaring his feelings. Deprived of this "goodly marred man," deserted by her Lancelot, Beatrice, with more common sense than Elaine, allowed herself to be wooed and won by a Gawaine—a flower

of courtesy—one Sir Hugh Courtenay. The young lady's hesitations and presentiments are very prettily and touchingly described, and the only fault we have to find with the story is the cruelty of their realisation. We do not intend to betray the secret of the mysterious casket, or tell the tragedy of the Vavasours and Ponsonbys. If the author was determined that her story should end badly, she might have produced an equally melancholy effect without the use of such melodramatic machinery. She writes pleasantly and easily, and only wants a little more vigour and a little more cheerfulness to rise very far above the ordinary ranks of novelists. There is plenty of humour, without a touch of exaggeration, in her description of an unsatisfactory picnic, and in the sketch of the character of Mr. Mason, the fraudulent evangelical guardian of Beatrice. *Shadows Cast Before* would be an excellent novel if the shadows were a little less heavy. As it is, the book will be read with interest, people who like mysterious caskets will read it with breathless interest. We trust that Massingberd Home's next heroine will be a healthy one, and that, if she *must* have a casket like Pandora, Hope, at least, will remain at the bottom.

For the King's Dues is a pleasantly told story, in which the interest attaching to old smuggling days in the Channel Islands makes up for the want of originality in the characters. The scene is in Sark, where the heroine Miss Annie Blunt becomes so absorbed in *The Vicar of Wakefield*, then a new novel, that she lets the tide cut her off in a cave. Heroines have been cut off by the tide before: indeed, if they are not run away with by a horse, chased by a bull, insulted by a ruffian, or exposed to danger in a fire, they almost necessarily *must* come to trouble in this manner. But the cave is a capital cave, and the sea roars in the most natural and terrible way. From this distressing situation Miss Blunt is rescued by the semi-idiot and inarticulate fisher-girl of melodrama, and is dressed up in the fisher-girl's attire. As she makes her way home in this guise, she meets Mr. Frazer, an energetic young naval officer, employed in the pursuit of smugglers. Naturally they fall in love with each other, the heroine having the start by a day or two, as Mr. Frazer is detained by the coquetry of Dolly, the giddy and gay, while Annie is the demure and domestic heroine. It were long to tell how Jack, the brother of the fisher-girl, is accused of being concerned in the death of a revenue officer, how the evidence of Annie, and the courage of the fisher-girl Jeanne, disprove the charge, how vice is punished, and how poetic justice comes by its own. Mr. Frazer is appointed to the *Royal George*, which gallant vessel as we know went down; and we decline further to reveal the secrets of Miss Agnes Macdonald, who has written this really pretty tale, apparently for girls. The book is an excellent substitute for the works of Miss Yonge, and as such we recommend it to families. We would like to have made Jeanne, the inarticulate fisher-girl, in love with Mr. Frazer, which would have introduced some pretty complications. But the story is very well as it stands.

A Romance of Acadia is a novel in which

a daughter and grand-daughter of Mr. Charles Knight have completed a sketch which he left unfinished. The chief incidents and characters are drawn from the early history of Nova Scotia, the times of French and Scotch adventurers. Perhaps history never supplied the materials ready made of a more sad and beautiful story. There is a fervour of unrewarded love, a crossing of passions, a wealth of terrible incidents, which are only equalled in natural interest by the legend of the Niflungs and Volsungs. Things might so easily have gone well with Victoire and Jeanne Marie, with De la Tour and William Alexander, and in the tumult of civil and religious war they do go so hopelessly ill. Marie Jeanne and Victoire are cousins, Acadian maidens, the latter betrothed to William Alexander, son of Lord Stirling, who dies before their marriage. De la Tour, the patriotic French defender of the French settlement, is in love with Victoire, and Jeanne Marie is in love with De la Tour. On Alexander's death Victoire marries De la Tour, while Jeanne Marie is compelled to marry De la Tour's deadly enemy, D'Aulnay de Chernisé. In the private war between De la Tour and De Chernisé, Victoire is captured by De Chernisé, her garrison slain before her eyes, and she is only saved, by her cousin's intercession, to die of the shock in De la Tour's arms, murmuring deliriously about her first lover. This death-scene is the central point of the novel, and here the writers of the romance do justice to the tragic elevation of the theme. In the course of years De Chernisé dies, and De la Tour marries Jeanne Marie, who has loved him all the time. He of course is still faithful in heart to the memory of Victoire, as she was to that of Alexander, and thus no two passions are fulfilled. One can only regret that the subject did not come under the notice of the writer of *Esmond* and of *Denis Duval*. It is still readable and touching, in spite of writing which is sometimes languid, and inability to supply local colouring, in this combined effort of Mr. Knight and his family.

A. LANG.

Les Archives du Vatican. Par M. Gachard, de l'Académie et de la Commission Royale d'Histoire de Belgique, des Académies de Vienne, de Madrid, d'Amsterdam, &c. (Bruxelles: G. Muquardt, éditeur, Henry Merzbach, successeur, Libraire de la Cour, 1874.)

THE magnificent collection of Records belonging to the Apostolic See has for centuries not only been closed to the public in general, but even as late as the year 1853 the reply given to the Belgian Minister at Rome, upon application being made for M. Gachard to have admission to the Vatican Library, was that no one was allowed to attempt to intrude there, under pain of excommunication.

Nevertheless, Marini, who had had them under his care for forty years, wrote a history of them, which was published after his death by Cardinal Mai in 1825. M. Gachard supposes that Marini must have written before the year 1810, inasmuch as he makes no allusion to the removal of the Pontifical Archives

from Rome to Paris in that year, by order of Napoleon. From this volume, as well as from the accounts which exist in the National Archives of France, and from researches made by himself personally at Rome during the term of a five years' residence in the Eternal City, M. Gachard has produced a most valuable history both of the documents themselves—though, of course, his account contains nothing about their details—and of their fortunes from the fourteenth century to the present day.

We can only express our wonder both at the enormous number of volumes and at the small amount of loss that has been sustained by their pillage in 1810, and their subsequent restoration to their proper home. Readers may form some idea of the historical treasures that yet remain uncalendered and unknown, when we say that the number of cases in which the books and papers were contained exceeded 3,000, and that the cost of transport from Rome to Paris nearly reached 25,000*l*.

The most interesting part of M. Gachard's brochure is that in which he describes the volumes which come under the head of *Nunziatura di Fiandra*. Father Theiner, who had succeeded Marini as Keeper of the Archives, permitted him to see and judge of these documents for himself, and he has given us a few details of the contents of six of these volumes, which refer to the latter half of the sixteenth century. What will most interest English readers is the description of what was going on whilst Cardinal Pole was detained in the Low Countries on his way to England at the commencement of the reign of Mary. All these letters are contained in two volumes, numbered respectively D. 3,392 and D. 3,393, in the *Nunziatura di Fiandra*. The next volume jumps over a period of nearly forty years, beginning in the winter of 1592.

We cannot attempt to give any, even the briefest analysis of any of these papers, which suggest to us the thought how much remains to be done as regards these Vatican documents. The Vatican Transcripts at the British Museum are a miserably deficient collection, and what Father Theiner has added to them in his splendid collection of *Monumenta Vaticana* is simply a small specimen of the treasures contained in that magnificent repository. M. Gachard, in alluding to the late Father Theiner's kindness and courtesy, speaks of them as being equal to his knowledge. He probably has not very minutely inspected the numerous volumes of documents for which we are indebted to Father Theiner. Had he done so, he could scarcely have complimented him on his knowledge of history. The headings and the table of contents prefixed to the documents he has published betray either great ignorance of the facts of English history, or great carelessness in deputing this part of his task to very incompetent hands. The papers, also, in the volume which refers principally to Scottish and Irish ecclesiastical affairs, are full of faults of transcription and errors of press. In this respect they form a remarkable contrast to the editorial skill displayed by the writers in the employment of the Master of the Rolls.

NICHOLAS POCCOCK.

CURRENT THEOLOGY.

Lenten Sermons, preached chiefly to Young Men at the Universities, between A.D. 1858—1874. By the Rev. E. B. Pusey, D.D., Regius Professor of Hebrew, and Canon of Christ Church. (London: James Parker and Co.; Rivingtons. 1874.) Every one will be thankful for the appearance of this volume, which furnishes, perhaps, the worthiest representation of a mind that has exercised on two generations an influence, if not unmixedly for good, yet sustained exclusively by force of goodness. There is probably no one now living comparable to Dr. Pusey for practical insight into the phenomena of the conscience, combined with the power of influencing it; and in Sermons like these we have him dealing directly with the human conscience, the most interesting and most fruitful of the subjects he is accustomed to deal with, even if the powers shown in his controversial works be not inferior. Here there is nothing controversial, and little argumentative. It would indeed be no credit to the author if it could be said that his practical moral teaching was quite irrespective of the theological system with which his name is identified; but it is his wisdom to know that the way to make a system practically efficacious is not to enunciate it repeatedly, far less to attempt to demonstrate it, but to take it for granted as a whole, and apply it in detail; its deepest principles, at least, being rather assumed than stated afresh. Most of the sermons, naturally, belong to the well-known Lenten courses at St. Mary's and St. Giles's, Oxford, organised by the late Bishop; a few were preached similarly at Great St. Mary's, Cambridge; and others (including the latest) at College services in Christ Church. Perhaps the two which, if not the best as sermons, give the highest impression of versatility and rhetorical power, are the Knightsbridge sermon (previously published separately) on "Our Pharisaism," and one of very similar tone on Dives, also preached in a fashionable London church. The rest, though specially adapted to their academical audiences, have nothing obtrusively academical in their tone or subjects: indeed, perhaps a little more such character in one direction, and less in another, might have been desirable. We could have spared such fragments of scholastic method as the enumeration (more than once repeated) of the seven deadly sins; and the statement, in the sermon on "The Losses of the Saved," of what may be called the primitive oriental theory of a Purgatory confined to the Day of Judgment, serves rather to distract attention from the practical lesson than to enforce it. On the other hand, it is rather curious that the correctness of the A. V. in Acts xxvi. 28 is assumed without question—still more so, that we find revived (of course also without discussion) the explanation of St. Paul's "thorn in the flesh" which Bishop Bull rejected with such horror. But things like these do not detract appreciably from the value of the book: they might irritate a hearer for the moment, but they cannot mislead or perplex a reader. Knowing the influence Dr. Pusey has had as a preacher, it would be rash to say his sermons are less effective to hear than to read; but it may safely be said that every one will learn much from reading these sermons, whether he has already heard any of them or no.

Apollos; or, The Way of God: a Plea for the Religion of Scripture. By A. Cleveland Cox, Bishop of Western New York. (London: James Parker & Co., 1874.) Bishop Cox was the author of a number of devotional and ecclesiastical verses, published as long ago as 1839, one of the most graceful and not the least popular of the many similar collections of that time, the aftermath of the *Christian Year*. It was remarkable that such a boyish work should contain so much genuine poetry—still more remarkable that it should combine, in a way then rare on this side of the Atlantic, strict Tractarian principles with warm and earnest sympathy for the religious strength

and weakness of "Dissenters." The fruit of this moderation of temper is to be seen in the fact that the writer's mental and theological attitude has remained unchanged for more than thirty years. He invites the pious and orthodox members of the respectable "denominations" in America—who are disgusted at the extravagances to which their religious anarchy has given rise—to come and study with him "the way of God more perfectly," which will, he has little doubt, lead to their hearty union in the Protestant Episcopal Church. The tone and style are such as recal to mind the academical origin of Tractarianism; for the decline, in one part, into the manner of newspaper controversy, is no doubt intentional, and, so to speak, dramatic; and the merits of the book may perhaps serve to render credible the alleged fact that the Episcopalian mission is the only one that has had any success among the Mormonites.

The Solidity of True Religion, and other Sermons preached in London during the General Election and Mission Week, February, 1874. By C. J. Vaughan, D.D., Master of the Temple, and Chaplain in Ordinary to the Queen. (London: Henry S. King & Co., 1874.) We spoke so lately of the characteristics of Dr. Vaughan's preaching that this book does not require any detailed notice; else it would deserve one, having more "backbone" than any four sermons in *Words of Hope*.

Jesus the Messiah. By Charles T. Beke, Ph.D., Fellow and Medallist of the Royal Geographical Society; Author of "Origines Biblicae," &c. (London: Trübner & Co., 1874.) The cobbler who goes beyond his last is supposed to make himself ridiculous; but it is not because he has tastes not confined to his trade, but because his tastes as well as his trade are those of a cobbler. When a clever man, habituated to an intellectual pursuit, writes on a subject which he has only studied very superficially, the result cannot be scientific and may be grotesque, but it is not unlikely to be interesting and even suggestive. The late Dr. Beke published this book anonymously two years ago, to prove the proposition implied in the title. Just before his death he had directed the remaining copies to be issued with his name, as "a reply anticipatory to the work *Supernatural Religion*." He differed from the author of that work in having no *a priori* reluctance to accept miracles if sufficiently attested; he considered the first two Gospels, though not traceable to a single responsible author, to be substantially historical; the third to be a *bona fide* collection of the Christian legendary cycle as believed in the second century; and the fourth to be a scandalous forgery, clumsy and malevolent as well as fraudulent. From the three former he thought it possible to reconstruct a story of the life, teaching, and death of Jesus; correct, not only in outline, but in many of the details; for His Resurrection, while the Evangelists are admitted to testify to the fact that it was believed, St. Paul, as the only witness whose evidence is authenticated by his name, is treated as practically the only one, and the evidence arrayed by him is received as authentic and demonstrative. Dr. Beke may be said, in this last point, to play fast and loose with the uncertainty of his authorities, but so far there is nothing absurd in his conclusions. It is otherwise when he interprets St. Paul's doctrine that the Resurrection was a "spiritual" fact, into the belief that what "was seen of Cephas, then of the Twelve," &c., was the ghost of popular belief, that can be seen and not handled, while what any sane man would call the real Body remained in the tomb; still more when he imagines a vast clerical conspiracy, of Gentile not Jewish origin, which deliberately superseded St. Paul's Gospel by forging St. John's. It is a curious example of time's revenges that St. Paul should be selected as the patron of what is virtually a revived Ebionitism—it is asserted *totidem verbis* that the Apostle of the Gentiles was "a Reformed Jew."

A Memoir of the Rev. John Keble, M.A., late Vicar

of Hursley. By the Right Hon. Sir J. T. Coleridge, D.C.L. (Fourth and Cheaper Edition, 1874.) In this edition of Keble's life, as in the last, no material alterations are made; for instance, passages are left unaltered which allude to Bishop Patteson as living; the short preface, everyone will be sorry to see, ascribes this to the failing strength of the author. The new edition is thus chiefly important as showing how many people are interested or edified by the fact, that a man far spiritually superior to most of his contemporaries did not find it possible to lead in our day a life much superior to that of many of them.

The True History of Joshua Davidson, Christian and Communist. By E. Lynn Linton. Sixth edition, with a new preface. (London: Chatto & Windus, 1874.) The extensive popularity of this book is rather hard to account for. As a statement of the incongruity between modern society and a consistent enthusiast who took his moral ideal from the Gospels, it has far less plausibility than the little pamphlet *Modern Christianity a Civilised Heathenism*, written by one who had already a reputation as a pamphleteer; as an attempt to adapt the Gospel narrative to modern times it fails, and perhaps the authoress felt it failed, if only because the modern Joshua was compelled to take conscious account of his assumed predecessor. But the failure is not only manifest where it was unavoidable; there is a total absence of judgment in the attempted discrimination between the temporary and permanent elements in the life of Christ. If anything is certain about Him, and may be considered characteristic, it is that He refused to exchange His "method" of appealing to the conscience for a hold on working political forces. There were as many revolutionary elements in Galilee as in London, or even Paris, and in good hands they had almost as fair a chance of success; and therefore the reasons which then forbade a coalition with them must be such as apply now. In comparison with so fundamental a mistake, it is hardly worth pointing out that it is mediæval tradition, not the Gospels, which suggested the "Disputation" in the Temple, and which led the authoress to make "Mary" a reclaimed prostitute, instead of a cured lunatic. And it is a really absurd catastrophe that a man who had been shot by neither side in the Commune should be killed by a Conservative mob in England—a fate that for at least a generation has never befallen anyone who did not do as much as Murphy to provoke if not to deserve it. The new preface adds nothing to what anyone might learn from the book itself, except the authoress's reason for avowing her name, viz., that everybody knew it.

Speeches on Missions. By the Right Rev. Samuel Wilberforce, D.D., late Bishop of Winchester. Edited by the Rev. Henry Rowley. (London: W. W. Gardiner, 1874.) Mr. Rowley deserves thanks for having ventured on what is naturally a thankless task, as well as a laborious one, in disinterring these speeches from the series of contemporary reports. Speeches at missionary meetings were among the chief fields of Bishop Wilberforce's talents, and the next two or three generations would be vexed if they had no record of them; but his speeches were real speeches, meant to be heard, not read; and it must be confessed that a volume of them is rather monotonous reading.

Clearer Light: or, the Teachings of the Bible respecting the Creation, the Original Inhabitants of the Earth, the Diversities of the Human Race, and other Questions of the Day. By a Layman. (London: Elliot Stock, 1874.) It is a real misfortune for the author of this extraordinary little book that he did not live in the second century. If he had, he would probably have just escaped excommunication, and would now be quoted as remarkably anticipating the results of modern science, and showing the freedom with which Scripture might safely be interpreted; as it is, he

shows that he has learnt nothing either about Scripture or science from coming 1,700 years later. His book is naïve, crude, ignorant to the last degree, but not very ill-written.

WILLIAM HENRY SIMCOX.

NOTES AND NEWS.

MR. SERJEANT COX has in the press a treatise on *Heredity and Hybridism*, in which he will adduce the various facts and arguments that support his theory of the structure of all organised beings by the junction of two germs.

MR. AND MRS. ARTHUR O'SHAUGNESSY have in the press a book entitled *Toyland*, a volume of stories "für grosse und kleine Kinder." It will appear in their joint names, and will be published by Messrs. Daldy, Isbister and Co.

MESSRS. CHATTO AND WINDUS will publish immediately, by arrangement with the author, an English translation of the Comte de Paris' *Histoire de la Guerre Civile en Amérique*.

JUÁREZ, the late President of Mexico, has left in MS. an interesting autobiography, which is to be shortly published.

THE collected edition of Mr. Sydney Dobell's works, of which we spoke some weeks ago, will be issued in two handsome volumes. The publication is postponed until about the end of January. Messrs. Smith, Elder and Co. will, we understand, be the publishers.

Out of the World is the name of the new novel by Miss Healy (M^{me}. Charles Bigot), which Messrs. Sampson Low and Marston will issue in about a month. It may be remembered that Miss Healy's earlier novel, *Lakeville*, speedily reached a second edition.

It may interest Orientalists to learn that Mr. Reginald Stuart Poole has identified, among unclassified oriental coins in the British Museum, a silver coin of Shah Shujáá, second son of Shah Jehán, and one of the competitors for the throne in the war of the succession that ended with the accession of Aurangzêeb. The reverse-area of the coin bears the inscription, "Mohammad Sháh Shujáá, Báidsáh Ghazee;" the obverse-area bears the date 1068, and in the margin the names and qualities of the four Orthodox Khaleefehs, a circumstance in direct contradiction of Aurangzêeb's charge of Shiya'ism. The coin in all respects bears a close resemblance to Murád Baksh's silver money (Prinsep, ed. Thomas, ii. p. 49, Useful Tables).

WE may also mention the acquisition by the British Museum, through the kindness of Colonel Seton Guthrie, R.E., of a Patan Sultan of Dehli hitherto unknown, Mahmud, son of Mohammad Ibn Taghlak, who must have been the pretender (?) set up after the accession of Feeróz III. in 752, the date borne on the coin (Thomas, *Chronicles of the Patans*, p. 269). Colonel Guthrie possesses a second specimen.

MR. W. J. CRAIG, of Trinity College, Dublin, has been engaged for many years back on a Glossary of the Obsolete Words, and Senses of Words, in Shakspeare's Plays and Poems, with full illustrations from contemporary writers. He treats the words more fully than Nares does, and takes in particles as well as longer words. Mr. Craig has also long made a special study of Shakspeare's play of *Cymbeline*, and has undertaken to edit it for the New Shakspeare Society.

MR. SKEAT is to edit a second collection of Chaucer's *Canterbury Tales* for the Clarendon Press School Series. This, with Dr. Morris's first set, and Mr. Skeat's first set, will make three Chaucer volumes in the Series, and Dr. Morris's Minor-Poems Selections will add a fourth.

WE understand that a selection of Addison's *Spectator* Papers, gathered under the different subjects they treat of, is also to be added to the

Clarendon Press Series. It will make an interesting volume.

THE series of publications of the English Dialect Society for the year 1873 has already been announced as follows, viz.:—(1) Reprinted Glossaries, 1—7, Series B, Part I.; (2) A Bibliographical List of Books relating to Dialects, Series A, Part I.; (3) A Glossary of Swaledale Words, by Captain Harland, Series C, Part I. Of these only the first has yet been issued; and, though the others have been long delayed, the delay has been inevitable, owing to the difficulty of compiling the Bibliographical List, which is the work of many hands. But meanwhile the publications for 1874 are making good progress, and may be expected to be completed by the end of the year, as promised in last year's report. The list of them is as follows:—(4) A History of English Sounds, by H. Sweet, Esq., Series D, Part I., to be published for the Philological and English Dialect Societies conjointly; (5) Reprinted Glossaries, 8—14, Series B, Part II., of which Glossaries 8—12 are already printed; (6) Ray's Collection of Words, from the edition of 1691, with additions from various sources, to which will be appended Thoresby's Letter to Ray, also containing a glossary, Series B, Nos. 15—17, Part III. Nearly all the responsibility for five out of six of these works has fallen upon Mr. Skeat, in consequence of the difficulty of completing other promised contributions in good time; but, as some of these are now well advanced, other members will take their share of the work in coming years. The publications for 1875 are not yet fixed upon definitively, but enough has been promised to provide, not only for next year, but for 1876 also.

THE last number of the *Arbeiterfreund*—the Berlin organ of the "Central Association for promoting the Welfare of the Working Classes," edited by Professor Gneist of Berlin, and Professor Böhmert of Zürich—contains a German translation by Dr. M. Waldeck, with notes adding some curious and interesting facts, of Mr. Cliffe Leslie's recent essay in the *Fortnightly Review* on the "Movements of Agricultural Wages in Europe." The publication of the number of the *Arbeiterfreund* referred to has been delayed by Professor Gneist's visit to the United States.

THE death is announced from Paris of M. Taschereau, late director of the National Library. He was specially entrusted with the preparation of the catalogues, and was known in literature by his editions of Molière, Boufflers, and the correspondence of Grimm and Diderot, and by his histories of the life and writings of Molière and Corneille.

THE flag is a factor of such importance in French politics, that M. Gustave Desjardins has done well in publishing a complete volume of *Researches on French Flags*. The work is entirely based on authentic and official MSS., tapestries, tombs, contemporary engravings, &c., and the author gives the banner, standards, and pennons of the French Monarchy from Charlemagne downwards, while he has rescued from oblivion the Huguenot flag, and the National flag under which the French freed themselves from the English yoke during the Hundred Years' War. He also traces the history of the naval and military flags, and of the national marks, cross, scarf, cockade, &c., together with the result of his researches on the French *écus*; the devices of the kings from the time of St. Louis, and their personal emblems to Louis XIV.; the liveries of the House of France, and of its different branches, &c. The work, which is copiously illustrated, is published by Messrs. Morel et Cie. at the price of fifty francs.

THE *Nation* announces that a brief and authentic account of the origin of the names of the several states and territories of the Union is to be undertaken by a committee of the American Antiquarian Society.

THE Italian Government has determined on establishing three large libraries at Rome—the Alessandrina, at the University; the Casanatense, at the Minerva; the Angelica, in the old convent of St. Augustin. These libraries are already in existence, but they will be considerably enlarged, and will be enriched with immense treasures in the shape of books and manuscripts which have hitherto been buried in the old convents. It has not yet been decided whether the Vallicelliana library, established in the monastery of San Felipo, shall be preserved or dispersed.

In the *Revista de España* Señor M. A. Martínez's studies upon Property bring him to the communistic theories, and he sketches the Socialist Utopias of Plato, Sir Thomas More, Campanella, and Morely. He points out that none of the modern Utopians have any right to rejoice in Plato's book, for the spirit in which it is conceived is opposed to the humanitarian philosophy which forms their basis. Plato's highest conception of social organization is not even the nation, but the city. Señor Martínez points out a certain resemblance between the social orders of the *Republic* and those of India. Victor Balaguer sketches the life of Folquet, the Provençal poet, who late in life became an ecclesiastic, and distinguished himself for cruelty and treachery in the crusade against the Albigenses. The beauty of his poetry is less apparent than the ugliness of his life. Señor Evaristo Marten Contreras de Rajas, in an article on "The Transit of Venus," laments the apathy which exists in Spain with reference to the scientific movements of the age. An interesting account of Spanish and American work at the Zendavesta is taken from the *Augsburg Gazette*.

THE November number of the Danish magazine, *Det Nittende Aarhundrede*, opens with a very good poem in terza rima, by Professor Chr. Molbech, the translator of Dante. A. C. Larsen, in an "Open Letter to Professor Clausen," continues the anti-theological polemic that has made his name so famous lately in Denmark. Dr. Georg Brandes concludes his weighty and brilliant study of Paul Heyse. Ad. Hansen translates from Swinburne's *Songs before Sunrise*, the "Pilgrims" and "Genesis." The translation is accurate and sympathetic, but it is not wonderful that the Danish fails to render fully the delicate melody of the first-named poem. The number further contains a very charming study of the poems of the late Ludvig Böttcher. E. Brandes gives a criticism of some of the dramatic individualities in the works of Holberg and Heiberg, and finally a statement of the present position of the Rigsdag in relation to the Danish National Theatre. The praise we accorded to the first number of the magazine is, at least, equally due to this the second, and the contents are of more varied interest.

GERMAN child-literature continues to flourish as of old, and among its most recent additions none deserves more praise than the *Pen and Ink Sketches of Animal Life* by Aglaia von Enderes, which have just been published at Buda-Pesth.

DR. FRANZ REBER has completed Parts I. and II. of his History of Modern German Art from the end of the last century to the Exhibition at Vienna, 1873, considered in relation to the condition of contemporaneous Art in France, Belgium, Holland, England, Italy, and Russia.

A CONFERENCE was lately held at Munich to deliberate on the best means of dealing with the question of Dr. Ukert's well-known Encyclopædia of Modern European History. The scheme originally proposed by him embraced all the States of Europe, but he unfortunately did not secure the completion of many of the separate histories; and the committee with whom rests the direction of the further prosecution of this task have had a herculean labour to reorganise the undertaking. They now announce that the fifth volume of the History of Sweden, the earlier volumes of which were written by Professor Gejer, has been com-

pleted by Councillor Carlson of Stockholm, and will appear in a few days; while the fourth volume of the History of Poland by J. Caro is in the press. The histories of Switzerland, Prussia, Bavaria, and Italy have been assigned to competent authorities and are promised at an early date, while negotiations are in hand for the completion of the remainder of the unfinished histories.

An article by Signor Cesare Paoli in the last number of the *Archivio Storico*, shows that Italian students of Florentine history are not as yet prepared to sacrifice Dino Compagni to the recent attacks of Herr Scheffer Boichorst in his *Florentiner Studien*. Signor Paoli admits the discrepancies which are proved to exist between Dino on the one hand, and documentary evidence or Villani on the other; but after giving a summary of all these passages he still asks if they are enough to condemn Dino's chronicle as a forgery of the sixteenth century. Errors of fact, he urges, are not sufficient proof of falsity in a contemporary chronicle; nor is the verbal agreement of Dino in the Villani in some passages a sufficient proof that Dino's chronicle was based by some later forger on that of Villani. Herr Boichorst's method is founded on a prejudice and an assumption. The prejudice is, that Dino's chronicle is a forgery; the assumption is, that it is founded entirely on Villani. Given those two points, the method is tolerably simple; if Dino agrees with Villani it is a sign that he has copied from him; if he differs from him, he is acting from a deliberate desire to contradict him; if he adds anything to Villani's account, it is a clear proof that he is inventing. Moreover, if the statements of Dino are confirmed by original documents, that only shows that the forger had seen the documents and availed himself of them; if the statements of Dino are not confirmed by the documents, then, of course, they are mere forgeries. "By this method of criticism," complains Signor Paoli, "Dino is damaged by what he omits as well as by what he narrates, damaged equally whether what he has told is correct or incorrect." It is to be hoped that the controversy which Herr Boichorst has now definitely raised about Dino's authenticity will not be allowed to settle without a thorough sifting of the question. Besides the charm of Dino's chronicle in itself, its importance for the knowledge of Dante is so great, that many questions about the interpretation of the *Divina Commedia* must remain suspended till Dino's value as an authority be decidedly settled.

IN noticing the death of Mr. John Gough Nichols just a year ago, we drew attention to the varied and valuable labours of his busy life. His brother, Mr. R. C. Nichols, F.S.A., has now published a detailed *Memoir* of the antiquary, together with a complete list of the works of which he was either the author or editor. Many of these are important contributions to the departments of antiquarian and genealogical literature, and all are distinguished by what we must term an exceptional love of truth. Mr. Nichols combined in a rare degree the habits of research which are common to all genuine antiquaries and the facile literary style which few of them possess. He was a good scholar, well acquainted not only with the broad track, but also with the by-ways of history, and as ready to impart information as he was eager to acquire it. It was perhaps his modesty that kept him back from the accomplishment of any one great work with which his name will be permanently associated; but it is only fair to add that all that is most valuable in the new edition of Whitaker's *History of Whalley* is from his pen, and that the aid which he gave to Sir R. C. Hoare in the *History of South Wiltshire* was of the most solid character. We never take up the *Gentleman's Magazine* without regretting that it passed out of Mr. Nichols's management, and now possesses nothing to distinguish it from the general "ruck" of periodicals. Is there no one left to assume the post which he once so ably filled, and to direct the course of genealogical re-

search to better objects than the increase of family pride?

THE second chapter of Mr. Peter Bayne's "Charles I. and his Father" in the *Contemporary Review* is hardly so satisfactory as the first. There is, no doubt, the same insight into character, the same readiness to abandon old prejudices, the same determination to ask how the world looked when viewed through the eyes of the person whom he is for the time describing, rather than merely to ask how it looked through the eyes of that person's adversaries. Yet, though Mr. Bayne's Charles I. is a far nearer approach to the real man than Lord Macaulay's or Mr. Forster's, it leaves much to be desired. The idea which Mr. Bayne shares with most other writers, that Charles's first answer to the Petition of Right was the result of shuffling and evasion, is one which falls to the ground when once the full records of that important session are examined, and it is seen that Charles's hesitation was shared by that large party in the House of Lords which, headed by Bristol and Arundel, stood entirely aloof from Buckingham and the Court. Again, Mr. Bayne is only repeating the popular story when he says that "Charles had no sooner pocketed the subsidies and prorogued Parliament, than he contemptuously broke his promise." If Mr. Bayne had examined the evidence himself, instead of writing from other people's statements who let their wishes overpower their judgments, he would certainly have come to the conclusion that no fact is known to justify so harsh a sentence. But the great defect in the article is the failure to remember that if Charles's attachment to Laud must have seemed very like Popery in the eyes of the Parliament of 1629, the resolution of the Parliament of 1629 to call in question the slightest deviation from the Calvinistic creed must have seemed with even greater reason something very like persecution. Charles's remedy for the disease was not a wise one. But there can be no doubt that he believed it to be called for by the circumstances of the case. The idea of the Commons was uniformity of doctrine. Charles's idea was uniformity of ritual, with silence on disputed points of doctrine. Mr. Bayne speaks well and wisely with no little indignation against those who speak of Laud as an imbecile, and in the main he is doubtless right in his estimate of the causes of Laud's failure. But there is a passage in Laud's correspondence which he does not appear to have noticed, and which admits us into that higher mood which makes even his mistakes and blindness seem almost respectable. His correspondent Vossius wanted to know something about the session of 1629, then just brought to an untimely end. On July 14 Laud answers:—

"Omne ego semper movi lapidem, ne publice scopulose illae et perplexae quaestiones coram populo tractarentur; ne pietatem et charitatem sub specie veri violarentur. Moderata semper suavi, ne fervida ingenia, et quibus religio non est summa curae, turbarent omnia. Nec forte hoc placuit, sed memini tamen quam serio suis Salvator claritatem commendavit. Quam caute patienterque voluit Apostolus cum infirmis agi. Si his artibus peream, factus inter litigantes victor, ut solet, praedia, merces mea mecum, nec extra me, nisi in Deo, solatium quaeram. Interim quae spero pauciora sunt, quae timeo multa. Nec habet Reformata Ecclesia quod magis doleat cavet quo, quam gladio unico apud alias gentes petita, ne apud nos vosque ubi tutius degit, propriis manibus lacerata, graviore scissura, in partes primo, deinde paulatim dividendo in minutias et sic in nihilum evanescat."

The whole passage is in many ways worth studying for those who wish to understand the position of Laud and Charles in religious matters.

NOTES OF TRAVEL.

THE Chambers of Commerce throughout France have just received intimation from the governor of the islands of Saint Pierre and Miquelon off Newfoundland, of the erection of a steam whistle

for use in foggy and snowy weather, at Galantry, close to the lighthouse. The whistle will sound for six seconds at a time every minute, during the continuance of such weather, and on the arrival of the Halifax mail boat. It will be audible at a distance of from ten to fifteen miles.

FROM the *Moscow Gazette* it appears that during the present year gold has been obtained in large quantities from the region of the Upper Amur, in Eastern Siberia, and up to the date of the communication it amounted to 150 puds of pure metal.

THE recent levelling party charged with the duty of determining the respective heights of the Aral and Caspian Seas has just returned to Orenburg. The calculations make the height of the Sea of Aral 250 feet above the Mertui-Kulduk Bay of the Caspian, and 165 feet above the sea level. Previous calculations had made the difference between the Aral and the Caspian 117 feet only; the present measurements therefore cannot be held to be thoroughly trustworthy until it is ascertained whether the surprising increase in difference between the height of the two seas is due to a rise of the waters of the Aral or (as is probable) to a depression of those of the Caspian. In the latter case the Aral will of course lie less than 165 feet above sea-level.

THE Oxus Expedition has also completed its labours, and Colonel Stoletof, Major Wood, M. Smirnoff, the botanist, and M. Severtsoff, the zoologist, will all return by way of the eastern channel of the Oxus to Fort Kazalinsk, whence M. Severtsoff will make his way to Tashkent, while M. Barbot de Marney, a geologist, has undertaken to cross the Kizyl Kum desert to Samarcand.

THE discovery of petroleum springs on the Lüneburg Heaths in Northern Germany promises to convert this once barren and apparently unavailable tract into what might by comparison be designated as an El Dorado. Borings were made at Oberg by Hanoverian and French surveyors as early as 1863, but then the measures taken failed to confirm the opinion which had been previously advanced of the presence of oil. Since then the heath has been drained and rendered fit for cultivation, and recently it has been shown that petroleum can be obtained by simple borings, and that at some spots, as at the village of Wietze, the sand is saturated with rock-oil. In this part of the heath since 1852, when the owner of the land caused a shaft to be sunk, petroleum has been obtained without intermission, although the process adopted for its extraction has consisted in little more than a mere washing of the sand, through which the oil was suffered to run into vessels prepared for its reception. In clearness, purity, and specific weight, the Lüneburg oil is said to be identical with the American rock-oils, and it is almost without smell of any kind.

DR. PH. WOLFF has sent a report to the *Allgemeine Zeitung* of the present condition of the German colonies founded in Palestine in 1872. At that time the attempt to make settlements of this kind in the Holy Land was limited to Haifa and Jaffa, but now there are in all five German colonies—Jerusalem, Ramleh, and Garona having been included in the national scheme of colonisation. About 560 persons are distributed over the different areas, and thus far it would appear from Dr. Wolff's report that the missions have been conducted with judgment and success, and that the various experiments in farming and cultivating the land in accordance with European maxims of agriculture and horticulture bid fair to produce important results, which cannot fail to have a wide-spread influence on the future development of the districts. The direction of the mission rests now exclusively with Dr. Christoph Hermann, who reports that its expenditure for 1873 was met by the sums subscribed for its support, and that it has at its command a capital of 150,000 florins.

RUSSIA has until recently drawn the greater quantity of her coal from England, but the discovery some years ago of deep and extensive coal-beds in the Jekaterinoslaw district has now enabled her to dispense with foreign supplies. These newly opened mines, which are in the lands of the Don Cossacks, lie at a depth of about 200 feet, and the yield has this year been so abundant that many thousand tons have already been shipped from the port of Taganrog, although in 1870 not more than forty or fifty tons were raised. It is thought that if the mines continue to yield a steady supply, they may possibly exert a favourable influence on the Suez Canal steam navigation, which has hitherto been entirely dependent upon English resources. Indeed the whole length of the Mediterranean and all countries on the route to India and Japan have drawn their coal from England, and although owing to the difficulty of transport to the Sea of Azof and the mouth of the Dnieper, the thinness of the population and the agricultural occupations of the people of the intervening districts, a long time must elapse before the Jekaterinoslaw coal can compete in foreign markets with English coal, there seems every reason to expect that in time Russian supplies may be made, through the agency of railroads and increase of population, to form a very important item in the category of Russian exports.

THE city of Damascus has good reason to be anything but gratified by the success of M. de Lesseps' grand enterprise. Before the construction of the Suez Canal Damascus was the last place where the many thousands of Moslem pilgrims, coming from the vast populations of Central Asia, on their way to the Hedjaz, halted, not only to recruit their strength for the perilous journey across the desert, but to purchase stores, baggage, animals, &c. Large purchases are also even now made of the gorgeous costumes worn in Central Asia, which Damascus manufactures. These are conveyed to Mecca and laid on the tomb of the Prophet, whereby they are deemed to acquire some of its sanctity, and are then carried back by their owners to their countries. The conservative feeling of fanaticism, however, has not been able to withstand the facilities and comforts of the sea voyage through the canal to Jeddah, and the merchant also sends his goods that way. Damascus, therefore, now stands comparatively neglected.

A PARTY of English engineers have recently surveyed, on behalf of the Viceroy of Egypt, the coal-field of Dranista, and excavated from it some 350 tons of coal. This coal-field is situated about fifty miles to the south-west of the town of Salonica, and is enclosed by a range of mountains of crescent shape, commencing on the south at Mount Olympus, and terminating on the north at the Bay of Kitros in the Gulf of Salonica. There is an aggregate thickness of about eight feet of coal, extending over a known area of about 2,000 acres; but it is highly probable that the coal-field is of much greater extent, and the engineers are of opinion that there is a total area of thirty square miles in which the above thickness of coal would be found, and which in round numbers would contain 255,000,000 tons of coal, which appears to be of good quality.

DR. GERHARD ROHLFS' new work *Quer durch Africa*, true to its title, carries its readers straight through Africa from one ocean to the other. Since the death of Livingstone, this indefatigable traveller has ranked as the only explorer who has traversed the African continent from coast to coast, and it is no slight proof of his enterprise and skill that he should have undertaken all his earlier voyages at his own personal risk and outlay, and that the smallness of the sum—amounting to only 2,500 thalers—which had been placed at his disposal in the year 1865 for the exploration of the Tschad Lake Valley, did not deter him from undertaking that most arduous expedition. Yet however much we may admire his indomitable energy, courage, and tact in penetrating almost

single-handed into those dangerous regions, it is much to be regretted that his inadequate pecuniary resources made it impossible for the expedition to collect or purchase natural history specimens, or to undertake any exact astronomical or other scientific determinations. Dr. Rohlf's great merit as an explorer rests upon the signal ability with which he mastered the languages of the various negro and Berber tribes with whom he was brought in contact, and the extraordinary readiness with which he adapted himself to the peculiarities of the natives, and it was by these means that he was enabled to study the character and habits of the Africans in a manner never before attempted by any European. Nothing perhaps more clearly demonstrates the force of his resolution than the fact of his having spent several years under the assumed character of a Mohammedan at Morocco in the study of the natives around him, and it is this intimate acquaintance with the people which imparts its special value to his remarks on the ethnology of the African races.

PALESTINE EXPLORATION FUND.

9 Pall Mall East : Nov. 11, 1874.

THE Ordnance Survey of Palestine, interrupted by the summer, by Lieutenant Conder's visit to England, and by Mr. Tyrwhitt Drake's death, has been resumed. The new camp is at Halhul, site of the ancient town of the same name, a conspicuous hill on the right of the road from Hebron to Jerusalem, and about five miles from the former place. The party will be strengthened in a few days by the arrival of Lieutenant H. H. Kitchener, R.E., and will then consist entirely of Royal Engineers.

On his way to Jerusalem Lieutenant Conder visited Abu Shushah and Tell Gezer—the Gezer discovered by M. Clermont-Ganneau. It was on the top of a flat hill, "rather more than a mile" from Tell Gezer, that the two Gezer stones were found. He observed, as M. Ganneau had already pointed out, evidence of considerable work, the rock being cut in various places, and shallow troughs looking like sarcophagi with the sides knocked off lying about. In the same line as M. Ganneau's two previously found inscriptions he was shown a long rough stone with two large letters about a foot in height cut in the end. Another stone to the south-east of the first was reported, but not seen. One of M. Ganneau's two inscriptions is in the Serai at Jerusalem, the other in the Serai at Ramleh. The vexatious circumstances which led to their being lost to the Palestine Fund belong to M. Ganneau's history of this important find. This portion of the country has already been mapped by the Survey Expedition, but the work was done in the interval between the departure of Captain Stewart and the arrival of Lieutenant Conder, when the field-work was carried on by the two non-commissioned officers—Sergeant Black and Corporal Armstrong—and Mr. Drake's hands were full with the organisation and management of the party, so that the archaeological harvest was small.

Lieutenant Conder has made a discovery of great topographical interest in the Haran area of Jerusalem. On the platform of the Kubbet es Sakhra are two great cisterns, numbered by Major Wilson in the Notes to the Ordnance Survey of Jerusalem as one and three. The former is a tunnel 130 feet long and 24 feet wide, cut in the rock for 18 feet from the bottom to the springing of the arch; it runs north and south. The other runs north-east and south-west; and if their lines of direction were produced they would meet—a fact noticed by Captain Warren in the *Recovery of Jerusalem*—at the northern edge of the platform, where Captain Warren observed a hollow-sounding piece of ground. Lieutenant Conder, descending into the latter cistern with Sergeant Black, found the northern end closed by a wall evidently of more modern construction, and built irregularly in an oblique line across it. The lower part is

cemented, but above the cement the work is visible, and proves to be irregular in size, with broad mortar joints. The passage is roofed with a semicircular arch of fine masonry. The keystone of the work is very narrow, and the voussoirs gradually increase in breadth as they approach the haunches. In this respect the work resembles that of the twin pools by the Convent of the Sisters of Zion. Lieutenant Conder thinks it probably Roman. At the end of the passage the voussoirs are cut irregularly by the wall, and there seems no doubt that the passage continues farther north. An examination of cistern No. 1 showed the same later work, though in this case the cross-wall blocking up the passage was not so easily seen. The voussoirs, however, of the roofing arch run beyond in the same way. Lieutenant Conder thinks that the discovery of an extension of both tunnels goes far to prove a communication with the exterior. There is also, he notices, the side chamber in cistern No. 3 with a well mouth. He conjectures that this may be the House of Baptism, or more properly the bath room mentioned in the Talmud. Captain Warren has already (*Recovery of Jerusalem*, p. 206) suggested the same thing. WALTER BESANT.

THE EXPLORATION OF THE ARCTIC REGIONS.

WE have been requested to publish the following letter:—

"To the President of the Royal Geographical Society.

"SIR,—Ten years ago when Arctic exploration was sought to be revived by the Royal Geographical Society, all, I think, were agreed as to the main points of the subject, while a diversity of opinion arose regarding one point, which appears to me to be only of secondary importance now, namely, the route to be chosen. There was a great deal of discussion upon this point, and whether it would be more advisable for a new English expedition to proceed west of Greenland up Smith Sound, or east of it, anywhere in the wide sea between Greenland and Nowaya Zemlya.

"From the results arrived at by actual exploration since 1865, and the light shed by it upon the subject, it appears to me that a real ground for any such diversity of opinion no more exists, as the most noteworthy fact brought out by the various recent Polar expeditions is a greater navigability in all parts of the Arctic seas than was formerly supposed to exist.

"For my part I readily admit that the Smith Sound route has turned out to be a great deal more practicable and navigable than could formerly be surmised from the experience of Kane and Hayes. Certainly both these attempts were made with insufficient means, Kane's *Advance* being only a sailing-brig, heavily laden, and blown about by unusually strong gales; and Hayes's schooner, the *United States*, a mere sailing vessel of 133 tons, not fit for navigation in the Arctic seas. When therefore Hall, in 1871, tried this route with the *Polaris*, he achieved most astounding results, for he sailed and steamed from Tessusak without interruption in one stretch through the ill-famed Melville Bay, Smith Sound, Kennedy Channel, and into new seas as far as 82° N. latitude, a distance of 700 miles, with the greatest ease in seven days, and even reached beyond the 82nd parallel. Yet his vessel, the *Polaris*, was only a small, weak-powered steamer, by no means well fitted for the work, and manned by a motley crew hampered by Eskimo families and little children.

"While I thus readily admit my expectations to have been far exceeded by recent experience, similar progress has also been made on all the other routes into the central area of the Arctic regions, and a great deal has been achieved, even with small means. From the results already arrived at it is evident that with appropriate steam vessels making use of the experience gained,

that central area will be penetrated as far as the North Pole, or any other point.

"As I cannot but think that an English exploring expedition will soon leave for the Arctic regions, I take this opportunity to state to you explicitly, that I withdraw everything I formerly said that might be construed into a diversity of opinion on the main points at issue, and that I now distinctly approve beforehand of any route or direction that may be decided on for a new expedition by British geographers.

"For those expeditions which I myself have been able to set on foot since 1865, the most direct and shortest routes and the nearest goals seemed the most advisable, as only very small means could be raised, and these chiefly by promising to break new ground and opening new lines of research never before attempted. With the same small means at our command we could not have done as much as we did elsewhere. At my instance, more or less, seven very modest expeditions and summer cruises went forth: the first one, a reconnoitring tour in 1868 under Captain Koldewey, consisted of a little Norwegian sloop of only about sixty tons, no bigger than an ordinary trawling-smack; she was purchased at Bergen, received the name *Germania*, and went towards East Greenland, then to the east of Bear Island, on the north of Spitzbergen, beyond the 81st parallel, and surveyed portions of East Spitzbergen not before reached by English or Swedish expeditions. Next year, 1869, started the so-called second German expedition, consisting of two vessels—a screw steamer of 143 tons called the *Germania*, and a sailing-brig of 242 tons called the *Hansa*, as a tender; they went again to East Greenland, explored this coast as far as 77° N. lat., and discovered a magnificent inlet, Franz Joseph Fjord, extending far into the interior of Greenland, navigable, and the shores of it enlivened by herds of reindeer and musk oxen. It was also shown that the interior of Greenland in this region consists not of a slightly elevated table land, as formerly supposed, but of splendid mountain masses of Alpine character. The account of this expedition, which also wintered on the coast of East Greenland in 74½° N. lat., is before you in an English dress. Besides this, I got my friend Mr. Rosenthal, a shipowner, to allow two scientific men, Dr. Dorst and Dr. Bessels, to accompany two of his whaling steamers, one to explore the seas east of Spitzbergen, the other those east of Greenland; both made highly interesting and valuable scientific observations, which have not yet been published. In 1870, my friends Baron Heuglin and Count Zeil went from Tromsø in a small schooner of thirty tons to East Spitzbergen, and collected most interesting information on a region never before visited by scientific men; and when Baron Heuglin had been out a second time the next following year (1871), again with one of Rosenthal's expeditions, he published a valuable work in three volumes. In the same year Payer and Weyprecht went in the *Isbjörn*, a sailing vessel of forty tons, from Tromsø, to explore still further northward than Bessels the sea east of Spitzbergen, which was done with great success as high up as 78° 43' N. lat. (in 42½° E. long. Gr.), and as far east as 59° E. long. The scientific results of this cruise have also not yet been fully worked out.

"Thus, from the interior of Greenland in 30° W. long. to 59° E. long. east of Spitzbergen, a width of about 90° of longitude has been explored, and highly interesting results obtained. The cost of these seven expeditions and cruises was about 140,000 thalers, or altogether 20,000*l.*, of which only 5,000 thalers, or 750*l.*, were contributed by the Government of Germany, all the rest by private individuals, my friend Rosenthal spending upwards of 30,000 thalers. Half of the results of these expeditions have not yet been published, but the work of the second German expedition in four volumes, and that by Baron Heuglin in

three volumes, are finished, and are, I think, a credit to the explorers.

"I have mentioned these details in order to show that such endeavours to extend human knowledge, improve the spirit of the navy, and foster a taste for the cause of science, are not necessarily expensive. A really effective expedition will cost more, but also accomplish more; in this respect a writer in the *Athenæum*, in reviewing our second expedition, says that 'to start on expeditions such as these in vessels ill-adapted, ill-strengthened, ill-found, and ill-provisioned, is but to court failure,' to which I say Amen.

"One well-appointed English expedition of one or two strong steamers may well be able to penetrate to the furthest point of our globe. Even the whaling ships, now furnished as they are with steam, penetrate as a rule to where it was formerly thought impossible for such a fleet, to pursue their valuable fisheries; the ill-famed middle ice of Baffin's Bay is to them no more impenetrable, and extreme points reached by former discovery expeditions in the course of a long series of years, are now visited and passed by one whaling vessel in the course of a few summer months.

"Up to 1869 the general opinion was that from Bear Island in $74\frac{1}{2}^{\circ}$ N. lat. there extended the line of heavy impenetrable pack ice eastward as far as Nowaya Zemlya; that—working along this coast—the furthest limit of navigation was at Cape Nassau, and that the Kara Sea was entirely and always filled with masses of ice, totally impracticable for any navigation. But the Norwegians, with their frail fishing smacks of only thirty tons on an average, have for five consecutive years every year navigated all those seas hitherto considered as totally impenetrable; they have repeatedly circumnavigated the whole of Nowaya Zemlya, crossed the Kara Sea in every direction, penetrated to the Obi and Yenisei, and shown beyond the shadow of a doubt that navigation can generally be pursued there during five months of the year, from June to October, and, moreover, that the whole of the Kara Sea and the Siberian Sea far to the north are every year more or less cleared of their ice, both by its melting and drifting away to the north. I have had the journals of many of these cruises sent to me from Norway, containing a mass of good observations made at the instance of the Government Meteorological Office, under the superintendence of Professor Mohn, at Christiania. If another proof of confirmation was wanting, it has been furnished by Mr. Wiggins, of Sunderland, who this summer also navigated through the Kara Sea as far as the mouth of Obi.

"As to the sea between Nowaya Zemlya and Spitzbergen, the very first time in our days its navigation was attempted, namely, by Weyprecht and Payer in 1871, it was found navigable even to a small sailing vessel of forty tons up to 79° N. lat., and in the eastern half of it no ice whatever was met with. The experience of their last expedition, in 1872, certainly has been the reverse, as they encountered much and dense ice, at least in the direction of Cape Nassau, but it would lead to erroneous conclusions if it was not taken into account that the Norwegians at the same time found the western half of that sea quite free from ice.

"I am not going to make any remark upon the late Austrian Expedition, as its results and observations are not yet sufficiently before us; but I am authorised by a letter of Lieutenant Weyprecht, the nautical commander, dated November 1, to state that, before he has published his extensive observations, he warns against all premature conclusions, and concludes the letter, which I shall publish in the next part of the *Mittheilungen*, and in which he expresses his own views on the Arctic question for the first time, with the sentence: 'that he considers the route through the Siberian Sea as far as Bering Strait as practicable as before, and would readily take the command of another expedition in the same direction.'

"I believe myself that the navigability of the seas to the north of Nowaya Zemlya can as little be called in question by this one drift of the Austrian Expedition, as the navigability of Baffin Bay by the drifts of De Haven, McClintock, and the crew of the *Polaris*. These drifts by no means prevent others from penetrating the same seas.

"And here I may be allowed to refer in a few words to the other end of this route, the seas north of Bering Strait. Captain Cook, in 1778, and his second in command, Captain Clerke in 1779, thought they had reached the extreme limit of navigation by attaining Icy Cape (in $70\frac{1}{2}^{\circ}$ N. lat.) on the American, and North Cape (in 69° N. lat.) on the Asiatic side, and they considered further attempts there as madness as well as to any practical purpose useless. Captain Beechey, however, with his lieutenant, the present Admiral Sir Edward Belcher, penetrated already in 1826 as far as Point Barrow, and expressed the result of his experience in the weighty sentence: 'I have always been of opinion that a navigation may be performed along any coast of the Polar Sea that is continuous.' And true enough, many a follower has sailed along the whole of the northernmost coast of America, though exposed to the pressure of the immense pack-ice masses from the north impinging upon these coasts. Captain Kellett with the *Herald*, a vessel not intended for ice navigation, penetrated in 1849 with ease to $72^{\circ} 51'$ N. lat. into the Polar Sea so much dreaded by Cook and Clerke, discovered Herald Island, and what is now called by some Wrangel Land, and found the ice not at all so formidable as supposed previously.† Passing over the similar experience of Collinson, McClure, Rodgers and others, we come to the time when the Americans established a highly profitable whale fishery in seas considered entirely useless by Cook and Clerke, gaining as much as eight millions of dollars in two years. It was in one of these years that a shipmaster went as far as 74° N. lat. nearly due north of Herald Island, and saw peaks and mountain ranges far to the northward of his position. Another, Captain Long, went a considerable distance along the Siberian coast to the west, and did more in a few days with a sailing vessel than Admiral Wrangel had been able to accomplish with sledges in winter, in the course of four years, in the same region. In a letter dated Honolulu, January 15, 1868, he says: "That the passage from the Pacific to the Atlantic Ocean will be accomplished by one of the routes I have indicated, I have as much faith in as I have in any uncertain event of the future, and much more than I had fifteen years ago in the success of the Atlantic telegraph. Although this route will be of no great importance to commerce as a transit from one ocean to the other, yet could the passage along the coast as far as the mouth of the Lena be successfully made every year (which I think probable), it would be of great benefit in developing the resources of Northern Siberia.'‡

"To the north-east of Spitzbergen also an interesting cruise was recently made by Mr. Leigh Smith, who in 1871, with only a sailing schooner of 85 tons, reached as far as $27^{\circ} 25'$ E. of Gr. in $80^{\circ} 27'$ N. lat., four degrees of longitude farther than any authenticated and observing navigator before him. At this point he had before him to the east, consequently in the direction of the newly-discovered Franz Joseph Land, nothing but open water on September 6, 1871, as far as the eye could reach.

"That land would be found in the locality where the Austrian Expedition actually found it, I have long predicted. Gillis Land, after Keulen's map generally considered to be situated in 80° N. lat., 30° E. long., by the Swedish explorers erroneously put down in 79° N. lat., I have from the original text concluded to be in $81\frac{1}{2}^{\circ}$ N. lat.

and 37° E. long. Gr. This approaches to within eighty nautical miles of Franz Joseph Land, which was sighted westward as far as 46° E. long, but in this longitude there was not as yet any limit of the land. The flight of immense numbers of brent geese and other birds in the same direction has long been observed by various voyagers, and it has also been noticed that not only migrations of birds, but also of mammals, take the same direction; the Norwegian fishermen on the north of Spitzbergen have repeatedly caught immense numbers of walrus and ice-bears at the Seven Islands, and especially on their north-eastern side, whereas at Spitzbergen the walrus is now very scarce, and the ice-bear almost extinct.

"I consider it also highly probable that that great Arctic pioneer and navigator, William Baffin, may have seen the western shores of Franz Joseph Land as long ago as 1614, for in that year he proceeded to 81° N. lat., and thought he saw land as far as 82° to the north-east of Spitzbergen, which is accordingly marked in one of Purchas' maps.* It is true the account of this voyage is very meagre, and so is the account of his voyage and still greater discovery of Baffin's Bay, two years after, which Sir John Barrow calls 'the most vague, indefinite, and unsatisfactory,' and in his map leaves out Baffin Bay altogether, and this, be it observed, in the year 1818.† Barrington and Beaufoy, though inserting Baffin's discoveries in their map dated March 1, 1818, describe them in the following words:—"Baffin's Bay, according to the relation of W. Baffin in 1616, but not now believed!" With Barents' important voyages and discoveries it is exactly the same. The Russians, who only navigated as far as Cape Nassau, also tried to erase Barents' discoveries from the map, and cut off the north-eastern part of Nowaya Zemlya altogether.‡ But old Barents has been found more trustworthy and correct than all the Russian maps and pilots put together. Even the identical winter hut of that great Dutch navigator, nearly 300 years old, was found by the Norwegian Captain Carlsen on September 9, 1871, and many interesting relics brought home by him, so that the truth and correctness of those famous old Dutch voyages has been proved beyond all doubt. In like manner, Baffin's voyage to within sight of the western shores of Franz Joseph Land may be considered trustworthy until some substantial proof of the contrary is brought forward. Nay, it even appears to me that the report given of another remarkable voyage of a Dutch navigator, Cornelis Roule, merits attention, and is to be considered in the same way as Baffin's and Barents', so that if it be as true as the voyages of these navigators, it may yet be found that Franz Joseph Land was already discovered, and sailed through up to $74\frac{1}{2}^{\circ}$ or 75° N. lat. nearly 300 years ago. This report runs thus: "I am informed with certainty that Captain Cornelis Roule has been in $84\frac{1}{2}^{\circ}$ or 85° N. lat. in the longitude of Nowaya Zemlya, and has sailed about 40 miles between broken land, seeing large open water behind it. He went on shore with his boat, and, from a hill, it appeared to him that he could go three days more to the north. He found lots of birds there, and very tame.§ Now the mean longitude of Nowaya Zemlya is 60° E. Gr., and passes right through Austria Sound and Franz Joseph Land; the latter is a 'broken land' also,

* Barrington and Beaufoy, pp. 40, 41.

† Barrow, *Chronological History*, p. 216 and map.

‡ This was actually attempted by a pilot of the "Russian Imperial Marine," and found its way also into vol. viii. of the *Journal of the Royal Geographical Society*, p. 411, where the map is spoken of as "showing the actual outline of its coasts, as traced by the pilot Ziwoika, from the latest examinations, by which it will be seen that more than the eastern half represented on our maps has no existence in reality!"

behind which Lieutenant Payer saw 'large open water' and found 'lots of birds!'

"Be this as it may, we now come to Sir Edward Parry's voyage north of Spitzbergen, regarding which it is an undoubted fact that he reached 82° 45' N. lat., the furthest well authenticated point yet reached by any navigator, and a feat unsurpassed to this day."

"There is, however, no doubt that the northern coast of Spitzbergen lies just in the teeth of one of the most formidable ice-currents, and one, that summer and winter, is sweeping its ice-masses directly towards these coasts. If, therefore, an English expedition should take Spitzbergen as a base to start from, it would require two vessels, one of which ought to go up the west coast, the other up the east coast; for when northerly and westerly winds prevail, the first vessel would probably be hampered by ice, and the second vessel find it navigable up the east coast, and if easterly and southerly winds prevailed, the reverse would be the case."

"It is by way of Smith Sound, however, that navigation has hitherto been pushed furthest, and here an English expedition, so long projected, may well operate. At the same time the east coast of Greenland seems still worthy of attention. The second German expedition did not proceed far to the North, it is true, but it was easy enough to reach the coast, and Lieutenant Payer told me, this was merely something like a 'cab's drive.' Captain Gray, of Peterhead, a most experienced Arctic navigator, wrote already in 1868, thus: 'Having for many years pursued the whale fishery on the East coast of Greenland, and observed the tides, the set of currents, and the state of the ice in that locality at various seasons of the year, I think that little, if any, difficulty would be experienced in carrying a vessel in a single season to a very high latitude, if not to the Pole itself, by taking the ice at about the latitude of 75°, where generally exists a deep bight, sometimes running in a north-west direction upwards of 100 miles towards Shannon Island, from thence following the continent of Greenland as long as it was found to trend in the desired direction, and afterwards pushing northwards through the loose fields of ice, which I shall show may be expected to be found in that locality. The following are the reasons on which that opinion is founded: In prosecuting the whale fishery in the vicinity of Shannon Island, there are generally found loose fields of ice, with a considerable amount of open water, and a dark water-sky along the land to the northward; the land-water sometimes extending for at least fifty miles to the eastward; and, in seasons when south-west winds prevail, the ice opens up very fast from the land in that latitude. The ice on the east coast of Greenland is what is termed field or floe ice, the extent of which varies with the nature of the season, but it is always in motion, even in winter, as is proved by the fact that ships beset as far north as 78° have driven down during the autumn and winter as far south as Cape Farewell. Thus there is always the means of pushing to the northward, by keeping to the land ice and watching favourable openings.'

"And quite recently, in communicating the result of his experience in the present year, he writes:—'During the past season I had too many opportunities of observing the drift of the ice. In May, June, July and August its average drift was fully fourteen miles a day, in March and April it must have been driving double that rate. I calculate that nearly the whole of the ice was driven out of the Arctic Basin last summer. I went north to 79° 45' in August and found the ice all broken up, whereas down in 77° the floes were lying whole in the sea, clearly showing that the ice in 80° must have been broken up by a swell from the north; beyond the pack to the north, which I could see

over, there was a dark water sky reaching north until lost in the distance without a particle of ice to be seen in it. I was convinced at the time, and so was my brother, that we could have gone up to the Pole, or at any rate far beyond where anyone had ever been before. I bitterly repent that I did not sacrifice my chance of finding whale, and make the attempt, although my coals and provisions were wearing down. Although I have never advocated an attempt being made to reach the Pole by Spitzbergen, knowing well the difficulties that would have to be encountered, my ideas are now changed from what I saw last voyage. I am now convinced that a great advance towards the Pole could occasionally be made without much trouble or risk by Spitzbergen, and some of our amateur navigators will be sure to do it and pluck the honour from the Royal Navy. I do not know if the *Eclipse* will be sent to the Greenland whale fishery next year; if I go I shall be able to satisfy myself more thoroughly as to the clearing out of the ice this year, because it will necessarily be of a much lighter character than usual."

"If this important information should be considered worthy the attention of the British geographers and the Admiralty, there would, perhaps, be two steamers sent out to make success doubly certain, one to proceed up the west coast of Greenland by way of Smith Sound, the other up the east coast of Greenland."

"But whatever may be decided on, I trust that the British Government will no longer hold back from granting what all geographers and all the scientific corporations of England have been begging for these ten long years, and afford the means for a new effective expedition to crown these our modest endeavours, of which I have given an outline. We in Germany and Austria have done our duty, and I am happy to have lived to see that our humble endeavours, the work of our Arctic explorers, have gained your approbation, that of the Royal Geographical Society of Great Britain. We have done all we could in the private manner we had to do it, for as a nation we Germans are only now beginning to turn our attention to nautical matters. We have had no vessels, no means, and our Government has had to fight three great wars in the last ten years. But, nevertheless, we have had in this interval German, Austrian, American, Swedish, Norwegian, and Russian Polar Expeditions, in which even an Italian officer took part at the instance of the Italian Government. And England, formerly always taking the lead in these matters, is almost the only maritime power that has kept aloof. When nearly thirty years ago one man of science proposed that magnetical observations should be extended, it was at once answered by the Government then by sending out to the Antarctic regions an expedition of two vessels, the *Erebus* and *Terror*, under that great navigator Sir James Clarke Ross, which has never yet been eclipsed as to the importance of its results and the lustre it shed on the British Navy. I do not know the views held in England now, but I know that to us outsiders the achievements and work of a man like Sir James Clarke Ross or Livingstone have done more for the prestige of Great Britain than a march to Cumassi, that cost nine millions of pounds sterling. That great explorer, Livingstone, is no more, his work is going to be continued and finished by German and American explorers; we shall also certainly not let the Arctic work rest till it is fully accomplished, but it surely behoves Great Britain now to step in and once more to take the lead."

"I have the honour to be, Sir, your very obedient humble servant,

"AUGUSTUS PETERMANN,
Honorary Corresponding Member and Gold Medallist
of the Royal Geographical Society.

"Gotha, November 7, 1874."

MR. OLIVER MADOX-BROWN.

WE regret to announce the death of Mr. Oliver Madox-Brown, author of the novel of *Gabriel Denver*. He died on November 5, of pyæmia, after an illness of about two months. *Gabriel Denver*, a one-volume novel, appeared, as our readers may remember, towards the end of 1873; and it must, without the least exaggeration, be called one of the most remarkable books ever produced by an extremely young author. Mr. Oliver Madox-Brown, son of the distinguished historical painter, was born on January 20, 1855; he was therefore only eighteen years of age when his romance was published (by Messrs. Smith and Elder), and the main work of its composition had been done when he was barely seventeen. The story is one of colonial life and naval disaster, and in especial of overmastering passion; the personages and incidents are few, but the tragic intensity with which they are invested is of unusual depth. We understand that the author had begun various other stories, but probably none of them had approached completion. His precocity as a writer was even exceeded by that which he had displayed as a painter; and it is difficult to say in which line of art he showed the higher gift. His exhibited pictures were the following. In 1869, in the Dudley Gallery, *Chiron receiving the Infant Jason from the Slave*, water-colour; 1870, same gallery, *Obstinacy* (a horse being driven into the sea), water-colour; Royal Academy, *Exercise* (a horse ridden along the seashore), water-colour; 1871, International Exhibition, *Prospero and the Infant Miranda* (cast adrift in the boat), water-colour; New British Institution, *Mazeppa*, oil-colour; 1872, Society of French Artists, Bond Street, *Silas Marner* (discovering the mother dead in the snow), water-colour. The design of *Mazeppa*, and one which the artist executed from the drama of *The Deformed Transformed*, were engraved in an edition of Byron's *Poems*, *Moron's Popular Poets*, 1870. All these paintings, though showing some degree of technical incompleteness proportionate to the age at which they were produced, are (and this is the lowest that can be said of them) entirely removed, by original conception and by their colour, from the range of commonplace work. The youth of less than twenty years of whom such a record remains was born not wholly to die. EDITOR.

CORRESPONDENCE.

MADAME PATTI AT LIVERPOOL.

Liverpool: Nov. 10, 1874.

It having been announced in a French newspaper that Mdme. Patti received the public congratulations of the Duke of Edinburgh on the occasion of her singing at the Liverpool festival, and that she was complimented by a torch-light procession, both purely imaginary occurrences, it may interest some of your readers to know some of the real facts of her visit to Liverpool, which may perhaps account for the above reports.

Mdme. Patti was engaged for 800*l.* to sing upon two nights, three songs being set down for each night. On the day she was to arrive, a member of the festival committee received a telegram announcing the time of her arrival, and requesting that a grand reception might be prepared for her. Requests were addressed to the committee and to the mayor to present bouquets to Mdme. Patti, but in neither case was it thought necessary to comply with the request, although in one case at least the bouquets were provided. A hall in the neighbourhood of the Philharmonic was placarded over with "Welcome Adelina Patti," not by the committee, but the hall was in the occupation of the gentleman who was understood to act as her agent here. These facts may all admit of explanation, as may the bouquets handed up by her supposed agent, but what requires explanation still more is the comparative trash which Mdme. Patti received 800*l.* to sing. The waltz by Visetti (I think that is the name) was bad enough, but to insult the audience of an important musical festival by making "Within a mile of Edinburgh town" the occasion of one of the three appearances of an evening for which 400*l.* was exacted out of the fund raised for the charities, betokened a disregard of art which will not make a Liverpool audience anxious to renew acquaintance with this lady, especially as Mesdames Titiens and Trebelli Bettini have accustomed them to expect from artists a sincere respect for their art and for their audience. Mdme. Albani, on the other hand, made a most favourable impression upon our very unimpressible public, both by the *timbre* of her voice and by her exquisite taste and feeling, and she will be very warmly welcomed here again if we are able to tempt her hither.

The spirited action of M. Faure, at Paris, in vindication of the dignity of real art, has been cordially applauded here, and our only regret is that more resentment is not expressed by those true artists whose character and interests suffer by being mixed up with objectionable puffery.

P. H. RATHBONE.

"SHEKEL ISRAEL."

Nash Mills, Hemel Hempstead: Nov. 7, 1874.

I have to thank Mr. Conder for the information given in his letter in the *ACADEMY* of the 31st ult., as to "the small silver coin weighing sixty-three grains, and bearing the legend *Shekel Israel*," about which I enquired in my last letter.

I have now, through the kind courtesy of Canon Tristram, had an opportunity of examining the original of Mr. Conder's woodcut in his *Child's History of Jerusalem*, and find, as I had been led to anticipate, that his account of it is erroneous, both as regards the weight and the legend. The actual weight is 45 grains, not 63; but as the coin is pierced by a large hole, and is moreover a modern counterfeit, the question of weight is of no importance. But though in this respect unlike Mr. Tyrwhitt Drake's shekels, the piece is of considerable interest as having been cast from a genuine original, of which, so far as I am aware, no other example has been hitherto engraved, though nearly the same type has been described by Mr. Reichardt.

The obverse is similar to Madden's No. 4, p. 168; and the reverse is like Madden's No. 5, p. 206, except in the legend, which is *שֶׁקֶל יִשְׂרָאֵל*, the *לֶרֶךְ* being a blunder for *לְחָר*, itself an abbreviation of *לְחָרֹת*. This legend, according to the usual interpretation, is "The second year of the deliverance of Israel," though no doubt Mr. Conder would interpret it otherwise. I need not, however, dispute this point, but will now explain how Mr. Conder's misreading of the legend has arisen.

The letters *לֶרֶךְ* which are below the broad end of the trumpets on the coin, appear to have been almost obliterated on the original, and are in consequence almost imperceptible on the casting. The other and plainer letters remaining are, therefore, *שֶׁקֶל יִשְׂרָאֵל*, which Mr. Conder, by substituting a *ק* for the *ב*, has been able to convert into the entirely unexpected and inappropriate legend for a coin of this size, "*שֶׁקֶל יִשְׂרָאֵל*." *Shekel Israel*. I am sorry again to trespass upon your space, but it seems desirable that no time should be lost in correcting this erroneous reading, on which equally erroneous arguments have been so confidently based.

JOHN EVANS.

[We cannot insert any further correspondence on this subject.—ED.]

SERVIUS: A LOST COMMENTARY ON TERENCE.

17 Bedford Street, Covent Garden, W.C.

It is, I believe, not generally known that Servius wrote a commentary on Terence, which has never been printed, although it was extant in MS. as late as the middle of the sixteenth century, and was known to Paul Manutius and to Muretus, the latter of whom refers to it, as well as to a spurious work which had passed under the name of Servius for some years before, in the following manner:—

... "non ille quidem eminentis Servius ejus vulgo ineptiae quaedam in Terentium circumferuntur, sed vetus ille Servius ejus in Terentium Commentarius nusquam adhuc excusus magno studiosorum bono propediem editurus est Manutius."

This was written in 1554, and doubtless the "ineptiae" to which he refers are among the notes to the editions of 1504, 1512, 1515, 1518, and 1543, all of which profess to contain commentaries by Servius and others, but it does not appear that Manutius ever carried out his project of printing the genuine commentary (although at least four editions of Terence were published by him after the year 1554), which it seems not unreasonable to suppose may still be resting—possibly the very MS. which was once in the hands of Manutius—in some one of the libraries of Italy or elsewhere, and may yet once more "magno studiosorum bono" be brought to light. There is a manuscript in the Public Library at Basle, "*Ex Servii Commentariis in Opera Terentii et Virgilii*

collectanea" (see Haenel's Catalogue, Leipzig, 1830), the title of which, although it proves nothing, is at least suggestive of the probability of genuineness; I should like to know whether any one has ever taken the trouble to examine this MS., and compare its contents with the notes in the editions I have mentioned, which have never, so far as I know, been reprinted since Muretus denounced them as spurious.

FRED. NORGATE.

SHAKSPERE NOT THE PART-AUTHOR OF BEN JONSON'S SEJANUS.

15 Russell Square, Brighton.

In his preface to *Sejanus*, Jonson says:—

"Lastly I would informe you, that this Booke in all nūbers, is not the same with that which was acted on the publike Stage, wherein a second Pen had good share: in place of which I haue rather chosen, to put weaker (and no doubt lesse pleasing) of mine own, then to defraud so happy a *Genius* of his right, by my lothed usurpation" (ed. 1605).

This second pen, according to Capell, Whalley and others, was that of Shakspeare, their reasons being, it is to be supposed, the words "so happy a *Genius*"—Jonson's "weaker and less pleasing verse"—and the fact that *Sejanus* was played by the company of which Shakspeare was a member. Yet it was but natural that Jonson should offer his tragedy to Richard Burbage, and those whom Hamlet calls *par excellence* "the tragedians of the city." The more natural inasmuch as it was with Henslowe and his company that he had chiefly quarrelled. As to Shakspeare personally, he it was, who beyond Satiro-Mastix and all others, had put Jonson down. And while he is to us the happy dramatic genius of his age, yet each writer in those days knew many happy geniuses among his contemporary writers or patrons, so long at least as they were his friends or patrons. The author I am to quote dedicates a little romance—"Candido et Cordato Amico, foelici Genio, perspicaci Ingenio, Johan Mane De (—) Baronetto." In neither instance is it necessary, or perhaps right, to take genius in the sense in which we now sometimes over-distinguish it from talent. Rather the phrase is to be glossed as happy spirit, or powers or faculties, or even happy natural bent. Take it how you will, it was an age when everyone paid exaggerated compliments to anybody, and Jonson was never wanting in words of sarcasm, lavish praise, or flattery. Besides, the circumstances are not to be forgotten; in less complimentary times more than a mere yea and nay speech would be indulged in and looked for when a man's "good share" of a tragedy was to be ruthlessly cut out. The lesser the man, the greater the disappointment and need of soothing it; and the much lesser man who claims the joint-authorship was very vain, and his happy day-dream, that he would go down to posterity as parcel-author of *Sejanus*, broken. To readers of Jonson—"weaker and no doubt less pleasing"—are insincere flatterings and mock-modest words. Any "loathed usurpation" could have been avoided by the simple expedient of a second name on the title-page, and Shakspeare's least needed, and was the least likely, to be set aside. For my own part, the whole clause has never seemed to me other than a hollow phrasing, within which one could distinctly read Jonson's intent to be sole author of *Sejanus*.

That the assister was "undoubtedly Shakspeare" is rightly ridiculed by Gifford, who suggests Geo. Chapman, Jonson's friend, or Middleton, or, as most likely of all, Fletcher. These names, however, merely show that conjectures based on such general words are guesses with unknown odds against them. In 1646 Samuel Sheppard published a pamphlet-book, *The Times Displayed in Six Sestiyads*. The first five are against sectaries; the sixth against the mechanic-wits of the day, is so by being a series of verses in praise of the greater and generally older poets, Daniel, Drayton,

Shakspeare, Jonson, and others. The eleventh encomium—given as printed—runs thus:—

11.

"So His* that Divine PLAUTUS equalled,
Whose Commick vain MENANDER nere could hit,
Whose tragick sceans shal be with wonder Read
By after ages for unto his wit
My selfe gave personal ayd I dictated
To him when as *Sejanus* fall he writ,
And yet on earth some foolish sots there bee
That dare make Randolf his Rival in degree."

Haslewood printed the sixth Sestiad in the *British Bibliographer*, and J. M. it and extracts from the rest in the *Gentleman's Magazine* (New Ser. vol. 27), but neither appears to have noticed these expressions. The Rev. Joseph Hunter in his MS. *Chorus Vatum Angl.*, hastily says:—"It appears from these extracts [*Gent. Mag.*] that Sheppard acted as a kind of amanuensis to Ben Jonson." But no kind of amanuensis gives personal aid to a poet's wit and dictates to him as he writes; statesmen and authors dictate their self-chosen words to whoever may be acting as amanuensis. As Sheppard is not a master of English verse or style, so his "dictate" is not happily chosen, but the meaning and intent of it and its context are clear. Read by the light of Jonson's words, they are not only clear but distinct, and we see Sheppard's disappointment, and the strugglings of his self-conceit to record the fact that he had been a part-author in *Sejanus*—strugglings which are shown in his "And yet," and "for," and which destroy his encomium by making it ridiculous. His other encomia here and elsewhere are generally very passable verse—some may merit higher praise—and his epigrams are not less readable than the most of that age.

Here this note might end, were there not a prejudice against disconnecting Shakspeare's name from anything to which it has been for any time, though only guessingly, attached. Some facts and considerations therefore may be added which connect themselves with and strengthen Sheppard's statement. It goes to prove his friendship that in the small space of his poems he mentions Jonson's name twice, mentions it with praise twice, and has six sets of verses in honour of him or his writings. One may be given as some set-off to that already quoted.

* *Linus*. Yes, Coridon, Ile tell thee then
Not long ago liv'd learned Ben,
Ho whose songs they say outvie
All Greek and Latine Poesie,
Who chanted on his pipe Divino,
The overthrow of Catiline,
Both Kings and Princesses of might
To heare his Layes did take delight;
The *Arcadian* Shepherds wonder[d] all
To hear him sing *Sejanus* fall:
O thou renowned shephard, we
Shall n'ere have one again like thee.
With him contemporary then
(As Naso and fam'd Maro when
Our sole Redeemer took his birth)
Shakspeare trod on *English* earth;
His Muse doth merit more reward
Then all the *Greek* or *Latine* Bards."
&c. &c. (Third Pastoril.)

Shakspeare is mentioned once, with praise once, and is praised in three sets of verses. Thus Jonson is mentioned ten times, and Shakspeare five; the other poets once or twice. Again, some of the prose before Sheppard's verse shows a pedantry and perhaps ostentation of learning, yet not that of one making the most of slender knowledge. Some of his epigrams are in Latin, and some of the commendatory verses by his friends—though it must be said, all are wonderfully eulogistic—speak of his learning. This learning would be a recommendation to Jonson, and one requisite for the assister in *Sejanus*, since, as Gifford says, "the author values himself on the closeness with which he has followed the Greek and Latin historians." In his

character also he might at that time have suited surly Ben more than many. Jonson had left comedy and the world, and in splenic retirement given himself for nearly three years to tragedy and *Sejanus*; and Sheppard, in his references to himself, tells us he was a cynic by disposition, a stoic more than a humourist, and born in the hour of Saturn, and when Scorpio was in ascent.

There may, too, have been another bond of union. Sheppard writes of and to gentlemen, esquires, and baronets as their friend and equal, and some of the commendatory verses are by gentlemen as to an equal. Mr. John Clapham is his honoured uncle, and Christopher Clapham, Esq., a relation. His father was Harman Sheppard, M.D., a physician in high repute, who, at the age of ninety, died in 1630; and his mother, Petronilla (Clapham) died in 1650. A strong royalist, he was imprisoned for writing *Mercurius Elencticus*, and elsewhere says he had lost all his books. In 1651, when he tells of these things, he also and for the first time speaks strongly of his poverty—due, it would seem, to his royalism, and perhaps also to the deaths of his parents. Some of his verses were evidently written long before he published them. If he were the author of *The Honest Lawyer*, by S. S., in 1616, this would rather confirm our argument, for there is neither dedication nor address to the reader, and the author in the epilogue speaks of making it a book. Otherwise he does not seem to have published till 1646, and it may therefore be supposed that he then published to supply his wants as well as vent his royalism, and that previously he had means sufficient. His education, parentage, relationship, and associations unite in agreement with this last supposition. Not improbably, therefore, he was not merely Jonson's friend, but a helping patron. If so, it can be the better understood how Jonson, who had nothing but his then idle pen, his books, and the gifts of friends and patrons, could not well refuse the proffered assistance of one whom his writings show to have been egregiously vain and self-conceited.

BRINSLEY NICHOLSON.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Nov. 14.	3 p.m.	Crystal Palace Saturday Concert; Ruff's <i>Lenore</i> Symphony.
"	"	Saturday Popular Concert, St. James Hall (Billow, Sainton).
MONDAY, Nov. 16.	1 p.m.	Sale at Christie's of the Collection of Works of Art of the late E. W. Johnson, Esq.
"	3 p.m.	Asiatic.
"	7 p.m.	Entomological.
"	8 p.m.	Monday Popular Concert, St. James's Hall (Billow, Straus).
TUESDAY, Nov. 17.	7.45 p.m.	Statistical: President's Opening Address.
"	8 p.m.	Civil Engineers: Discussion on "the Nágpur Waterworks."
"	8.30 p.m.	Zoological.
WEDNESDAY, Nov. 18.	"	Sale by Messrs. F. Müller and E. F. Brill, at Amsterdam, of the Collection of Portraits of the late Dr. Bodel-Nyenhuis, of Leiden.
"	7 p.m.	Meteorological.
"	8 p.m.	Geological.
"	"	Society of Arts: Opening Address by Major-General F. Eardley-Wilmot.
THURSDAY, Nov. 19.	8 p.m.	Chemical: Papers by G. H. Beckett and Dr. C. R. A. Wright; W. K. Clifford; W. H. Perkins; Dr. Steinhause; and A. H. Church.
"	"	Linnean.
"	8.30 p.m.	Royal: Rev. S. Haughton on "the Tides of the Arctic Seas," IV.; Mr. A. J. Ellis on "Musical Duodenies."
FRIDAY, Nov. 20.	7.30 p.m.	Sacred Harmonic Society, Exeter Hall (<i>Eljah</i>).
"	8 p.m.	Philological: Mr. C. B. Cayley on "Certain Italian Diminutives."

SCIENCE.

Pharmacographia: a History of the Principal Drugs of Vegetable Origin met with in Great Britain and British India. By Friedrich A. Flückiger, Phil. Dr., Professor in the University of Strasbourg; and Daniel Hanbury, F.R.S., Fellow of the Linnean and Chemical Societies of London. (London: Macmillan & Co., 1874.)

This scholarly work will give a timely impulse to the growing general interest in drugs. The close study which has been given to them through so many centuries, and which at first sight would seem to have resulted only in the piling up of encyclopaedia on encyclopaedia of useless knowledge, is now found to throw the most important light on the history of commerce, and indeed to supply some of the most certain information which we possess of the earliest migrations of mankind. Although neither Professor Flückiger nor Mr. Hanbury has ever published a book before, both of them have been eminent for years as the authors of innumerable monographs of the highest excellence and importance on the more remarkable and interesting drugs of the European pharmacopoeias, contributed by them to the leading scientific societies and periodicals of Europe and America. The Royal Society's Catalogue of Scientific Papers gives a list of their chief labours up to 1863. Since that date Professor Flückiger has brought out his monographs on Camphor, and Musk, and Copaiba, and Buchu, and the Bdellium of Senegal, and the "Inventoire d'une Pharmacie de Dijon en 1439," all in the *Schweizerische Wochenschrift für Pharmacie* (1867-69). While Flückiger lived at Bern he contributed his articles chiefly to the *Wochenschrift*, but many others have appeared in several journals, English, French, German, and American, and particularly after his removal to Strasbourg.

Hanbury's principal literary labours since 1863 have been his papers on Savanilla Rhattany (1865), Burgundy Pitch (1868), Manna (1870), in the *Pharmaceutical Journal*; "On a Species of Ipomoea affording Tampico Jalap" (1871), and "Historical Notes on Galanga" (1873), both in the *Linnean Society's Journal*; on Madagascar Cardamoms (1872), African Ammoniacum (1873), and Pareira Brava (1874), in the *Pharmaceutical Journal*; "Sulla Manna di Calabria," in the *Giornale Botanico Italiano* of 1872; and "On the Botanical Origin and Country of Myrrh," in *Ocean Highways* for 1873. The high reputation which these occasional papers have slowly but surely won for their authors will be confirmed and widely extended by the present publication. They describe it as a record of personal researches, connected together into a handbook of the drugs obtained from the vegetable kingdom. They have in the *Pharmacographia*, in fact, collected together and rearranged their original papers into a systematic treatise on the vegetable Materia Medica of the *British Pharmacopoeia* and *Pharmacopoeia of India*. Their strongest points are the critical botany and commercial history and chemistry of drugs. Pharmacy proper and Therapeutics they omit altogether from their programme; and for general use it would per-

* Ben Johnston [in margin].

haps have been just as well to have omitted chemistry also, although that would have been to give up some of the most excellent and useful original research of the work. But the chemistry of drugs is a strictly professional subject, whereas the really distinctive characteristic of this volume is its exhaustive and thorough treatment of the botany and history of drugs. It is the first work on its subject published in England fitted for the use of non-professional readers, and on which scholars engaged on historical enquiries may implicitly rely. It is almost impossible to select any quotations from such a work, or even to single out any particular article for greater praise than the rest. In fact, in carefully reading through the principal sections, it is the exceptions to statements made by the authors which accumulate on the note paper. The articles on Chinchona Bark (p. 302-331), Atar of Roses (233-235), Aloes (616-618), Areca (607), Saffron (602), Bergamot (109), Orange and Neroli (112-113), Manna (366-374), Frankincense and Myrrh (120-129), and Rhubarb (442-451), may all be named as containing historical information of more or less novelty. The article on Chinchona is perhaps the best of all in the book, and the admirable Bibliography of the subject which is included reminds one how much a Bibliography of all the drugs of the *Materia Medica* treated of by Professor Flückiger and Mr. Hanbury would have enhanced the value of their work.

As to exceptions:—Under the head of Wood Oil, the authors have not included the *Dipterocarpus tuberculatus* of Burmah as one of its sources. They refer Gamboge to *Garcinia Morella*, without discussion; but does not Dr. Hooker refer Siam Gamboge to *G. Griffithii*? Hebbakhade (129) is given as a synonym of Baissa Bol, but it is a synonym of Mango gum resin also. It is probably true that Manilla Elemi is not derived from *Canarium strictum*; but it is most doubtful whether the Elemi of Dioscorides and Pliny was derived from my *Boswellia Frereana*. The Eubaemon of Pliny is the substance which Dioscorides describes (l. i. ch. cxli.) as a poison. And why if Elemi and Frankincense are retained among Professor Flückiger and Hanbury's *Materia Medica*, are Bdellium and Googol omitted? Why is it that *Pistacia Cabulica* is cited under Mastic (145) and Chian Turpentine (146)? If it is a form of *P. Terebinthus*, and is admitted to yield a portion of Sindh Mastic, why is it also included as a source of Chian Turpentine? Hog Gum is mentioned as an adulteration of Gum Tragacanth, but nothing is said of the large quantity of *Kuteera* gum which is produced in India, and has certainly found its way into the drug and spice market of London. If not the root of *Abrus precatorius*, what is Bombay Liquorice? In 1856-57 I found the true Liquorice plant deeply fringing the banks of the Euphrates for miles about Mohamra. The 78th Highlanders found it out instinctively at once on landing after the bombardment, and no doubt but it finds its way down to Bombay in the Arab bugalows. In my *Bombay Products*, which was before the authors of the *Pharmacographia*, I give the *Shat-el-Arab* as a habitat of the true

Liquoritia officinalis. Under *Acacia arabica* no mention is made of *Acacia Catechu*, which contributes the clearer portion of much of the Gum Arabic which comes from the East. *Catechu* is stated to be derived from *A. Catechu* and *A. Suma*. It is well known to be derived also from *A. Sundia*, and if it is identical with *A. Suma*—this should have been so stated. The authors give *Melaleuca leucodendron* as the source of Cajeput oil, of which *M. minor* is a variety. Miguel (*Flora Batav.*) recognises three *Melaleuca* in Amboyna, etc.—*M. leucodendron*, *M. Cajeputi*, and *M. minor*. In Pareira (fourth edition) *M. minor* is given with *M. Cajeputi* as a synonym as the source of the oil. But in the *Pharmacopoeia of India*, *M. minor*, with *M. leucodendron* as a synonym. All this is very confusing, and Professor Flückiger and Mr. Hanbury have not attempted to clear up the confusion. Indian Caraways are not mentioned by the authors, and yet immense quantities of them are consumed. The different forms of *Assafoetida* are by no means sufficiently indicated. The very common Indian form which is like ferruginous earth, is not so much as alluded to. It would not have required more than a line when writing of Gambir to have mentioned that in addition to the common Gambir in cubes one inch square, it is sometimes found in cubes half an inch square, sometimes in square cakes two inches long. Sometimes, also, it is found in round lozenges, very pale, and called White Gambir, and sometimes, as in Bombay, in mass. If Gaub fruit (360), *Fructus Diospyri*, is inserted, why have *Peganum Hormala* and *Nigella sativa* been excluded from the *Pharmacographia*? And why should the authors be compelled to go to Colonel Drury as their authority for the statement that the fibres of *Calotropis gigantea* can be used for weaving, when any time for years past they might have seen fine muslin made therefrom in the India Museum—that is, if they had a balloon to get up to it. Indian Chillies are referred to *Capsicum castigatum*, but are really produced by a vast number of so-called species. Under the head of Rhubarb no mention is made of Himalayan Rhubarb, although it is stated that *Rheum Emodi* is now grown in Silesia. Among the substitutes of Euphorbium, no mention is made of the *Farfeyan* or *Farfaryun* of the Bombay and other Indian bazaars. It is very unlikely that it is true Euphorbium, nothing being more common in India than to find the names of drugs renowned amongst the Greeks and Romans, given to the commonest products of the jungles and bazaars. Thus *Fitarasulioon* [πετροσελινον] is not parsley, but the fruit of *Frangos pabularia*; and the names *Iskulikundrion* [σκολοκίνδριον], *Doonditorus* [δρονδπιρις], *Bitarus* (ππίρις), *Bulookunboon* (πολυπόδιον), *Buloolingen* (πολύτριχον), &c., are found to be given in different bazaars to utterly different drugs. The name is everything in Therapeutics everywhere. Under Galls, no mention is made of the *Kakrasingee* galls of Northern India, nor of the galls of *Terminalia* known in Southern India as *Kadukai-poo*, and which are commonly called *Pistacia* galls. Under Turpentine, Indian or Burmese Turpentine is wholly omitted, al-

though it is fully equal to American, which is included, and this in a book professing to include the *Materia Medica* of India. *Vanilla* is described as if there was only one species which yielded it. Had the authors enquired of the chocolate manufacturers, they would have largely added to our knowledge of the species and vast range of form and size and structure and aroma of the *Vanillas*, and have added Puchurim beans to the paragraph devoted to its substitutes.

In a future edition of the *Pharmacographia* it is to be hoped that the authors will include the more celebrated of the obsolete drugs now omitted—such as Radix Behen, Bdellium, Tacamahaca, Ginseng, Jatamansi (Spikenard), Moosli, Mochurrus, Balanites, and others—which if of less medicinal value—a question after all of fashion chiefly—than some of those now described, are most important in connexion with the literature of the *Materia Medica*. Indeed, a special edition of the work might be published for the use of scholars, and omitting everything but the History and Botany and Commerce of Drugs.

GEORGE BIRDWOOD.

Essai sur la Langue ayaou. Le Dialecte des Falachas. Par J. Halévy. (Paris: Maisonneuve et Cie., 1873.)

Etudes de Grammaire comparée: le thème x dans les Langues de Sem et de Cham. Par l'Abbé Annessi. (Maisonneuve, 1873.)

THERE is no country in the world which has more largely occupied public attention for some time past than Africa. It is here that Darwinians would fain think that traces of "the missing link" may yet be found; and African discovery is one of the most popular subjects of our own age and our own country. Speke, Baker, Livingstone, and others have long kept the newspapers and the Royal Geographical Society constantly employed. It is in Africa, too, that the scene of our two latest wars had been laid; and the Ashantis seem to have proved no less attractive than were the subjects of King Theodore.

It is with the latter that M. Halévy's monograph is concerned. Abyssinia has been interesting to Europeans from the days of Queen Candace to our own, but our knowledge of the multitudinous tribes that inhabit it is still but scanty. In default of physiological information, we can classify them only by their dialects: and even in this respect our lights are few and far from clear. First and foremost come the modern dialects derived from the ancient Gheez or Aethiopic, a Semitic language akin to the so-called Himyaritic of Southern Arabia. The Gheez or "Free Emigrants" originally inhabited Axum in the north; but after their conquest of the native tribes in the south, whom they called Cushites and Aethiopians, and the introduction of Christianity, they and their language took the name of Aethiopic. Aethiopic became extinct in the fourteenth century, but left behind it a considerable ecclesiastical literature, notably a translation of the Book of Enoch, which is quoted in St. Jude's Epistle, and after having been lost for many centuries was re-discovered in its Aethiopic dress by Bruce. The chief dialects sprung from the Gheez are three in number,—the Tigre, or

that of "the subjects," the *Tigrīna*, and the *Amharic* or *Amarīna*, as it is written by M. Antoine d'Abbadie, the greatest living authority upon Abyssinia and its languages.

Besides these, there are numerous idioms which belong to the aboriginal inhabitants of the country. These seem to be all varieties of the Agaou, and the whole family of languages is called Kam by M. d'Abbadie. One of them is spoken by the Falashas, the name given to the Jews in Abyssinia; and it is a singular instance of the cosmopolitan character of the Jewish race, and their readiness to adopt and imitate the external culture of other peoples, that they should not only have forgotten their own tongue and borrowed the language of the natives of Africa, but should have even formed a peculiar dialect out of it for themselves. We find something similar among the Austrian Jews on the Turkish frontier, who regard the debased Spanish their ancestors brought with them from the Peninsula as their sacred language.

It need hardly be remarked that the Agaou and its dialects are not Semitic; that is to say, they do not belong to that family of speech of which Hebrew and Arabic are the best-known members. But they appear to be related to a class of languages to which the title of sub-Semitic has been given, and which comprises Berber, Hausa, and other Libyan idioms. These, again, cannot be separated from old Egyptian and its modern descendant Coptic; and the striking similarity of the grammar, though not the vocabulary, of this group of tongues to that of the Semitic languages, offers one of the most difficult problems in comparative philology. Indeed, in old Egyptian the similarity extends beyond the grammar to the pronouns and numerals, and even some of the roots; and since languages are scientifically classified, not by their dictionaries but by their grammars, it would seem that at some remote period both the Semitic and the sub-Semitic languages had a common ancestor. It is possible that the Egyptian of the ancient monuments and the parent of the Semitic languages were sister-tongues. Even jargons so far removed as that of the Falashas from Hebrew or Arabic in space and time and culture, still show a remarkably Semitic colouring in their grammar, as may be seen from the sketch of it given by M. Halévy. He has added some comparative vocabularies and phrases, besides an interlinear translation of the Book of Jonah, a few short prayers, and the "grace" recited by the butcher while slaughtering an animal. The grace is addressed to the "God of Israel," and ends with a repetition of the first two commandments.

M. Annessi's paper is a welcome continuation of the philological researches already reviewed in the ACADEMY of December 1, 1873. The theme of the Semitic languages is traced from a locative signification to its use as a mark of the state and as a preformative of the participle, and then as a pronoun and an interrogative and negative particle. M. Annessi derives considerable aid in his researches from old Egyptian, and affords further proof of its relationship to the Semitic languages. A number of inter-

esting points are suggested in the course of his "study," which cannot, however, be discussed here. Like its predecessor, the monograph may be heartily recommended to the attention of the student.

A. H. SAYCE.

MODERN SYRIAC.

Neusyrisches Lesebuch. Texte im Dialecte von Urmia. Gesammelt, übersetzt und erklärt von Adalbert Merx, Th. u. Ph. D., Professor der Semitischen Sprachen an der Universität Tübingen (now of Giessen). (Breslau, 1873.)

THOSE who enjoyed the privilege of hearing Professor Max Müller's address as president of the Aryan section of the Oriental Congress, will remember the stress he laid upon the philological importance of recording the various dialects spoken by barbarous races. His remarks apply also, though with less force, to the study of modern and changing forms of older languages. The philological import of such studies is of course of quite a different nature from that of barbarous dialects, but it is not the less valuable in its way. The study of modern Arabic has its value; and a reference to Professor Wright's Arabic grammar will show that he has known how to turn the modern language to account in the treatment of the comparative grammar of the Semitic languages. To use Dr. Merx's simile: the utility of the study of the Neo-Semitic languages is like that of geology, which turns the knowledge of formation and development gained by listening to the living world of nature around us, or worked out by experiment, to the explanation of the riddling formations which the earth hides from us in her womb, and to the understanding of their history.

Dr. Merx is one of the first to publish a work on Modern Syriac. The first part of the Reading-book consists of a series of popular tales, written down by Odishu bar Arsánis; the second part contains a number of letters, chiefly from ladies to ladies, selected (as Dr. Merx informed the writer) in order that people might become acquainted with the feminine vocabulary and the feminine manner of speech as well as the masculine. Probably the difference between the language of a woman and of a man is not very great; but Dr. Merx is right in securing those differences, slight though they may be.

The tales and letters are accompanied by German translations in parallel columns, and all words which are peculiar to modern Syriac, not being found in the old language, are noted and explained at the foot of the page. The first tale, the Story of Began and Zal, bears evidence to the fact that in the present day the old Persian stories are still common among the people of Syria; for Dr. Merx traces this tale to the Sháh Náneh. This alone is curious, and a comparison of the present form of the tale with the old version would be interesting. Not the least important part of the book is the transliteration of the first chapter of St. Luke's Gospel in Syriac, and of a couple of Syriac poems. The transliteration is according to the pronunciation of Odishu bar Arsánis, and if

Dr. Merx's ear is sufficiently acute and disciplined, this part of the *Lesebuch* may perhaps have a value for students of phonetics.

STANLEY LANE POOLE.

The Book of Common Order, commonly called "John Knox's Liturgy," translated into Gaelic A.D. 1567 by Mr. John Carswell, Bishop of the Isles. Edited by Thomas M'Lauchlan, LL.D., translator of "The Book of the Dean of Lismore." (Edinburgh: Edmonston & Douglas, 1873.)

THE reason for republishing the *Book of Common Order* was, that it had got so scarce that only one perfect copy of it was known, namely, the one in the library of the Duke of Argyll. Two other copies are mentioned, one as being in the British Museum, and the other in the library of the Edinburgh University, but both are said to be imperfect. How anxious Celtic scholars had become respecting this book may be judged from the following extract from a letter addressed to the editor by the Rev. Dr. Reeves, of Armagh:—

"Having lately learned that of the only three known copies of the work but one is perfect, and that that one is in private possession, namely, in the library of his Grace the Duke of Argyll, and subject to all the contingencies in the many degrees which occupy the space between the four cardinal points of mischief—fire, damp, worms, and thieves—my anxiety has become more intense, and I have resolved on appealing to you to take active steps for the perpetuation of this literary treasure. Here is a chapter in the history of Scotland, and much more, a mine of philological treasure in one important branch of the most interesting language in existence—combining all the charms of living excellence, and all the prestige of unfathomable antiquity, and this on the verge of extinction—one life in a lease of incalculable value! Oh, do try and convert that terminable lease into one of lives renewable for ever."

The work is preceded by a short preface by the editor, and a series of most interesting notices of Bishop Carswell, of whom Scotland justly feels proud. The plan of the work consists in giving an exact reprint, word for word and line for line, of the Gaelic translation: at the bottom of each page the English text is given. The whole has been executed in a manner highly creditable to both editor and publishers. J. RHYS.

NOTES AND NEWS.

Out of Doors: A Selection of Original Articles on Practical Natural History. By the Rev. J. G. Wood, M.A., F.L.S. (Longmans.) The title of this book sufficiently explains its character. It is a collection of popular articles on subjects of natural history communicated by Mr. Wood to various periodicals, and exhibiting his usual skill both of description and dilution. It will be sure of a welcome among those who do not seek for science in a stronger form, and will help many to become observers of the living objects about them. The "Medusa and her Locks," as one of the papers is termed, gives a striking account of the author's sufferings from contact, when bathing, with the stinging apparatus of the *Cyanea capitata*, the most formidable of the so-called "jelly fishes" inhabiting the seas round our coasts. Not only did he experience a fearful stinging, but also sharp pangs shooting through the chest, gaspings for breath, and disturbance of the heart's action. "For more than three months the shooting pang

would occasionally dart through the chest." Mr. Wood's condition of more than ordinary sensitiveness to the poison darts of the Medusa was, no doubt, compensated by the opportunity it afforded him of writing the present description, which might supply Victor Hugo with suggestions for a sea-monster more horrific than the famous cuttle-fish in the *Toilers of the Sea*. The book is nicely printed, and illustrated by several wood engravings.

THE *American Naturalist* for October has for its principal article a reprint from *Silliman's Journal*, with some corrections, of Professor A. M. Meyer's paper on "The supposed Auditory Apparatus of the Mosquito." He cemented a live male mosquito to a glass slide, which he placed under a microscope, and viewed the well-known branching antennae with a one-fifth objective. He then sounded a number of tuning-forks near it, and found that particular notes caused some of the fibrils to vibrate, while others were quiescent. A fork marked U_4 of König's series, giving 512 vibrations in a second (corresponding with the C below the line), produced a considerable amplitude of vibration in one of them, and another fibril vibrated still more under the influence of fork U_3 . Other fibrils responded to other notes, so that the Professor infers from his experiments on about a dozen mosquitos, that their fibrils are tuned to sounds extending through the middle and next octave of the piano. He supposes the superior development of the antennae of the male gnats enables them to hear the sounds emitted by the females, which vary in pitch. As the sound-waves operate more powerfully upon the fibrils when they strike them sideways than when they approach them at right angles, the creature may, by moving its antennae to the most favourable position, become acquainted with the direction from which the sound proceeds.

Bulletin de l'Académie Royale des Sciences, des Lettres, et des Beaux Arts de Belgique, 1873, No. 11. Among the papers in this report of the work of the Belgian Academy, is one by M. Terby, giving the results of observations on Mars and Jupiter in 1871 and 1872-3. It is illustrated by fourteen figures of Jupiter and twelve of Mars. The Jupiter drawings exhibit some remarkable changes in the two polar "calottes" or dark parts. In 1872, the north polar region was usually darker than the southern, while in 1873 the contrary was often the case, though the southern one was always of smaller dimension. The drawings also exhibit curious variations in the shape of the belts, as seen at successive dates when the rotation of the planet caused it to present the same portion of its surface to the observer. The Mars sketches may be advantageously compared with Browning's stereographs, and with drawings he published in the *Intellectual Observer*, vol. xii.; but M. Terby's telescope, only "9 centimètres of useful aperture," or little more than $3\frac{1}{2}$ inches, could only give a distinct view of the more delicate markings in exceptionally fine weather.

M. TELLIER has described to the French Academy an apparatus for preserving meat, by keeping it in a cold dry chamber. The novelty of his plan consists in the employment of methylic ether, a substance that is gaseous at ordinary temperatures and atmospheric pressure, but which can be reduced to the fluid state by a pressure of eight atmospheres. The methylic ether is condensed and then allowed to expand in contact with metal compartments containing a solution of chloride of calcium, which it reduces to a low temperature. Air is blown through this apparatus, its moisture is deposited as hoar frost on the metal, and it passes in a dry and cold state to the chamber in which the meat is placed. It is found that the flavour of the meat is not injured by retention in this situation for forty or forty-five days, after which, although it remains sound, it has a greasy taste.

DURING a recent balloon ascent of MM. Tissan-

dier and De Fonvielle, of which they communicated particulars to the French Academy, the latter made observations suggested by Mr. Norman Lockyer, on the effect of rapid ascension in modifying the solar spectrum. Three observations were made at heights between 1,000 and 1,500 mètres, and it was found that the blue had invaded the space occupied by the indigo and violet, but the red remained sensibly the same as on the earth. When the balloon was above a cloud that prevented a view of objects on the earth, the aeronauts heard voices and remarks which showed that the people could see them. Thus it appears a cloud may be opaque in one direction and transparent in another.

THE Abbé Castrucane, in a paper communicated to the French Academy, states that he discovered fossil diatoms in a lignite from Wieliczka and in one from a lower miocene formation near Urbino. Seeking to trace them further back in geological periods, he reports his success in coal from Liverpool, Newcastle, and St. Etienne; and in cannel coal from Scotland. He states the fossil form to be identical with living ones, and claims such facts as a proof of the immutability of species. The Abbé's facts are more valuable than his reasoning. That certain forms persist, affords no proof, or evidence, that different forms do the same. The permanence for immense periods of lower types arises from their wants being of a simple character, that can be provided for under a great variety of conditions. This is the case with existing diatoms.

M. SCHLOESING has shown experimentally that plants absorb and assimilate the ammonia of the atmosphere in the way that has been supposed, but not before demonstrated. He grew two plants of tobacco in the same soil under bell-glasses, supplying both with fresh air. In one case he added some sesquicarbonate of ammonia in very dilute solution, placed at the bottom of the apparatus each day. Between July 31 and September 14, 1.93 grm. of ammonia were volatilised in the atmosphere of one glass, while the other glass received none. Analysis then showed that the plant which grew in the ammoniated atmosphere contained 2.22 per cent. of nitrogen, and the other one only 1.77 per cent., the former being the normal quantity. Although the ammonia must have been absorbed by the leaves, its nitrogen did not remain in them, but was diffused throughout the plant, including the roots.

M. THIBAUT has arranged, in the super-phosphate of lime works of M. Michelet, an apparatus for separating from the phosphate employed the small portion of iodine it frequently contains in the form of iodate of calcium, and which sometimes amounts to a two-thousandth part, at others to a mere trace. He states that his plan adds very little to the cost of making the super-phosphate, and he expects it will be found profitable, as iodine is very dear. The phosphates of Lot, of Nassau, and of Estremadura contain iodine.

Der Naturforscher, No. 42, gives the results of spectroscopic observations of the August meteors on the 8th, 10th, and 12th, made by Herr Konkoly and two assistants at the O Gyalla observatory. About 130 of these bodies, from first to fourth magnitude, were examined. In each case the nucleus of the meteor gave a continuous spectrum. Those which looked yellow to the naked eye gave a spectrum with yellow prevailing, and those which looked green to the naked eye showed most green in the spectroscopic. No violet was seen in any case, indigo was rarely visible, and red only in particularly red meteors. The luminous tails of yellow meteors gave the sodium line as a band, the green magnesium, and the red strontium, or perhaps lithium. Meteors bigger than Venus, whose tails were luminous from 30 and 40 to 156 seconds, allowed spectra to be seen for some time, and one as long as thirty seconds gave indications of sodium, magne-

sium, iron, and a number of bright bands in the green and blue.

THE imbibers of kirschwasser will be surprised to learn from M. Boussingault that the test which has been supposed to prove the genuineness of that liquor is quite fallacious, as its indications show the presence of copper derived from the stills employed in the manufacture. M. Rouis first noticed that gum guaiacum acquired a blue tint from kirschwasser containing copper, and M. Boussingault not only confirms his statement, but says that he obtained a decigramme of the metal (rather more than one and a half grain) from a litre of the liquid.

M. HENRI PARVILLE states in the *Débats* that MM. Champion and Pellet have shown in a manner more striking than was done by Mr. Abel, that certain explosive substances may be caused to detonate by mere vibrations. They exploded iodide of nitrogen by the notes of a violin and a tontom.

M. IS. PIERRE mentioned at a recent sitting of the French Academy that if a hand either touches, or is held over, the meadow saffron (*Colchicum autumnale*), when its flower opens, the skin assumes a livid, greenish-yellow tint, like that characteristic of a body commencing decomposition. In about ten seconds the usual colour returns. If, however, the hand is exposed for some time to the action of the flower, a numbness is occasioned, which lasts for several hours. He ascribes this action to a volatile body that has not yet been studied.

THE Swabian *Mercury* announces that Heidelberg will soon lose the services of Professor Kirchhoff, who has accepted a post at Berlin, and will leave the Baden University early in the spring.

THE *Theologisch Tijdschrift*, published every other month at Leyden, continues to present its readers with a series of—always interesting and often brilliant—specimens of critical theology, and of its application to the circumstances of the Church. The May number contains a paper by C. P. Tiele, author of a work on the comparative history of religions, which received much praise from the ACADEMY, on "The Laws of the Development of Religion," as deduced from the scientific study of its historical forms. He shows by the testimony of facts that it is useless to expect religious reform unless a general growth in culture has preceded, and suicidal to delay it when the nation has reached a higher intellectual level. It shows too the danger of an individualism which would dispense with an organisation of teachers, and the essential fragility of religious systems which have no support in the past. Professor Kuenen exposes the crudities of the first volume of Grätz's *History of the Jews*, arising mainly from his exaggerated religious prejudices. The July number has not reached us. That for September opens with a valuable paper by A. G. van Hamel on "Religion without Metaphysics." The author represents a small but influential school in Holland who hold views approaching to those of Mr. Matthew Arnold among ourselves, though Van Hamel is distinguished from the brilliant essayist by his avoidance of unhistorical views on the subject of Jewish religion. Both writers regard Christianity as "moral idealism," and current Christian forms as merely poetical symbols; but Van Hamel seems inclined to believe that the old expressions must, until we can use them more naturally, be banished from our lips, as Zwingli banished the organ from his churches as a source of Romish superstition. J. J. Prins discusses the alterations introduced by Tischendorf in his new edition in Rom. i.—vi.; the most important for exegesis are ch. iv. ver. 1, 19. H. U. Meyboom reviews Mr. Stewart's pamphlet on *The Plan of St. Luke's Gospel*; he comes to a similar conclusion with our own reviewer (ACADEMY, vol. iv. p. 310); and a Dutch work on St. Luke, by Vos. A. D. Loman reviews

favourably an important, extremely radical work on St. Paul, by J. W. Stratman, which we hope to review ourselves shortly; and Grau's work on the Critical History of the New Testament, which he pronounces deficient in critical sense. And lastly, Rauwenhoff gives a sympathetic account of the eminent Scottish theologians, Duncan, Candlish, and Guthrie.

THE October number of the *Theological Review* contains a paper by Miss Cobbe on "Evangelical Character," tracing in a sympathetic spirit the good and evil results of Evangelicalism; followed by an essay on "Dogmatic Decay," by Mr. Geldart, who takes a hopeful view of the religious future, and reminds dogmatists of all schools that history forbids the hope that any great controversy will be finally settled, though it may be merged in another of graver import. Dr. Farrar's *Life of Christ* could not have been put into better hands than those of Mr. Kegan Paul, who has treated his subject with perfect courtesy and generosity, without any unfaithfulness to his own convictions. He has even succeeded in finding a "peroration of a chapter, which seems to us as good as anything can possibly be." The critical value of the book appears to be nil. Mr. Bell criticises Mr. H. Spencer's book *On the Study of Sociology*; and Mr. Alexander Gordon gives a lively, and withal instructive, account of "the great Laird of Urie," Robert Barclay, the author of the great Quaker *Apologia*.

MEETINGS OF SOCIETIES.

ENTOMOLOGICAL SOCIETY. (Monday, Nov. 2).

SIR SIDNEY SMITH SAUNDERS, C.M.G., President, in the Chair.

Mr. Stevens exhibited three specimens of *Detopsea pulchella* taken at Arundel and Deal. Professor Westwood remarked that the late Brigadier-General Harsey had found this insect very destructive to gardens in India.

Mr. Bond exhibited specimens of rare Lepidoptera: amongst them were *Sesia calciformis* (with white bands), *Limacodes asellus*, *Nola albuleus* and *Pterophorus rhododactylus*.

Mr. Jenner Weir exhibited specimens of *Mantis religiosa* with some egg-cases taken by himself at Meran in the Tyrol.

Mr. McLachlan exhibited a printer's block (such as is used for printing posters), attacked by a species of *Anobium*, and he was informed that the insect was causing serious damage to the printer's stock. The wood was believed to be pear-tree. He had recommended soaking them in carbolic acid and water.

Dr. Sharp communicated "Descriptions of some New Genera and Species of *Poelaphidae* and *Scydmaenidae* from Australia and New Zealand." He added some remarks respecting the importance of gaining a knowledge of the New Zealand fauna, and commented on the probable extinction of many of the species at no very distant period.

Mr. Darwin communicated some remarks by Mrs. Barber, of Griqualand, South Africa, on the larva of *Papilio Nireus*, and especially with regard to the colour of the pupa in connexion with the objects on which it was placed; it appearing to assume a protective resemblance to the leaves or other adjacent objects. A discussion took place between several of the members as to whether, as suggested by Mrs. Barber, some photographic influences might be at work; but Mr. Meldola stated that no known substance retained, permanently, the colour reflected on it by adjacent objects; but that there was no difficulty in believing that larvae might become affected in colour by the colouring matter of the food-plant, since chlorophyll in an unaltered condition had been found in the tissues of green larvae.

Mr. Ogier Ward sent some notes on a spider's nest found in a quarry at Poissy, near the Seine; with remarks thereon by Mr. C. O. Waterhouse.

Mr. Butler communicated "Descriptions of three new Species and a new Genus of Diurnal

Lepidoptera from West Africa, in the Collection of Mr. Andrew Swanzy."

Mr. C. O. Waterhouse read "Notes on Australian Coleoptera, with Descriptions of New Species."

Mr. Kirby contributed a Review of Boisduval's "Monographie des *Agaristidae*, published in the Revue et Magasin de Zoologie, 1874."

The Rev. R. P. Murray communicated "Descriptions of some New Species of Butterflies belonging to the genus *Lycaena*."

BURLINGTON FINE ARTS CLUB (Thursday, Nov. 5).

ON the 5th inst. Mr. H. V. Tebbs gave a lecture at the Burlington Fine Arts Club on "Greek Coins in relation to Greek Art," on the occasion of exhibiting his fine series of electrotypes.

Having spoken of the happy combination of circumstances which favoured the growth of Greek art, Mr. Tebbs sketched its history and described its developments on the authority of the coins. Adopting Professor Ernst Curtius's theory of the origin of money from the necessities of the temples, he spoke of the earliest electrum and gold coinages of Asia Minor and the contemporary silver money of Hellas and the islands. The progress of the type was well illustrated by the electrotypes, from which not one leading variety was omitted. The oldest coins were believed to be of B.C. 700, the archaic style lasting till 500, the transitional from 500 to 450, and the fine from 450 to 336. The exact definition of these periods was not possible, owing to the local influences which forwarded or retarded the growth of art, but these figures might be accepted as giving the mean dates. It was significant that the period of fine art reached from the rise of Pericles to the accession of Alexander. During this whole time the types were sacred, bearing reference to the worship of the temple which coined the money, and no portraits occurred on purely Greek coins until that of the deified Alexander was struck by his successors.

In treating of the different schools of art traceable from the coins, Mr. Tebbs adopted the following classification:—1. Central School of Greece Proper; 2. Ionian; 3. Macedonian; 4. Asiatic under Persian influence; 5. Cretan; 6. Cypriote and Rhodian; 7. Sicilian and Italian. This part of his lecture was a development of a theory proposed by Mr. R. S. Poole in a lecture given at the Royal Institution, May 27, 1864, in which a somewhat less minute division was attempted. The collection exhibited afforded a proof never before attempted of the general soundness of this theory so far as it rests on the essential difference of Greek art as seen in the coins of various parts of the Greek world.

On the conclusion of the lecture Mr. Poole spoke of the service Mr. Tebbs had rendered to the study of art by his careful formation of the collection, and the full and critical account of it which he had now given. He also referred to the fine series of Greek gold coins and regal portraits, and stated that so large and complete a collection had never been seen together before.

ROYAL ARCHAEOLOGICAL INSTITUTE OF GREAT BRITAIN AND IRELAND (Friday, Nov. 6).

THE inaugural meeting of the Institute for the session 1874-5 was held at the rooms, No. 16 New Burlington Street, on Friday, November 6, at 4 P.M., Sir Sibbald D. Scott, Bart., in the Chair. The chairman congratulated the members present on the flourishing condition of the Institute, on the generally improved state of public feeling as regards the study of archaeology, and upon the brilliant success of the Ripon Congress in July last. Mr. W. H. Tregellas then gave some particulars of the principal points of interest connected with that meeting, and, among other matters, referred to his personal discovery, in a Breton church near S. Pol de Léon, of an alabaster slab representing the Resurrection, which

was an exact facsimile of one in the Minster Library at Ripon. The Rev. W. J. Loftie added some remarks on the exhibition of manuscripts. The chairman then called upon Sir John Maclean, who gave an account of the recent presentation, by the Institute, of a municipal chain and badge to the Mayor and Corporation of Exeter, after which the ordinary business of the meeting proceeded. Papers were read on "Recent Discoveries at Carnarvon Castle" by Sir Llewellyn Turner, deputy-constable of the castle, and on "An Inscription recording the Building of St. Chad's Church, Stafford," by John Hewitt, Esq. Among the objects of interest exhibited were—a collection of rings and seals lately found at Fountains Abbey, and lent by the Most Noble the Marquis of Ripon; a curious fragment of a processional crucifix found at Strettham, near Ely, by the Rev. C. R. Manning; and a pair of Moorish spurs and an inlaid Persian belt-clasp, supposed to have belonged to Nadir Shah, exhibited by John Henderson, Esq. Notice was given of a proposed exhibition, during the coming session, of municipal badges, and the proceedings terminated.

PHILOLOGICAL (Friday, Nov. 6).

REV. DR. RICHARD MORRIS, President, in the Chair. The President made a report to the meeting on the services rendered to Comparative and English Philology by Professor William Dwight Whitney, of the United States, and said that the Council would propose him to the society at its next meeting, for election as an honorary member. Mr. Alexander J. Ellis also spoke in favour of Professor Whitney's claims to recognition by the Philological Society. The papers read were—1. "On the Etruscan Numerals," by Professor Aufrecht, Part I., in which he expressed dissent from Corssen's interpretation of the Etruscan numerals, pronouns, &c. 2. "On the Rushworth Gloss or Versions of the Anglo-Saxon Gospels," by Dr. James A. H. Murray. 3. "On the Treatment of final *m* in Latin," by Alexander J. Ellis, Esq., an expansion of the views already given by the writer in the ACADEMY, showing that final *m* was not pronounced, but only lengthened the preceding vowel.

PHYSICAL SOCIETY (Saturday, Nov. 7).

A PAPER by Mr. G. F. Rodwell, describing a mechanical arrangement for the "Multiplication of Small Motions," was read by Professor Reinold, honorary secretary. The apparatus consisted of a train of multiplying wheels acting on an index arm traversing a graduated circle, or on a mirror by which a ray of light could be reflected on to a screen. Mr. Rodwell proposed to use it for exhibiting the expansion of solid bodies by rise of temperature, and the elongation of an iron bar on magnetisation. The next paper was by Professor G. C. Foster, F.R.S., "On the Geometrical Treatment of certain Elementary Electrical Problems." The object of this communication was to call attention to a method of expressing the relations between electrical quantities that has long been in partial use, and to apply it to cases to which, so far as the author knew, its application had not been previously pointed out. The method consisted essentially in the representation of electromotive force and resistance by rectangular co-ordinates, and the problems to which it was applied were: (1) the calculation of the quantity of heat evolved in a galvanic circuit, and its distribution in the circuit; (2) the calculation of the permanent resistance and electromotive force of a galvanic battery from two deflections of a tangent-galvanometer; (3) the determination of the joint resistance of several conductors combined in multiple-arc; and (4) the determination of the distribution of potential and strength of the currents in the various parts of a circuit formed by connecting the similar poles of two unequal batteries with the opposite ends of the same conductor. A paper was also read by

Professor Guthrie, F.R.S., "On Salt-Solutions and Water of Crystallisation." The author had ascertained that many salts which crystallise under ordinary circumstances without water of crystallisation, such as common salt, nitrate of potassium, chloride of ammonium, bichromate of potassium, and many others, crystallise with water at temperatures below the melting point of ice. In particular, common salt crystallises at -23° C. with ten or eleven molecules of water, forming a solid hydrate which melts in its water of crystallisation at the same temperature (-23°). Professor Guthrie pointed out that this temperature coincided with the lowest temperature attainable by a freezing mixture of ice and salt, and that the brine produced when ice and salt mutually liquefy each other, consists of the crystallisable hydrate in the liquid state. The other similar hydrates likewise melted in their water of crystallisation below 0° C.

ROYAL GEOGRAPHICAL SOCIETY

(Tuesday, Nov. 10).

THE session of the above body was commenced on Tuesday evening, when Major-General Sir Henry C. Rawlinson, K.C.B., took the chair, the hall of the London University being filled with a distinguished and crowded audience, among whom were His Royal Highness the Duke of Edinburgh, His Imperial Highness the Czarewitch, Count Beust, the Right Hon. Sir Bartle Frere, the First Lord of the Admiralty, Sir Alex. Milne, Lord Houghton, and many other notable personages.

In the course of the opening address, the President touched upon the chief geographical events of the last few months (notices of which have duly appeared in the "Travel Notes" of the ACADEMY), and passed in review the principal papers read before the British Association. The recent journey of Mr. Wiggins, in Mr. Lamont's steamer *Diana*, to the Sea of Kara and the mouth of the Obi, though not contributing directly to the cause of geography, deserved notice. With reference to the prospect of an English Arctic Expedition, the President informed the meeting that the question had been referred by the Prime Minister to the Lords of the Admiralty, and he (Sir H. Rawlinson) hoped, nay expected, that a favourable decision would soon be arrived at. In mentioning some of the new geographical works which are expected to appear shortly, the President mentioned that he had had the opportunity of seeing the first volume of Livingstone's Journal and that it promised to be a most instructive work.

Lieutenant Julius Payer was then presented to the meeting amid great cheering, and the secretary, Mr. Clements R. Markham, proceeded to read a narrative of the Expedition, which had been written in German by Lieutenant Payer, and translated into English by Mr. Ravenstein, F.R.G.S. We do not propose to reproduce the details of this narrative, as they have already been made known through the medium of our columns as well as those of other journals, but we must not omit to put on record a new recipe for making wine which the Austrians found most efficacious. This consisted of a mixture of glycerine, tartaric acid, sugar, alcohol and water. At the close of the paper, Lieutenant Payer delivered a short address in German, in which he described the manner in which the members of the expedition had been picked up by Russian sailors as well as the kindness experienced from both them and the Norwegian people on their return through the country. An extract was then read from a letter by Dr. Petermann, printed at length elsewhere, in which the learned geographer of Gotha expressed satisfaction at the prospect of an English Arctic Expedition.

After Sir E. Belcher had proposed, and Admiral Collinson had seconded, a vote of thanks to Lieutenant Payer, Count Beust, the Austrian ambassador, acknowledged the compliment in a

characteristic speech, in which he alluded gracefully to the important services rendered both to diplomacy and science by Sir Henry Rawlinson. The meeting then concluded with three hearty cheers for the Duke of Edinburgh and the Czarewitch.

In connexion with the above we must not omit to mention that at the Society's rooms in Saville Row there are now being exhibited a series of sketches and running surveys executed by Lieutenant Payer, the former of which illustrate incidents in the drift of the vessel northwards and in the various sledge expeditions, and thus form a very appropriate complement to the narrative with which English readers have been made familiar.

ANTHROPOLOGICAL INSTITUTE (Tuesday, Nov. 10).

THE first meeting of the Session was held on the 10th inst., Professor Busk, F.R.S., President, in the Chair. Mr. F. W. Rudler read a full digest of the proceedings of the Anthropological Department, to which he acted as secretary at the Belfast meeting of the British Association; and Mr. Hyde Clarke contributed a report on the Anthropological Section of the International Congress of Orientalists, held in London.

Colonel Lane Fox then read a paper on a series of flint and chert arrow-heads, flakes, &c., from Patagonia, with some remarks on the stability of form observable in stone implements. The collection, which was the largest and most complete that had yet been brought to England, was lately made by Mr. W. H. Hudson in the valley of the Rio Negro along the banks of the river, over a distance of ninety miles from its mouth. The arrow-heads and other articles of native workmanship were generally found on the sites of ancient villages either on the margin of the river itself or on the long winding lagoons, now mostly dry, with which the valley is everywhere intersected. One of the chief points of interest connected with the discovery of these arrow-heads was the fact that their use had been abandoned by the Tehuelches and other tribes inhabiting Patagonia for some centuries past, but at what period their disuse began, or what causes led to their being abandoned over so large a portion of the continent, there was insufficient evidence to show. After giving a detailed description of the series exhibited and of the various types it contained Colonel Fox was able to demonstrate with certainty that the weapons of the early inhabitants of the Rio Negro were nearly identical in form and were probably similar in development with those of the United States. In drawing his inferences from an examination of these and other forms of weapons, the author remarked in conclusion, that if we study the implements of savages we must endeavour to regard them as savages would have done. Trivial as some of the details may appear to us, we should bear in mind that to the Indian living by the chase, an improvement, for instance, in the mode of fixing an arrow-head, affecting, as it does, his means of subsistence, must have been of far greater importance than an improvement in a telegraph or a steam engine can be to us, and must therefore have received the attention of the best intellects of the time. And as it is only by the gradual evolution of scientific ideas that modern improvements have originated, so we must look for similar stages of evolution in the simplest arts. In attempting to solve the problem as to the unity or diversity of origin of the culture belonging to different geographical areas, it is only by comparing through these details like courses of development in distant lands, that we can approach with any hope of success what Professor Nilsson has justly termed "one of the great, still unsolved, enigmas of anthropological science."

The Director announced that the Council had determined to extend the scope of the Journal of the Institute by the publication of bibliographical notices, abstracts, and short reviews of works and

papers relating to anthropological subjects, and other miscellaneous matter interesting to anthropologists.

FINE ART.

THE NATIONAL MANUFACTURES OF FRANCE.

I began one of my last letters by saying that I intended to speak of the national manufactures of France; instead of which I confined myself to the constitution and exhibition of the Central Union. Life is full of these unaccomplished projects—but I am not going to put you off with this excuse. I have, however, so little love of Government management, I mistrust so thoroughly everything that depends for existence on the paternal support of the State, that I feel no regret for having first of all called your attention to a group of citizens who, at their own risk and peril, are founding in France a great institution, and who, equally at their own risk, produce day by day works which are to France a continual source of riches and splendour. The claims of such men are urgent: national manufactures can wait.

Our national manufactories of Gobelins, Beauvais, and Sévres are royal, not, as currently stated, by origin, but by absorption. Royalty did not create, it only adopted them: it took them from the hands of private enterprise which had started them, and it reconstituted them after its own likeness—that is to say, with all its outward attributes of luxury and riches, and all the concomitant narrowness and abuses. These privileged manufactories are no longer in harmony with the spirit of the age, and they need fundamentally remodelling. They may be compared to that old wooden machine of Marly which conducted the waters to Versailles. It used to be set in motion two or three times a year, and each time it had to be repaired at a cost of some 20,000 francs. The terrible groans which it gave forth were heard for miles in the country. The public occasionally flocked to Versailles in the hope of seeing a grand aquatic performance, and for its reward beheld basins half filled with water, Tritons bathing in mud, and water-spouts puffing like tea-kettles. "The machine of Marly is so old!" was invariably the excuse, and the old folks were full of indulgence for the infirmities of this venerable machine; but the younger sort could not help regretting the money spent on an excursion which would have been much more lively and profitable in the woods of Montmorency or in the forest of Fontainebleau. One fine day some inventive person replaced this wooden mill by iron springs, and ever since then the "grandes eaux" of Versailles have performed with the regularity of clockwork.

The brothers Gobelins were originally journey-men tapestry-makers who came from Rheims, the centre of a great tapestry trade, towards the end of the fifteenth century, and established themselves at Paris on the banks of the little river Bièvre. The waters of this river, to which Rabelais in his *Pantagruel* attributes a strangely grotesque origin, have always been supposed to exercise a salutary action on the dye of the wools. This is a fallacy. The only water used at the Gobelins comes from the Seine or from a deep well.

The Gobelins family made an enormous fortune, and one of them even became Marquis of Brinvilliers, and the husband of that famous poisoner who rendered such terrible service to the whole court of the Great King. The hôtel of the Gobelins, with the extensive lands belonging to it and all the necessary appliances for carrying on the trade, was bought by Colbert on the King's account and made into a kind of *Summer Palace*. In 1662 the painter Lebrun was appointed director of the establishment, which comprised the whole body of working artists in the pay of the sovereign: tapestry-makers, dyers, embroiderers, jewellers, founders, lapidaries, cabinet-makers, &c.

Louis XIV. seems to have had many points in common with Asiatic monarchs.

The most delightful epoch of the Gobelins manufactures is marked by the directorship of the painter Boucher. The works produced under the superintendence of this skilful artist and of his pupils—landscapes, and mythological and rural scenes—are masterpieces of grace, humour, and clearness of execution, and show a thorough knowledge of the laws of decorative art. Under the First Empire it became the fashion to copy the oil-paintings of Gérard or Girodet, and even those of the old masters. The academic school, without any sense of fitness, had confused all sound notions of art. It did not distinguish between the cartoons of Raphael at Hampton Court, in which the decorative purpose is strongly pronounced by the quality of touch and tone, the modelling being kept simple, and expressed by the juxtaposition of flat tints of great sobriety, and the Holy Family of the same master, which is essentially an oil-painting, and which Raphael could not have conceived being rendered in any other way than by a brush painting in colour on panel or on canvas. This absurd practice has been perpetuated, and the consequence is that tapestry-makers have spent their time and talents, and the State enormous sums of money, in producing results which have added no glory either to the history of art, or to that of reason.

After September 4 M. Jules Simon thought fit to send back to Beauvais M. Badin, director of the Gobelins, formerly a painter, and a man of considerable merit. M. Badin was replaced by one of the curators of the Louvre, M. A. Darcel, whose attention had, till then, been confined to pottery. Articles, however, published here and there by this gentleman on the Archaeology of the Middle Ages, led one to hope that attention would now be called to a period of French art in which the science of simple and expressive decoration reached a point not surpassed even by the Italian Renaissance. This hope was vain. The new director contented himself with a slavish execution of the orders he received from the Minister of Fine Arts, and he is even said to have had mounted in frames panels destined for the refreshment-room of the New Opera House. The models used had been ordered by M. Garnier from M. Mazerolles, one of the most vulgar of decorators; and the public, on their admission to the gallery devoted by the Central Union to the Gobelins, have been scandalized that so much money and so much labour should have been spent on the reproduction of pictures far inferior both in style and in conception to those which may be seen any day in the cafés of the Boulevards. Of the skill of the artists employed in copying these pictures there is but one opinion. The exquisite colours of the wools used, the evenness of the work, and the exact resemblance of the copies to the originals are unequalled. The fact is that these artists are all subjected to a very severe training. There is at the Gobelins a daily course of instruction in drawing, one week from antique casts, another week from living models, which every tapestry maker is compelled to follow until he obtains a medal. It is much to be regretted that owing to the great expenses of management, the ruinous outlay in salaries, pensions, &c., the productions of this manufactory are beyond the reach of even the wealthiest private buyer, and are only available for state presents. But, I must repeat it, however remarkable these productions may be for beauty of execution, they are wanting in the higher qualities of imagination in arrangement, and spirit and vivacity of treatment, which give to a school its real title to authority. The ex-Empress was pleased to revive the style of Louis XVI. This fashion was servilely followed, and crowns and ciphers in *rose pompon* suspended by smart bows in the centres of screens and panels effectually checked all efforts after a manlier and more modern style of decoration.

The manufactory of Beauvais produces little in

the way of figures. It is true that it has exhibited here a few copies from the pastoral subjects of Boucher, and the hunting scenes of Desportes, but these are probably legacies of the Empire, and we have reason to hope that the enervating habit of slavishly copying old masters will in time be completely renounced. Beauvais possesses one artist of a very high order—M. Chabal Dussurgey. He confines himself to flower, fruit, and decorative painting, but the breadth and truthfulness of his touch, his complete mastery of grouping and colouring, and his rare combination of strength with delicate grace, entitle his works to a place among the most remarkable of our age. I believe that some years ago the South Kensington Museum bought from him a set of designs for sofas and arm-chairs which had been executed at the Gobelins during the first year of the Empire, or at the close of the Republic of 1848. M. Chabal Dussurgey is the author of a series of lithographed flower and fruit designs, printed in two colours, which have been of great service to industrial artists, and to the professors of drawing in popular schools. Thus you see that when once France shall have shaken herself free from the tyranny of rapacious administrators, she will have at her command a large staff of distinguished men ready to restore the national flag to its place of honour.

The exhibition of Sèvres manufactures provoked the most violent criticisms both from the public and, which is rarer still with us, from the press. Just as in the case of the Gobelins, there was, on the one hand, universal admiration for the beauty of the raw material, the skill of the painters, and the richness and delicacy of the enamels; and, on the other hand, disappointment at the poverty of the forms, the bad taste shown in the choice of designs, and the ugliness of the colours which hid a porcelain of the finest grain, the purest white, and the most brilliant enamel that is produced in all the world.

If you wish to gain some knowledge of the practical work of this famous manufactory, you should read an excellent little book which has just been published by Ch. Mourgues under the title of *Guide du Visiteur à la Manufacture Nationale de Porcelaine de Sèvres*. It is compiled from the notes of M. Robert, the present director of the manufactory, M. Salvétat the chemist, and M. Champfleury, head of the collecting department, and one of our most humorous story-writers; and it gives a concise and clear description of the processes of fabrication and composition which the pastes undergo, of the baking at high temperature, and of the painting of hard and soft porcelain. It also gives the complete series of marks used during the first royal epoch, from August 19, 1753, to September 21, 1792, during the Republican period, the Empire, and the Restoration, and the marks and monograms of the masters in gilding, painting, and decorating. The perusal of this book makes one feel strongly the importance and the utility of a collection which it would be impossible nowadays to replace,—that of which the celebrated chemist Brongniart was the acknowledged founder, but the real father the venerable citizen Riocreux, a zealous and unassuming man, who died a short time ago, after having rendered good service to all the potters of France and even of Europe.

The manufactory of Sèvres calls for the same reforms as that of Gobelins. So important a centre of high studies must not be allowed to disappear from France. If it had no better *raison d'être* than the glory of its triumphs in the past that would be sufficient. But it is still capable of producing perfect and beautiful work—witness some dozen specimens which may be seen at Sèvres, and of which the price, though certainly high, is immensely below the real value. These pieces are enough to distance private enterprise. It may with reason be urged that such masterpieces can only be produced under exceptional circumstances, by a manufactory which is not hampered by con-

siderations of cheap prices, or even of prices within the reach of the public, which exhibits nothing but work of the first order, and which need not dread strikes of workmen, or cessation of business, or changes of fashion. Money is nothing to a nation which, by the possession of a superior industry and a superior staff of workmen, commands victory in every international tournament, while at the same time there is no serious competition with commerce. For the present we must be content with giving advice, but whenever a time comes in which the great questions which affect the future of France can be satisfactorily dealt with, we shall aim at a thorough reform of this manufactory.

In the first place, we shall hope to get rid of those nondescript forms which are neither after the style of Louis XVI., nor in the least degree original. A state manufactory should never be reduced to repeating itself. One can understand that private industry might not be strong enough to resist the stream of fashion, but manufactures supported by the State enjoy, so to speak, relative perpetuity. If Sèvres under the Empire fell a victim to the tyranny of Court taste, she must now go to the sculptors for models of purer form.

Secondly, Sèvres must be induced to renounce the Neo-Greek style of decoration, which has neither vigour, sentiment, nor originality, and which is characterised by great figures of pale women or feverish youths, who have holes in the place of eyes, and who stretch out trembling hands like blind people. These figures, which seem to live in a lunar light or atmosphere, are made to move about among sharply-pointed ornaments, which sufficiently accounts for their halting gait and anxious countenances. Solon Milès, who is at present in England at the Minton pottery (for it is the glory of France to put new life into foreign industry), is the only artist who has produced pleasing effects in this style. The poetry and originality of his work are unequalled. He makes use of a process called *pâte rapportée*. The white *pâte*, by being subjected to enormous heat, melts and adheres closely to the metal base which supports it, and by this means a material is obtained which in compactness and translucency closely resembles the biscuit of Wedgwood, but is infinitely more supple.

Sèvres is also much reproached for not producing a larger supply of pure white porcelain, in the manufacture of which it has acquired a proficiency rarely attained by the Orientals; and another very desirable reform is a bold return to the use of the *pâte tendre*, which, from the nature of its composition, lends itself so much more readily to colouring than the *pâte dure* which will only take a limited number of colours, and those opaque ones, and the effect of which is always rough, hard, and inharmonious.

Lastly, it is melancholy to see a national institution setting national industry the deplorable example of making literal copies of paintings in oil. Everyone in the trade is striving after the abolition of this practice, for it is beginning to be understood that like combinations and effects cannot be produced with unlike materials.

I will not prolong my criticisms on faults which are redeemed by works of unequalled scope and power. Public opinion has been roused, and that is a good sign. In spite of royalist efforts we are entering on a new era. It was the much calumniated men of September 4 who decreed the exhibition of our national manufactures. Chance willed that this exhibition should take place side by side with that of the high art-industry of Paris. The comparison was a most instructive one, and showed plainly that our national manufactures err chiefly from want of intellectual activity. Under the Empire remarks and comparisons such as these were impossible. The manufactures were included in the department of the Civil List, and criticism stopped short at the threshold of a Cabinet minister.

The conclusion to which all this points is that sooner or later we must initiate a great parliamentary enquiry. Only let us do nothing in haste.

PH. BURTY.

ETCHING EXHIBITION AT THE LIVERPOOL ART CLUB.

THE exhibition of etchings at the Liverpool Art Club, to which we have already alluded, is one of a series which the members propose to hold, each exhibition being collected with a view to afford opportunities for the study of some special branch of art. The present is the fourth: the three previous ones being devoted respectively to Oriental art; the works of English water-colour artists born in the last century; and goldsmith's art. The present collection belongs to Mr. J. Anderson Rose, and is especially remarkable for the excellence of the impressions of living etchers. No exhibition could be more timely or instructive.

Artists and connoisseurs are reawakening to a sense of the almost unlimited capabilities of etching, but the art-loving public have still extremely vague ideas upon the subject. We constantly hear pen-and-ink drawings called etchings by those who really ought to know better. "Etching," as Mr. Rose, in his excellent introduction to the catalogue, explains, "is the art of graving with a needle on a varnished copper-plate, so that wherever the copper has been laid bare by the etching needle, aqua fortis poured on the plate bites in, but does not affect that part of the plate which remains covered with the varnish." "Dry point" is not strictly speaking etching, as it consists of engraving with an etching needle direct upon the copper; but it is so often employed to finish up an etching, and the nature of its results are so similar in character to those produced by the acid, that for practical purposes it may be roughly classed with etching. It is distinguished from line engraving by the nature of the instrument; that employed in engraving with the burin requires an amount of physical force in its manipulation which is fatal to that freedom of touch which is one of the etcher's chief advantages. We think, however, that the use of "dry point" ought not to be encouraged, because the incisions made by the etching needle are so delicate and shallow that after a few impressions the plate becomes worse than valueless, giving a totally wrong idea of the artist's scope and intention. Any one who has compared a fine impression of Mr. Whistler's *Forge*, like that of Mr. Rose (No. 521), with the ordinary published impressions, will at once see what we mean. The opposite to dry point is the process first employed by Mr. Seymour Haden, of etching entirely under the bath, that is, placing the plate in the bath, and allowing the acid to bite during the whole time the etcher is using the needle. The habit of mind and knowledge of art required for this process must be invaluable; if generally employed, it would strengthen our English school in many of the qualities it is chiefly defective in. The well-known *Breaking up of the Agamemnon* (No. 167) is an excellent example, and we cite it because many of our readers who have not had an opportunity of seeing Mr. Rose's collection may recollect it. Owing to the fact that all the darkest lines must be put in first, and in the order of their darkness, the artist must have the completed composition well in his head before he touches the plate, as well as the relation of every part to the whole. The effort of concentrated imagination necessary to success will of itself give a unity and individuality of feeling which will render the work instinct with life. It may be objected that these qualities are not wanting in the admirable "dry point" etching of Mytton Hall (No. 165) which hangs next to the *Agamemnon*, and this is perfectly true; but the qualities produced or encouraged by this process are not laid aside when the artist turns to other media of artistic expression. A man may have

these qualities and yet not etch under the bath, but if he does so successfully he must have them. If our readers will examine the *Agamemnon* carefully, they will see how each part of the composition has some portion of the tale to tell, and is distinctly put there to tell it, and to do nothing more. Many of the river and other landscapes of Mr. Haden, in which this collection is so rich, give the same invaluable lesson to many of our landscape painters, in whose work every object, though in some cases painted with wonderful accuracy and force, seems to have come there by chance, and half the trees seem to have lounged into the composition with their hands in their pockets, like Lord Castlereagh's crocodile. Hence the feeling of discomfort and unrest which is produced by most modern work, and the sense of peace which refreshes the nerves when we come upon a well-composed work.
